Re: Receiving Water Limitations Language (Provision A) in Draft Regional MS4 Permit

Dear Mr. Destache:

On November 13, 2012, the San Diego Regional Board will hold a workshop on the proposed Regional MS4 Permit. A major policy issue for the Regional Board to consider at the workshop is how the Permit should address compliance with water quality standards in receiving waters. Consistent with the Clean Water Act and prior decisions of the State Board, such compliance for MS4 discharges should be achieved over time, through an adaptive management approach. However, the 9th Circuit Court of Appeal has recently interpreted receiving water limitations language similar to that proposed in Provision A as requiring strict and immediate compliance with water quality standards. To respond to this recent interpretation of similar language, the Regional Board should realign Provision A to reflect the original policy goal of compliance through an adaptive management approach.

The purpose of this letter is to stress that the Regional Board has the discretion to make the policy decision to realign the language of Provision A to reflect the adaptive management approach. For the following key legal reasons, the Regional Board has this authority:

- It is settled law that the Clean Water Act does not require MS4 discharges to strictly comply with water quality standards. (Defenders of Wildlife v. Browner

(9th Circuit) 191 F.3d 1159.) In 1987, when Congress created the MS4 permitting system, it expressly treated MS4 discharges differently than all other MS4 discharges. As Courts have affirmed, Congress unambiguously decided that strict compliance with water quality standards was not required for MS4 discharges.

- The State Board has developed standard receiving water limitations language and has expressly interpreted that language as not requiring strict compliance with water quality standards. (State Board Order 2001-15.) To the contrary, the State Board has explained that "compliance is to be achieved over time, through an iterative approach requiring improved BMPs."

- Other MS4 permits issued by U.S. EPA directly or approved by U.S. EPA have employed the adaptive management approach as the basis for compliance with water quality standards. These permits have not required strict and immediate compliance with water quality standards for MS4 discharges.

Because the Clean Water Act does not demand that MS4 discharges strictly comply with water quality standards, and because the State Board has confirmed that compliance is to be achieved over time through the iterative process, the Regional Board should revise Provision A to realign the language with this policy approach. In light of the unique nature of MS4 discharges, as recognized by Congress, strict and immediate compliance with water quality standards is generally not feasible or appropriate.

Although the State Board has scheduled a November 20, 2012 workshop to discuss the receiving water limitations language, the Regional Board should provide policy direction on this issue now. It is requested that the Regional Board provide direction to staff to revise the language of Provision A to reflect the adaptive management approach as the basis for compliance. It is also requested that the Regional Board provide direction to staff to work with the State Board to support State Board language based on the adaptive management process. Addressing this issue now is particularly important for the Regional Permit because a failure to address the issue will undermine the value and acceptability of the watershed-based approach reflected in the Permit. The innovative approach taken in the Permit may be undermined entirely by the rigid language in Provision A. To support and allow dischargers to embrace the watershed-based approach, Provision A must be realigned with the adaptive management process.

We ask that this letter be provided to the full Board in advance of the workshop. It has been authored and signed below by our office and by counsel on behalf of the City of San Diego and City of Santee.

Very truly yours,

THOMAS E. MONTGOMERY, County Counsel

Re: TENTATIVE ORDER R9-2013-0001 REGIONAL NPDES PERMIT FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF WITHIN THE SAN DIEGO REGION

Dear Chairman Destache and Board Members:

On behalf of the City of Carlsbad (City), please accept the information contained in this letter as formal comment to Tentative Order R9-2013-0001 Regional NPDES permit for Municipal Separate Storm Sewer Systems (MS4s) draining the watersheds within the San Diego Region, in preparation for the Regional Board Member workshop on November 13, 2012.

The City would like to take this opportunity to thank the San Diego Regional Water Quality Control Board (RWQCB) personnel for their progressive approach to stakeholder involvement in drafting the Tentative Order in the past six months. Overall, the focused meetings have been successful and have resulted in an improved permit. However, there are a few areas that warrant further refinement to ensure the permit is implementable, effective at improving water quality where needed, and sustainable from a social, environmental, and economic perspective.

The San Diego Copermittees will be providing verbal comments during the workshop which are supported by the City.

The City is also a Responsible Party in the San Marcos Hydrologic Area (SMHA), and therefore subject to the Bacteria Beaches and Creeks TMDL regulations included in Attachment E of Tentative Order R9-2012-0001. The City of Encinitas, as the lead for the SMHA Responsible Parties has submitted a comment letter on behalf of the Responsible Parties, which is also supported by the City of Carlsbad. We look forward to your thorough review of both sets of comments.

City Hall
1200 Carlsbad Village Drive, Carlsbad, CA 92008-1949 T 760-434-2821 F 760-720-9461

We appreciate the opportunity to work with the Regional Board and stakeholders in the development of regulations to improve water quality in our region. If you have any questions or need further clarification, please do not hesitate to contact Elaine Lukey, Environmental Manager, at (760) 602-7582.

Sincerely,

John Coates

San Diego, CA 92123-4340

SUBJECT: TENTATIVE ORDER R9-2013-0001 REGIONAL NPDES PERMIT FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4S) DRAINING THE WATERSHEDS WITHIN THE SAN DIEGO REGION

Dear Chairman Destache and Board Members:

The City of Del Mar has been pleased with the progressive process used to engage the regional Copermittees and stakeholders in the MS4 Permit reissuance process. RWQCB staff deserves commendation for their efforts to accommodate the Copermittees' written and verbal comments received into the Tentative Order in a quick and timely manner. This effort demonstrates the shared commitment of the RWQCB staff and Copermittees to develop an implementable, cost effective Permit that leads to improvements in water quality conditions. In light of the upcoming Public Workshop on November 13th, 2012 for the NPDES MS4 permit reissuance, the City of Del Mar would like to take the opportunity to address some key issues regarding Tentative Order R9-2013-0001.

In addition to those identified above, the City would like to highlight some of the valued outcomes of the permit reissuance process thus far, namely the Water Quality Improvement Plans (WQIP) as watershed planning documents and the requirement of adaptive management. We also agree with the intended approach for points of compliance with the Permit, as stated by RWQCB staff at the June 27th, 2012 focused meeting with stakeholders. Staff indicated that compliance would be based on the submission of complete Water Quality Improvement Plans (WQIP) and also the implementation and assessment of those WQIPs. Assessment includes adaptation to improve programs and plans to meet the established WQIP goals and ultimately water quality standards.

However, there are areas within the Tentative Order that we feel continue to warrant further consideration. This letter identifies the three primary areas of utmost importance where the process thus far appears to have reached an impasse. For these three topics, the RWQCB staff states that they are either not willing or, contrary to our understanding, not allowed to make further changes. The specific areas include:

I. Receiving Water Limitations language in **Provision A** of the Tentative Order;

II. Expression of Total Maximum Daily Load compliance is **Attachment E** of the Tentative Order, and;

III. Applicability of hydromodificaiton management requirements in **Provision E** of the Tentative Order.

A technical memorandum is attached with details on these topics of concern.

Our recommendations on these three issues are as follows:

I. Provision A Language Should Be Revised

The City urges you to provide direction to your staff to take an active and lead role on this extremely important issue. The new paradigm shift (WQIPs and required adaptive management) in the Tentative Order should be supported by revised state and local policies that encourage complete participation in the WQIP and adaptive management approach. Receiving water limitations language is driven by state and local policy and with a new standard of permitting upon us, the policies should reflect this new paradigm.

II. TMDL Compliance Should Be Consistent

The City of Del Mar urges you to direct staff to correct this apparent conflict between the RWQCB adopted Bacteria TMDL and the compliance requirements of the Tentative Order, Attachment E, Section 6.

III. Hydromodification Management BMPs Should Be Applied To Mitigate Hydromodification Impacts

The City of Del Mar respectfully requests you as RWQCB Members to direct RWQCB staff to include within the permit, the exemptions that were included in the HMP that RWQCB Members approved by Resolution No. R9-2010-0066 in 2010.

In summary, the City of Del Mar respectfully requests that RWQCB Staff and Copermittees work cooperatively on these three issues to find consensus and resolution. We appreciate your attention to our concerns, and we trust that this letter will be entered into the record at the November 13, 2012 meeting.

Sincerely,

Carl Hilliard

Kathleen Garcia, Planning and Community Development Director

FROM: Mikhail Ogawa, Clean Water Manager

DATE: November 1, 2012

SUBJECT: San Diego Regional Water Quality Control Board Tentative Order R9-2013-0001

BACKGROUND

The San Diego Regional Water Quality Control Board (RWQCB) issues Municipal Separate Storm Sewer (MS4) permits to the Cities within San Diego County, the County of San Diego, the San Diego County Regional Airport Authority and San Diego Unified Port District (Copermittees). These permits are extensions of the federal Clean Water Act.

In April 2012, the RWQCB staff initiated an informal process by releasing an Administrative Draft of the forthcoming permit. The intent was to engage the Copermittees and stakeholders through focused meetings to allow the opportunity for a dialog to occur. The focused meeting process included five focused meetings, two public workshops, and a workshop sponsored by Orange County Copermittees focused on Hydromodification Management. The process has culminated in the release of a Tentative Order for public review on October 31, 2012. Public comments on the Tentative Order must be submitted by January 11, 2013. In addition, the RWQCB will hold a public workshop as a part of their regularly scheduled Board meeting on November 13th, 2012 to receive input from the public.

Two outcomes of the permit reissuance process thus far include Water Quality Improvement Plans (WQIP) as watershed planning documents and the requirement of adaptive management. The use of WQIPs as planning documents and allowing modifications to MS4 implementation programs, the Tentative Order offers a paradigm shift from previous prescriptive permits that may have led to unfocused programs not directed towards improvements in water quality.

In abridged terms, the WQIPs will be watershed planning documents intended to direct program implementation to focus on the highest of watershed specific water quality issues. The WQIP process requires Copermittees to establish interim and final goals where the objective is to bring MS4 discharges and waterbodies into compliance with water quality standards. The goals must be measureable so that progress towards them can be demonstrated. The WQIPs require schedules to be established for achievement of the interim and final goals. In some cases, these schedules may extend beyond the intended five-year life of the MS4 permit. Specific programmatic strategies are also prescribed to identify the means of achieving the established goals within the schedules. Lastly, the WQIPs also require adaptive management, so that Copermittees may learn from special studies and past efforts to use the most efficient and effective strategies and Best Management Practices to achieve water quality goals. The stated intent of the Permit is to have compliance based on the development, implementation and adaptation of the strategies in WQIPs to meet the established goals and ultimately water quality standards.

CONCERNS REGARDING TENTATIVE ORDER

Provision A – Prohibitions and Limitations

The present use of the limitations in Provision A of the Tentative Order presents a dichotomy between requiring adaptive management BMP programs (i.e., WQIPs) and including receiving water limitations that prohibit discharges from the MS4s causing or contributing to violations of water quality standards[1]. The dichotomy may discourage the City from supporting the WQIP process, including adaptive management, if there is enforcement exposure based on the prohibition of discharges from the MS4s causing or contributing to violations of water quality standards. The City could be in violation immediately and continuously regardless of the efforts put towards the WQIPs and therefore may be discouraged from funding and participating in the adaptive management process that could ultimately work towards achieving water quality standards.

Board staff has verbalized that they have the discretion as to whether or not to enforce the receiving water limitations provision and intend not enforce this provision as long as the Copermittees demonstrate adequate progress through WQIP implementation and adaptation of program strategies. Furthermore, Board staff stated they have been directed to take a passive role and allow the State process[2] to be completed prior to making changes to the San Diego Regional MS4 Permit.

Attachment E – Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2013-0001

The Bacteria TMDL[3] states that for watersheds where there are no longer any impairments listed on the 2008 303(d) List (for REC-1 water quality standards), the Phase I MS4s are not required to submit a load reduction plan and are not subject to any further action under the TMDL as long as monitoring continues to support compliance with REC-1 water quality standards. However, if the impairment returns for REC-1 water quality standards, the Responsible Parties will be required to submit a load reduction plan to the RWQCB.

The City of Del Mar and other Responsible Parties in the San Dieguito and Los Peñasquitos watersheds demonstrated to the RWQCB that the two watersheds are within this scenario where the Pacific Ocean Shoreline of the two watersheds are no longer listed as impaired for indicator bacteria under REC-1 water quality standards. The Responsible Copermittees received written confirmation (see attached two email) that they are "not subject to further action under Resolution No. R9-2010-0001 as long as monitoring data continues to support compliance with the REC-1 water quality standards." This scenario essentially places our two watersheds in a "dormant TMDL", unless the Pacific Ocean shoreline of the one or both of the watersheds are relisted on future 303(d) lists for indicator bacteria[4].

---

[1] Tentative Order R9-2013-0001 Provision A.2.a.

[2] State Water Resources Control Board is holding a Public Workshop on MS4 permits Receiving Water Limitations (RWL) Language on November 20, 2012. There is currently no schedule as to when and if the SWRCB will develop revised positions on RWL for MS4 permits.

[3] Revised TMDL for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek) adopted by SDRWQCB Resolution No. R9-2010-0001

[4] Page A66 of SDRWQCB Resolution No. R9-2010-0001

Attachment E, Section 6[5] of the Tentative Order requires, amongst other provisions, the compliance with Water Quality Based Effluent Limitations (WQBELs). The WQBELs as described in the Tentative Order are expressed as Receiving Water Limitations, Effluent Limitations and as Best Management Practices requirements. As written, the Responsible Copermittees in the two watersheds are required to meet the listed WQBELs even while under the "dormant TMDL" condition.

There is a conflict between relisting of the Pacific Ocean shoreline and the more strict WQBEL limitations. Relisting of the Pacific Ocean shoreline would be done under the criteria established in the 2004 SWRCB Listing Policy[6] which allows for a certain number of water quality standard exceedances prior to listing. The WQBEL limitations allow **zero** water quality standard exceedances under dry weather conditions – a much higher bar with which to comply. If the WQBELs are included in the final adopted Permit, at a minimum, the WQBEL compliance is only applicable when the TMDL is in an active phase – i.e., the waterbody is impaired and listed on the 303(d) list as specified in the Bacteria TMDL (SDRWQCB Resolution R9-2010-0001). Otherwise, the Copermittees will be required to focus intense resources to address bacteria at the Pacific Ocean shorelines where water quality monitoring has demonstrated that it is not an issue. This ironic paradox would be contradictory to the watershed based adaptive management process where the objective is to focus limited resources on the highest water quality issues.

Provision E.3.c.(2) Hydromodification Management BMP Requirements
The Tentative Order defines hydromodification as:

> The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, such as stream channelization, concrete lining, installation of dams and water impoundments, and excessive streambank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

The Tentative Order requires that priority development projects, including redevelopment projects, are required to control post-project runoff flow rates and durations so as not to result in increased potential for erosion, or degraded instream habitat conditions downstream of the projects. There are several explicit exemptions for these requirements identified in the Tentative Order. However, these exemptions are not inclusive of many of the exemptions identified in the San Diego Regional Copermittees Final Hydromodification Management Plan[7] (HMP). The exemptions identified in the HMP include, but are not limited to, projects that discharges to an exempt river reach, or a tidally-influenced area and other areas where there was little or no increased potential for erosion, or degraded instream habitat conditions downstream of the projects.

Over 95% of the City of Del Mar's MS4 system drains directly to either the Pacific Ocean or to tidally influenced areas of the San Dieguito estuary and river. The areas that drain to the Pacific

[5] Attachment E, Section 6 of the Tentative Order is the Specific Provisions for Total Maximum Daily Loads Applicable to Order R9-2013-0001 for the Revised TMDL for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)
[6] State Water Resources Control Board – Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List, adopted September 2004
[7] Approved on July 14, 2010 by San Diego RWQCB Resolution No. 2010-0066

Ocean will remain exempt per the Tentative Order, however, those areas that drain to tidally influenced areas of the San Dieguito estuary and river will not be exempt even though they have no Hydromodification impacts. The City will be forced to require priority development projects to mitigate for impacts they will not have.

City of
Encinitas

November 5, 2012

Honorable Grant Destache, Chair
Honorable Board Members
San Diego Regional Water Quality Control Board
9174 Sky Park Court, Suite 100
San Diego, California 92123-4340

SUBJECT: TENTATIVE ORDER R9-2013-0001 REGIONAL NPDES PERMIT FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF WITHIN THE SAN DIEGO REGION

Dear Chairman Destache and Board Members,

As it relates to the forthcoming Public Workshop on November 13th, 2012 please accept this letter on behalf of the City of Encinitas and the responsible parties of the San Marcos Hydrologic Area (HA) including the Cities of Carlsbad, Escondido, San Marcos, and the County of San Diego, as identified in Resolution No. R9-2010-0001 incorporating into the San Diego Basin Plan the *Revised Total Maximum Daily Loads (TMDL) for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (including Tecolote Creek)* (Bacteria TMDL).

At the November 13, 2012 Public Workshop, two significant and interrelated regulatory Orders will converge that individually deserve careful consideration, and even more so collectively. Tentative Order No. R9-2013-0001 includes *Attachment E – Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2013-0001*, and specific provisions for implementing the TMDLs adopted by the San Diego Water Board. Included in *Attachment E* are compliance requirements specific to the Bacteria TMDL[1], including the San Marcos HA.

The Bacteria TMDL states that for watersheds where there are no longer any impairments listed on the 2008 303(d) List (for REC-1 water quality standards), the Phase I MS4s are not required to submit a load reduction plan and are <u>not subject to any further action under the TMDL as long as monitoring continues to</u>

[1] Revised TMDL for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek) adopted by SDRWQCB Resolution No. R9-2010-0001

Tel 760/633-2600 FAX 760/633-2627, 505 South Vulcan Avenue, Encinitas, CA 92024 TDD 760/633-2700

support compliance with REC-1 water quality standards. However, if the impairment returns for REC-1 water quality standards, the Responsible Parties will be required to submit a load reduction plan to the RWQCB.

The City of Encinitas and the San Marcos HA Responsible Parties have demonstrated to the RWQCB that this hydrologic area is consistent with the scenario described in the Bacteria TMDL, as the Pacific Ocean Shoreline Segment at Moonlight Beach in Encinitas (in the San Marcos HA) is no longer listed as impaired for indicator bacteria under REC-1 water quality standards. The Responsible Parties received written confirmation (*See Attached E-Mail dated Wednesday, May 16, 2012)* that they are "*not subject to further action under Resolution No. R9-2010-0001 as long as monitoring data continues to support compliance with the REC-1 water quality standards.*" This scenario effectively places the San Marcos HA in a "dormant TMDL" status, unless the Pacific Ocean shoreline of the San Marcos HA is relisted on future 303(d) lists for indicator bacteria[2] and REC-1 impairment.

Attachment E, Section 6[3] of the Tentative Order requires, amongst other provisions, compliance with Water Quality Based Effluent Limitations (WQBELs). The WQBELs as described in the Tentative Order are expressed as Receiving Water Limitations, Effluent Limitations and as Best Management Practices requirements. As *Attachment E* of the Tentative Order is currently written, the Responsible Copermittees in the San Marcos HA are required to meet the listed WQBELs even while under the "dormant TMDL" condition.

Further exacerbating this conflict, there is a disparity between relisting of the Pacific Ocean shoreline and the more strict WQBEL limitations presented in the Tentative Order. If future conditions and monitoring data were to support a re-listing of the Pacific Ocean shoreline at Moonlight Beach, this would be done under the criteria established in the 2004 SWRCB Listing Policy[4] which allows for a certain number of water quality standard exceedances prior to listing. In clear contrast, the WQBEL limitations in the Tentative Order allow **zero** water quality standard exceedances under dry weather conditions – a much higher bar with which to comply than the listing criteria. In effect, San Marcos HA Responsible Parties will be required to focus intense resources to address bacteria at this Pacific Ocean shoreline segment where water quality monitoring has demonstrated an impairment does not exist.

[2] Page A66 of SDRWQCB Resolution No. R9-2010-0001
[3] Attachment E, Section 6 of the Tentative Order is the Specific Provisions for Total Maximum Daily Loads Applicable to Order R9-2013-0001 for the Revised TMDL for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)
[4] State Water Resources Control Board – Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List, adopted September 2004

In summary and in consideration of this involved and complex set of issues it is important to acknowledge the following facts:

- Per the 2010 303(d) list, the Pacific Ocean shoreline at Moonlight Beach (San Marcos HA) is NOT impaired for REC-1 Beneficial Uses (Moonlight Beach is the location that is the basis for including the San Marcos HA in the Bacteria TMDL).
- Per the 2010 303(d) list, the listing at Moonlight Beach for total coliform is based upon the water quality objectives for the SHELL beneficial use only, and as stated above, is not listed for REC-1.
- Per Resolution No. R9-2010-0001, the TMDL applies only to REC-1 and does not apply to SHELL impairments

  Pg. 4, footnote 17: "waterbodies with SHELL beneficial use impairments will be addressed in a separate TMDL project and/or standards action."

Based upon this background information and the conclusions presented above, at this time the Responsible Parties of the San Marcos HA would like to request your direction to RWQCB staff to address the conflict between the RWQCB adopted Bacteria TMDL and the compliance requirements of Tentative Order R9-2013-0001.

Sincerely,

Gus Vina,
City Manager, City of Encinitas

Subject: Your April 23, 2012 Letter Regarding Bacteria TMDLs and Moonlight State Beach

Dear Mr. Vina et al,
Thank you for your letter dated April 23, 2012 requesting written acknowledgment of your conclusions regarding the applicability of the Bacteria TMDLs to Moonlight State Beach and the requirement for submittal of a Bacteria (or Comprehensive) Load Reduction Plan (BLRP or CLRP).

The REC-1 TMDLs adopted under Resolution R9-2010-0001 remain in effect and applicable at Moonlight State Beach. However you are correct that the Responsible Parties (RPs) are not required to submit a BLRP or CLRP (specific to this beach segment) within 18 months of the effective date of the Bacti I TMDLs because this beach segment is not currently impaired/listed for REC-1. Furthermore, the Moonlight State Beach segment is not subject to further action under Resolution No. R9-2010-0001 as long as monitoring data continues to support compliance with the REC-1 water quality standards (Resolution No. R9-2010-0001 page A2). If, however, the segment is re-listed on a future 303(d) List for a REC-1 impairment, the RPs will be required to submit a BLRP or CLRP for this beach segment within 6 months of the adoption of the 303(d) List by the San Diego Regional Board (Resolution No. R9-2010-0001 page A66).

I trust this email adequately addresses your inquiry regarding TMDL applicability and BLRP or CLRP submittal. Regarding ongoing monitoring requirements, please refer to your MS4 permit for the general requirements and direct any specific monitoring questions to Mr. Wayne Chiu at wchiu@waterboards.ca.gov . Please feel free to contact me or Wayne at any time if additional clarification is needed.

Sincerely,

Deborah Jayne

THE CITY OF SAN DIEGO

December 4, 2012

VIA EMAIL to: rb9agenda@waterboards.ca.gov

Mr. Gary Strawn
Acting Chair
San Diego Regional Water Quality Control Board
9174 Sky Park Court, Suite 100
San Diego, CA 92123

Subject: Tentative Order No. R9-2013-0001, December 12, 2012 Regional Board Meeting Agenda Item No. 11

Dear Mr. Strawn:

Thank you for the opportunity to participate in the Regional Water Quality Control Board's (Regional Board) December 12, 2012 workshop regarding the Tentative Order No. R9-2013-0001 hereinafter referred to as the "Tentative Order." This letter is being submitted to communicate the City of San Diego's (City) concerns regarding the Tentative Order for discussion at the Regional Board's December 12th meeting. A summary of the key issues is provided below. In addition, the City participated with the Copermittees in the San Diego region to develop written responses to the questions raised by the Regional Board at the November 13, 2012 workshop. The City requests that the Regional Board direct staff to work with the Copermittees to address these remaining issues before considering approval of the Tentative Order.

- *Revise the Tentative Order to allow a Copermittee to achieve compliance with Receiving Water Limitations, Areas of Special Biological Significance (ASBS) and Total Maximum Daily Load (TMDL) requirements, if the Copermittee is implementing an approved Water Quality Improvement Plan.* The City is committed to protecting and improving water quality in the San Diego Region. To that end, it is the City's objective for the Tentative Order to allow for the City to efficiently integrate its TMDL, ASBS and Municipal Permit requirements into an adaptive management program that allows the City to achieve compliance through implementation and iterative improvement of programs designed to achieve water quality goals. The mechanics and structure of the Water Quality Improvement Plan developed by Regional Board staff provide an innovative, thoughtful, and strategic framework for such an approach. However, the Tentative Order still does not provide a pathway for the City to achieve compliance with ASBS and TMDL regulations and the

Tentative Order's receiving water limitations while implementing the Water Quality Improvement Plans. Without these linkages, there remains little incentive for the City to undertake the significant increases in investments that would be required to implement the Water Quality Improvement Plans.

- *Revise the Bacteria TMDL requirements to allow for load- and BMP-based compliance, per the adopted Bacteria I TMDL.* The Bacteria I TMDL Basin Plan Amendment included options for concentration and load-based methods of calculating Waste Load Allocations. In addition, the Basin Plan Amendment allowed for the possibility of BMP-based compliance with the Bacteria I TMDL provided certain criteria and assurances were acceptable to Regional Board staff. These options should be included in the Tentative Order.

- *Revise the Tentative Order to uphold the previously adopted San Diego Hydromodification Management Plan (San Diego HMP), Resolution No. R9-2010-0066.* This plan has been in effect for less than two years. The San Diego HMP was developed by an expert consultant team that utilized extensive scientific studies, analysis and modeling to determine the appropriate hydromodification control criteria. Additionally, the San Diego Copermittees have embarked upon a $1.5 million, 5 year monitoring plan to validate the parameters and design criteria. There have been no scientific advances in the last 2 years to justify revisions to the San Diego HMP, therefore we request allowing the Copermittees to continue implementation of the current San Diego HMP.

- *Replace the monitoring and assessment requirements in the Draft Permit (Provision D.4) with the strategic monitoring approach developed collectively by the Copermittees.* The Copermittees' approach will more efficiently and effectively address critical questions necessary to adaptively manage the City's programs and realize our storm water quality goals.

We appreciate this opportunity to share our comments and look forward to continued discussions in finding ways to improve and protect water quality. If you have any questions please contact Drew Kleis, Program Manager at (858) 541-4329.

Sincerely,

Kris McFadden

Monday, December 10, 2012

Mr. Rich Crompton, Director
County of San Diego Department of Public Works
5510 Overland Ave, Ste 410
San Diego, CA 92123

Dear Mr. Crompton,

Re: Comment – Tentative Order No.R9-2013-0001, Regional MS4 Permit,
Place ID: 786088Wchiu

At its December 4, 2012 meeting the Pala Pauma Community Sponsor Group ("PPCSG") voted unanimously to support the action of San Diego County to protect water quality while controlling the mounting and unsubstantiated costs of increased regulation on local governments, business and industry. In particular, PPCSG supports the view that regulation based upon unproven science used in pursuit of parametric objectives that are apparently unattainable is poor governance and detrimamential to the interests of our community.

PPCSG believes that it is incumbent upon regulatory agencies to ensure that their enacted regulations are practical, cost-effective, and scientifically based. We are concerned that, otherwise, public funds may have to be spent to comply with requirements that are not proven nor effective, and that this will ultimately reduce the funding available for community projects and essential public services and increase the costs absorbed by trade and industry thereby inhibiting badly needed economic growth.

It appears that, as written, the Tentative Order will result in a significant and unprecedented level of regulation and cost without clear scientific basis or environmental benefit. The three main areas of concern in the draft permit are: i.) a far-reaching Bacteria Total Maximum Daily Load ("BTMDL"), ii.) additional requirements for development projects, and iii.) performance standards that unnecessarily expose municipalities to third-party lawsuits

PPCSG understands that the cost to comply with the Bacteria TMDL is estimated to be between \$2.6 billion and \$4.9 billion for the named watersheds in the region over the 20 year TMDL compliance timeline, of which only 18 years remain. The numeric targets in this TMDL may never be attainable even if government agencies were to spend billions in public resources, thereby increasing the costs of business and trade. PPCSG understand that available technology does not exist to return urbanized watersheds back to pristine, "reference" conditions.

Additionally, the Tentative Order requires that new and re-development projects return site hydrology to pre-development conditions as opposed to pre-project conditions. Returning urban infill projects to conditions that existed under "natural", pre-urban conditions would be a substantial constraint to re-development to the disadvantage of general Plans that seek to use infill development as a way of reducing urban sprawl. Further, the Tentative Order ignores all of the good work invested in the Hydromodification Management Plan developed at a significant cost to the public over the past years between the County and Regional Board staff and apparently seeks to impose a new, one-size-fits-all requirements standard that is unrealistic and without scientific justification. The result of all these changes is that the structures built to mitigate development impacts will need to be bigger and will cost significantly more than under the currently approved program.

PPCSG understands that receiving water limitations language is contrary to the intent of the Federal Clean Water Act, which is to assure municipal agencies will be regulated to a reasonable standard resulting in State and Regional Water Boards having the responsibility to ensure that water quality regulations are applied in a context that results in <u>economic and environmental sustainability</u>. PPCSG further understands that the 21 Co-permittees in our region (the County, 18 cities, Port District, and Airport Authority) already spend close to $120 million a year to comply with current regulations. PPCSG would like to see the Regional Board adopt Permit standards that will be cost neutral in a way that local municipalities will have the flexibility to apply funding to priority areas.

PPCSG is hopeful that the final permit language will result in programs that are rational from both environmental and economic standpoints -regulation within reason- and not impose upon our community the crippling disadvantages of regulation without reason.

Yours sincerely,

Charles Mathews

Charles Mathews, Chair,

RE: Supplemental Comments for Aliso Watershed in South Orange County
San Diego Regional Municipal Separate Storm Sewer System (MS4) Permit,
Tentative Order No. R9-2012-0011

The South Laguna Civic Association, established in 1946, supports comments and recommendations submitted September 14, 2012 by the "Environmental Groups" regarding the administrative draft of the San Diego Regional Municipal Separate Storm Sewer System (MS4) Permit, Tentative Order No. R9-2012-0011 ("Administrative Draft Permit").

While a regional permit can provide improved levels of efficiency, smaller, high value habitats and coastal receiving waters established as critical marine life recovery areas may be overlooked. The Aliso Watershed in south Orange County represents an area requiring closer consideration.

Aliso Creek discharges 1 to 5 million gallons per day of dry weather urban runoff from known inland MS4 point sources. Twenty years of monitoring reports and over $20 million have clearly identified at least one dozen offending storm drains with daily dry weather flows exceeding 150,000 gallons per day (GPD). Only one storm drain in Laguna Niguel has received a Clean-up and Abatement Order during this period.

As recently as 1982, surveys of Aliso Creek indicated no flows throughout the dry season. In fact, early ranching of Aliso Canyon with subsequent destruction of critical native trees and vegetation led to long drought conditions and widespread, fatal dehydration of cattle.

Today, the primary source of elevated creek flows originates exclusively from inland over-irrigation and careless discharges of recycled water. Non-native creek flows transport a toxic variety of pollutants and carcinogens from residential, commercial and municipal known point sources with measurable quantities of herbicide, pesticide, fertilizer, automotive and similar residues to protected creek, estuary and coastal receiving waters. Aliso Beach is permanently posted for contaminated water and remains a risk to public health and safety.
(Please see Exhibit A – 2011 Aliso Creek Daily Flow/e.g., August 1, 2011 @ 7.6cfs = 4.9 MGD)

<u>Economics of Water Pollution</u>

Water Districts profit significantly from the sales of recycled water yet fail to be held accountable by the SDRWQCB for illicit discharges generated specifically by careless over-irrigation. Over-irrigation produces hundreds of thousands of dollars in excess revenues each year to inland Water Districts that persistently ignore the impact of their product water. Profiting from water pollution discharges to protected receiving waters is illegal as adjudicated by Friends of the Earth v Laidlaw (2000) and other statutes and regulations.

"District Court found that Laidlaw had gained a total economic benefit of $1,092,581 as a result of its extended period of noncompliance with the permit's mercury discharge limit; nevertheless, the court concluded that a civil penalty of $405,800 was appropriate. In particular, the District Court found that the judgment's "total deterrent effect" would be adequate to forestall future violations…" (Friends of Earth, Inc. v. Laidlaw Environmental Services (TOC), Inc. - 528 U.S. 167 (1999)

In the Aliso Watershed, recycled water sold for irrigation and over watering produces an average creek discharge flow of 3 MGD during the nine month dry season. Sold at $1000 per Acre Foot (AF), this irrigation product water yields revenues to inland Water Districts of over $10 million during the five year MS4 Permit cycle. (calculation: 3 MGD = 9 AF x $1000/AF x 300 days = $ 2.7/year x 5 year permit cycle = $10 mil+).

Lacking effective enforcement measures by the SDRWQCB, these excessive and illegal profits encourage increased sales of irrigation water without any accountability for the obvious impacts of water products to protected creek and coastal receiving waters. The Irvine Ranch Water District, El Toro Water District, Santa Margarita Water District and Moulton Niguel Water District must not be allowed to profit from water pollution.

Persistent violations of MS4 requirements are acknowledged by all parties yet the SDRWQCB refuses to invoke effective enforcement measures and fines. Without economic disincentives, offending Water Districts gain illegal profits while inland cities accumulate tax property revenues from poorly engineered development projects. Citations against the more egregious offending storm drain dischargers can release funds for effective mitigation measures and support incentives for regional MS4 compliance.

Environmentally Sensitive Areas (ESA)

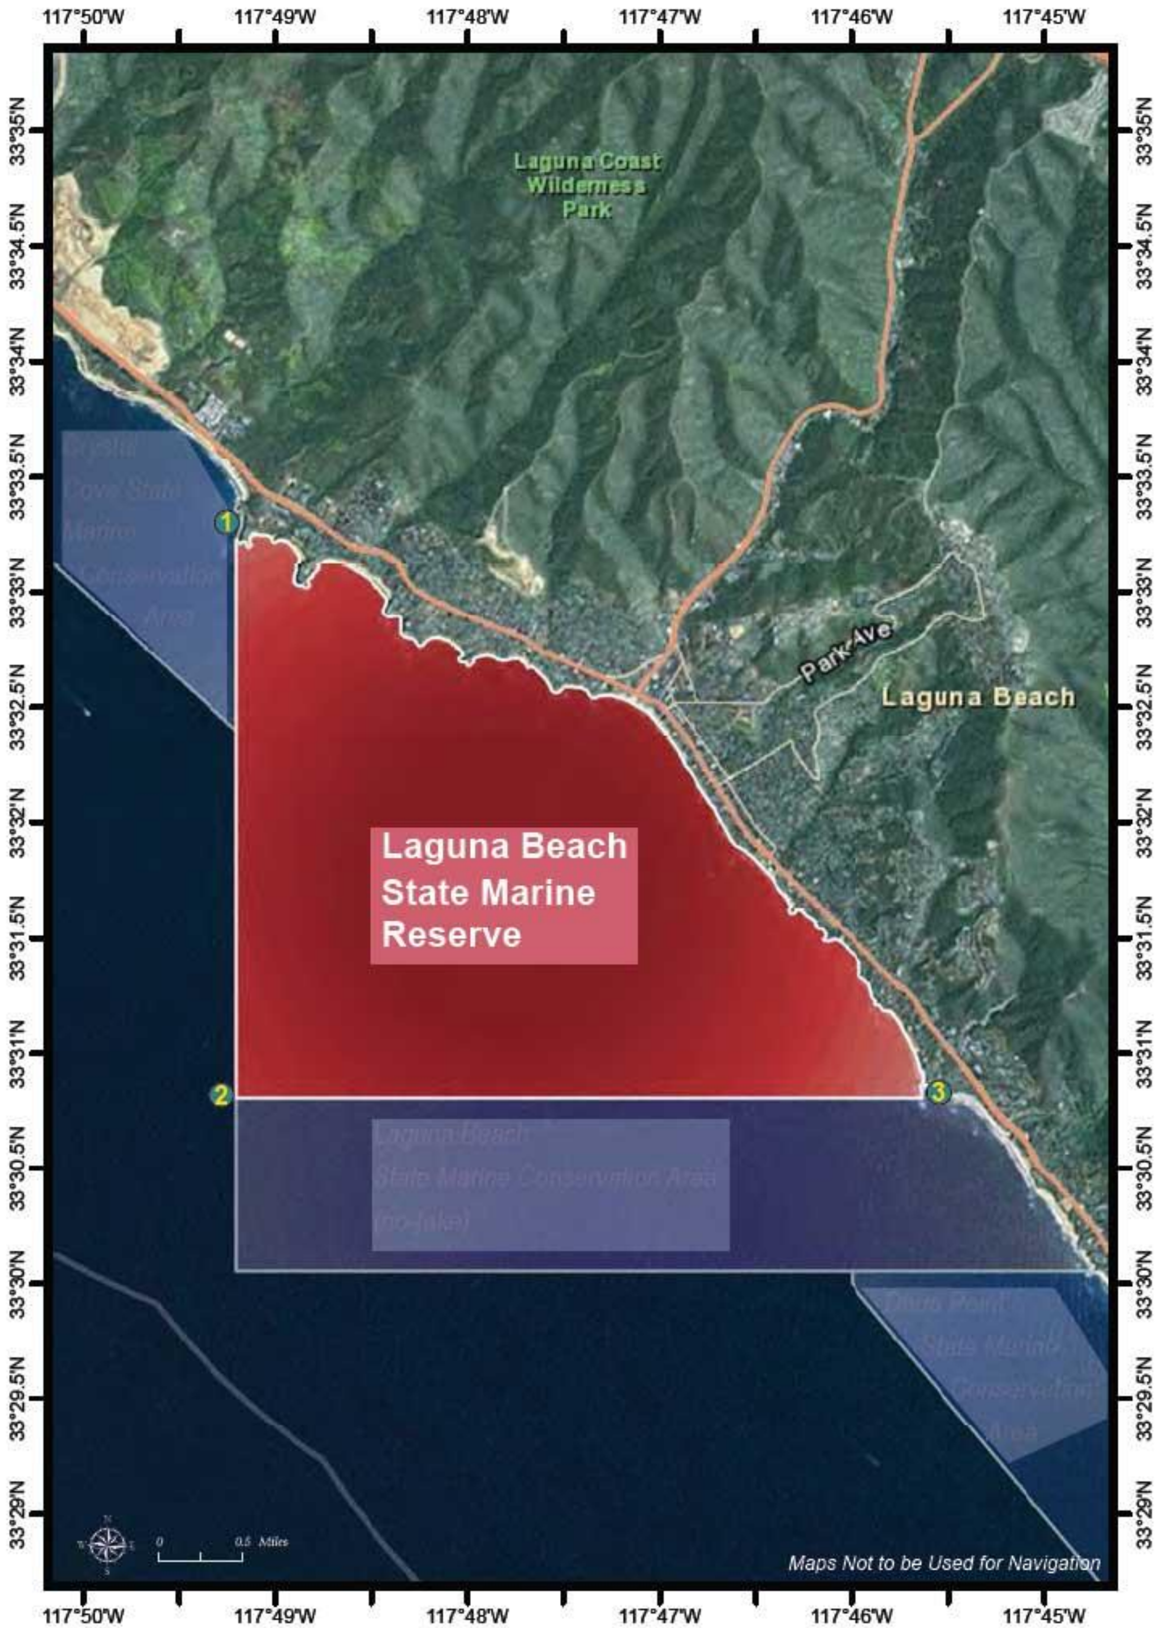
The Aliso Watershed is a compact 34 square mile area suffering decades of neglect and pollution originating from poorly engineered residential developments among inland cities. Plans to add 17,000 new houses to South Orange County in the coming years will exacerbate the water pollution crisis facing Laguna Beach. Runoff management plans fail to control dry weather urban runoff and knowingly contribute directly to increased flows and erosion during routine storm events.

The Aliso Creek Wilderness Park remains degraded from erosion impacts to streambed habitat and threatens to expose critical sewage infrastructure transporting 10 to 15 million gallons of secondary sewage to the Aliso Creek Ocean Outfall only 1.2 miles offshore. A recent study by TetraTech for the South Orange County Wastewater Authority (SOCWA) determined the integrity of creek infrastructure to be capable of failure in as little as 5 years. Coastal receiving waters at the mouth of Aliso Creek are impaired by polluted urban runoff flowing at 1 to 5 million gallons per day (GPD). Aliso Creek is listed as a 303(d) Impaired Water Body by the Clean Water Act and continues to fail to meet present and previous MS4 Permit requirements. (Exhibit B – Aliso Creek Watershed 303(d) Impaired Waterbodies)

All Co-Permitees, as signatories to the MS4 Permit, are legally responsible for water quality in terms of coastal receiving waters. The regulatory and legal nexus is clear between unpermitted discharges by inland Co-Permitees, creek erosion and infrastructure damage, ocean pollution and public health hazards associated with these contaminated daily flows.

Aliso Beach, at the mouth of the federally listed contaminated creek, is permanently posted. However, coastal receiving waters are protected as the Laguna Beach State Marine Conservation Area established unanimously by the California Fish & Game Commission on January 1, 2012.

Laguna Beach State Marine Reserve



The proposed MS4 Permit does not adequately address efficacious measures to protect creek and coastal receiving waters while allowing contaminated discharges to persist without adequate enforcement actions. Lacking meaningful enforcement actions, inland cities as Co-Permitees, persist in ignoring or circumventing water quality regulations with impunity while creek and coastal receiving waters and ESA habitats continue to be incrementally degraded by polluted dry weather flows. Damage to coastal habitats is cumulative and potentially expensive in terms of restoration.

Likewise, failed Best Management Practices (BMP) stormwater facilities required as a Condition of Approval for inland residential, industrial and municipal developments are inadequately engineered devices incapable of mitigating elevated flows from stormwater events directed to creek and coastal receiving waters. The cumulative impacts of contaminated dry weather discharges and elevated stormwater flows have destroyed the functions of the Aliso Estuary (a protected coastal wetland), tidepools, fish nurseries and local kelp forests.

Shellfish areas in California receive the highest water quality protection standards. The economic value of shellfish to the economy is well established and place names such as Abalone Point, Mussel Cove, Shellfish Beach, etc. along Laguna Beach's coastal receiving waters suggests the prominence of shellfish habitat in the local area. Routine underwater surveys of mussel grounds near the mouth of Aliso Creek reveal large areas of dead shellfish likely exposed to the urban runoff plume. Dry weather discharges and elevated stormwater flows to Laguna Beach's coastal receiving waters are incompatible with protection of ESA Shellfish habitat and should be vigorously regulated and prohibited in the proposed MS4 Permit.

Laguna's coastal receiving waters are prime foraging grounds for protected marine life including coastal dolphins, gray whales and blue whales.

Safari/Marc Carpenter, via Associated Press

A blue whale surfacing at 1000 Steps, South Laguna

The California Coastal Act is specific in protecting the health and welfare of marine mammals among other species. Therefore, the proposed MS4 Permit must address water quality inconsistencies among regulating agencies.

1. California Coastal Act, Article 4, Section 30230. Recent summer sightings of federally protected Blue Fin Whales feeding at the location of the Aliso Ocean Outfall suggest the need for compliance with the Coastal Act. The unseasonal presence of marine mammals feeding on krill indicates the presence of phytoplankton populations sustained by nutrient rich urban runoff and offshore sewage discharge plumes migrating to surface waters. New research also highlights the presence of hormonal endocrine disruptors in recycled water and sewage discharges as a contributing factor in the feminization of male fish.

2. California Coastal Act, Article 4, Section 30231. The SDRWQCB overlooks requirements for "the biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface water flow, encouraging waste water reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams."

3. Water Reuse Law, Water Code Sections 461-465 and Water Reclamation Law, Water Code Sections 13500-13556 requiring beneficial reuse of inland water product to implement recycled water throughout Laguna Beach in achieving a State mandated 20% reduction in imported water by 2020.

The recent Army Corp of Engineers Study Area Map recognizes the relationship of MS4 regulated areas by incorporating the coastal receiving waters for lower Aliso Creek project considerations. No similar map or chart is available to track and monitor regulated coastal receiving waters subjected to the contaminated urban runoff "freshwater lens".

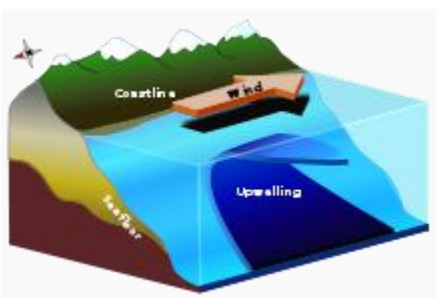
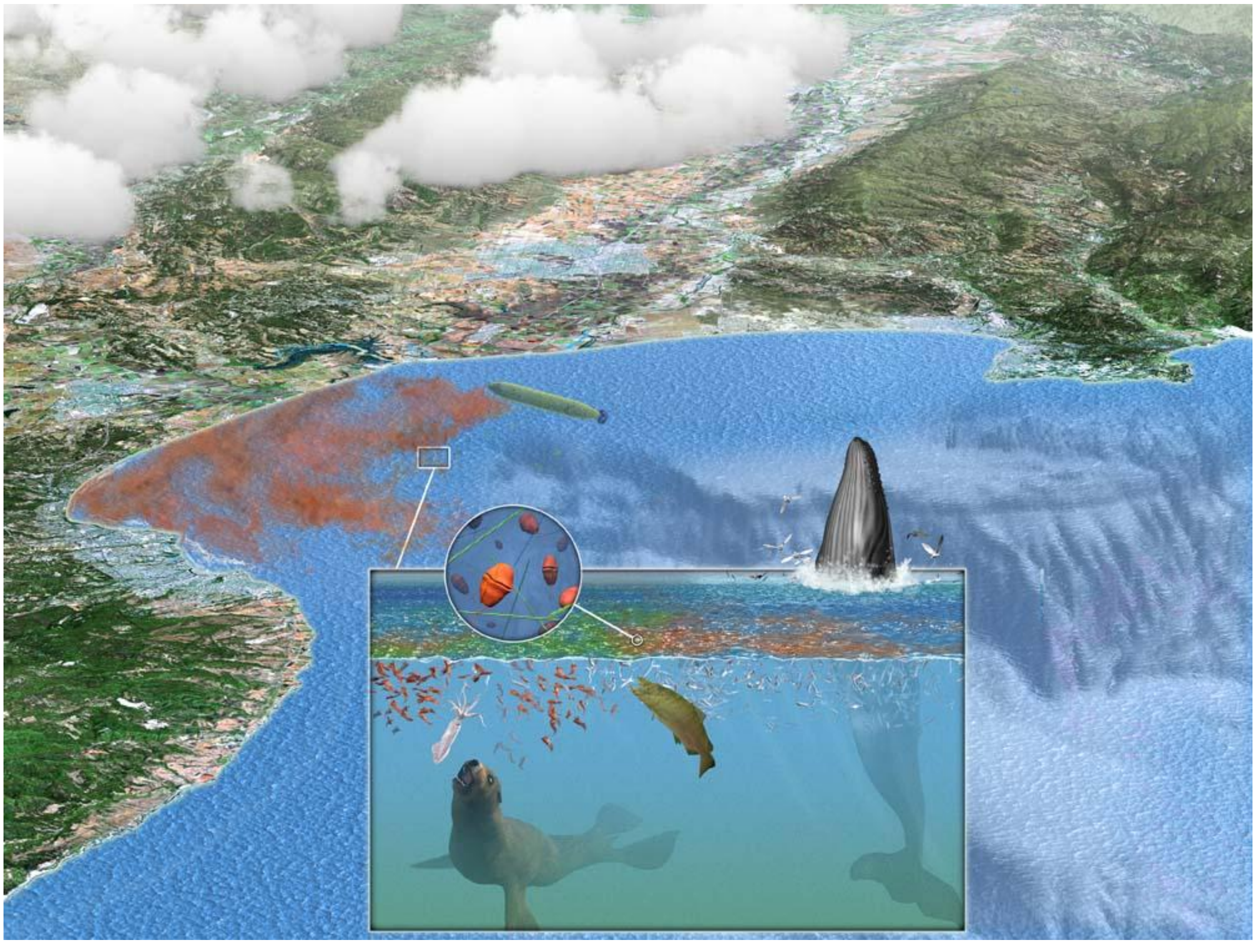
Urban Runoff, Secondary Sewage Discharges & Ocean Upwelling

Coastal receiving waters at the mouth of Aliso Creek are protected as the Laguna State Marine Conservation Area (SMCA). These important tidepool, rocky shore and kelp forest habitats, however, are subjected to multiple water pollution impacts from the combined urban creek urban runoff plume and Aliso Creek Ocean Outfall.

Ocean upwelling transports contaminates from the offshore sewage discharges to shore and mix with the visible creek urban runoff freshwater plume. Harmful algae blooms fed by these “nutrient rich” discharges plague coastal receiving waters and contribute to the destruction of kelp forests and shoreline fish nurseries. Beach visitors, often from regional low-income disadvantaged communities, suffer exposure to severe public health threats.



Multiple requests to South Coast Wastewater Authority for a comprehensive interactive map of the Aliso Creek coastal discharge plume and the Aliso Creek Ocean Outfall Plume are routinely ignored. An accurate map will identify protected coastal receiving water resources including tidepools, rocky fish nurseries and shellfish habitats, kelp forests, dolphin birthing and foraging grounds, as well as near shore whale migration routes. Charting dominant littoral currents and counter currents will reveal distribution patterns of urban runoff induced Harmful Algae Blooms and thermal plumes. Lacking such basic information, assurances of safe ocean water quality are presented without a fundamental scientific understanding of coastal dynamics.



Dry weather urban runoff plumes to Laguna's coastal receiving waters feed summer-long Harmful Algae Blooms (HABs) contributing to domoic acid poisoning of sea lions, whales, shellfish and fishing resources.

<u>Hydromodification</u>

The rapid regional development of residential tracts over the past few decades has been accomplished using grading techniques to create long, flat terraced building sites. In an effort to simplify construction on flat sites, natural contours are replaced with cut and fill earthworks removing natural top soils before paving over hydric substrates and native deep root vegetation. These practices expose expansive clay soils.

Developers avoid expensive deep caissons to bedrock or multiple dewatering wells and simply pour concrete pads over unstable clay substrate. City leaders seeking increased tax revenues and development fees utilize engineers unfamiliar with local clay soils and the semi-arid ecology to approve massive grading plans that ultimately fail.

Unsuspecting homeowners subsequently experience extensive expansion and contraction of clay subsoils following annual storm events. As foundations fail, water supply lines, sewage lines and related infrastructure become compromised requiring expensive repairs. By this time, however, developers have either moved or filed for bankruptcy protection leaving thousands of present homeowners without remediation opportunities. Engineers, city planners and elected officials, while complicit, are not held accountable through enforcement by the SDRWQCB. Poorly engineered residential developments with substandard clay soils continue to be approved to aggravate the condition and burden taxpayers for expensive repairs.

The Aliso Watershed is a clear example of faulty hydromodification design. Beginning with the construction of the federal Chet Holfield Ziggerat Complex, large areas of the native creek with valuable hydric soils were paved over for massive parking lots. The channelized creek lost critical inland wetlands and groundwater percolation sites with the removal of over 1500 feet of the creek ox bow. This wetland site historically provided water, fish and double canopy vegetative cover for the early "Nigueli"... the name of a Juaneno Native American village once located near a lagoon along Aliso Creek. The City of Laguna Niguel derives its name from the Spanish designation of this critical creek ox bow area.

Systematic destruction of vast native watershed trees and vegetation to support early ranching activities continue to plague the effectiveness of this and many watersheds in the San Diego region. Developers and complacent city planners exploiting degraded ranchlands simply continue the “biodegradation” while avoiding the true costs to the environment and taxpayers for their profiteering urbanization schemes. Facing unrelenting pressure from developers, water districts and municipalities, regulatory agencies charged with protecting critical creek and coastal receiving waters, fail to invoke effective enforcement with measurable water quality benefits.

<u>Recommended Actions</u>

Poorly engineered projects can be re-engineered to achieve mandated water quality objectives.

1. Maps of all creek and coastal receiving waters indicating water quality impacts can be created by SCCWRP, Scripps, NOAA or any number of competent university or regulatory groups. A Bioregional Watershed Map will identify degraded land elements, offending storm drain outlets and candidate areas for re-forestation and estuarine/coastal restoration.

2. On an annual basis, citations against the primary six known storm drain point sources in each watershed can incrementally compel clean-up and abatement throughout a given watershed bioregion without the burden of costs to abate all points of contamination at once. Failed Best Management Practices (BMPs) urban runoff facilities, required as a Condition of Approval for inland residential developments, can be retrofitted with dry weather diversions to local Publically Owned Treatment Works (POTWs) or, alternatively, re-engineered with deep groundwater injection wells.

3. Fines must be allocated to re-vegetate impaired watersheds and kelp forests to restore the native functions of semi-arid creeks and protected coastal receiving waters. A re-forested Aliso Canyon with a canopy similar to San Mateo Creek will qualify for California Cap and Trade

funding to offset costs. Restoration of natural habitats is demonstrated to be the best, most cost effective measure for improving watershed water quality.

4. Restoration of high value coastal wetlands and estuaries will guarantee protection of natural beach sand berms and provide measurable improvement to coastal receiving waters. Funds from the California Coastal Conservancy and other wetland recovery resources can offset costs.

5. Watershed restoration will offer multiple community benefits by reducing destructive stormwater flows, eliminating pollutants and increasing eco-tourist revenues to surrounding cities. Large street cisterns incorporating designs proposed by GeoSynTech for the re-development of the Aliso Golf Course can serve as a model for extensive rainwater harvest/reuse systems. Restoration of some or all of the 1500 foot Aliso Creek Ox Bow in Laguna Niguel can restore hydric soils to reduce stormwater impacts.

6. Increased use of recycled water for wildland fire suppression along the entire Highway 73 Toll Road bisecting the Laguna Greenbelt will maintain a healthy, fire safe wilderness area. Orange County Measure M and State Proposition funds are available to offset costs. Increased use of recycled water reduces ocean discharges to the Laguna State Marine Conservation Area.

7. A citywide network of recycled water for all of Laguna Beach will reduce imported water demand significantly and increase water security, disaster preparedness and fire suppression resources. Revenues from routine use for irrigation mandated Fuel Modification Zones will provide new revenue streams. Laguna Beach is the only Orange County city without a comprehensive recycled water program and remains a "once use" community of valuable imported water.

The MS4 Permit Renewal process offers the opportunity to advance beyond failed measures and begin the renewal of the region's unique watershed and coastal ecology. All Stakeholders can benefit through proactive initiatives and, as the overall watershed ecology improves, the cost savings from stormwater damage, water pollution, protracted litigation and public health threats will become evident. The South Laguna Civic Association has offered constructive, critical information and suggestions during the previous MS4 Permit cycle which have been largely ignored to the public's detriment.
(Exhibit C – SLCA Comments on Tentative Order No. R9-2007-0002 NPDES, No. CAS0108740)

Cooperation and courage are essential and the South Laguna Civic Association remains committed to working towards real, measurable, sustainable solutions. On behalf of our community and the many visitors from throughout the world to our shores, we thank you for your review and support of our recommended actions.

Michael Beanan

Vice President
South Laguna Civic Association

Exhibit C - SLCA Comments to 2007 MS4 Permit

Jeremy Haas April 11, 2007
California Regional Water Quality Control Board
San Diego Region 9
9174 Sky Park Court, Suite 100
San Diego, CA 92123
RE: Tentative Order No. R9-2007-0002 NPDES, No. CAS0108740

The members of the community of South Laguna represented by the South Laguna Civic Association, established in 1946, recognizes urban runoff from dry weather flows continues to be discharged through regional storm drain systems permitted exclusively to convey rain water.

The proposed SDRWQCB Tentative Order No. R9-2007-0002 knowingly, willfully and intentionally perpetuates a threat to health and safety while contributing to degradation of local creek and coastal water resources by allowing MS4 storm drain systems to transport polluted water originating from the imported water supply industry.

Dry weather flow rates in the subject watershed presently exceed all previous flow rates and are recognized as the principle source of nutrient loading and ocean pollution. Chemical fingerprinting analysis of urban runoff by the Santa Margarita Water District attributes the source of 60% to 90% of urban runoff dry weather flows as originating from imported water sources in either Northern California or Colorado. Dry weather flows to storm drains are from anthropogenic influences rather than natural storm events.

Seminal research by the University of Southern California and others concludes urban runoff is responsible for feeding prolonged, destructive algae blooms along the Southern California Bight. In conveying inland sources of fertilizer and phosphates nutrients, dry weather urban runoff estimated at 5,000,000 gallons per day in the Aliso Watershed alone is causing increased outbreaks of domoic acid poisoning and deaths among sea mammals in Laguna Beach. The SDRWQCB fails to take into consideration impacts of uncontrolled dry season urban runoff on the health and welfare of coastal receiving waters. In spite of repeated requests, the SDRWQCB and Co-Permitees to not incorporate the urban runoff ocean plume into the watershed mapping procedure rendering decision making ineffective and monitoring activities scientifically incomplete.

As indicated in Staff Reports, the SDRWQCB, South Orange County Wastewater Authority (SOCWA), inland cities and County Co-Permitees continue to fail to Cleanup and Abate contaminated dry weather urban runoff flows and thereby violate key statues of the Porter-Cologne Act and Clean Water Act.
In allowing the County and City Co-Permitees to continue to discharge polluted urban runoff water flows, the members of the SLCA and the general public are denied access to safe, unpolluted coastal recreational opportunities while exposing them to known respiratory and digestive illnesses. The incremental and cumulative discharge from Aliso Watershed storm drains also knowingly and willfully contributes to potential health risks from consuming local fish.

Likewise, potential private property values are threatened by disclosures during real estate transactions of public health hazards emanating from polluted coastal waters.

Residences at the mouth of Aliso Creek are permanently damaged by summer urban runoff from erosion and stagnant ponds. Damage from urban runoff pollution to critical kelp habitats and marine mammals characteristic of South Laguna Marine Reserve off of Aliso Beach are well documented in the scientific literature.

The Aliso Watershed has more than 64 storm drains with elevated fecal coliform levels and excessive flow rates. The inability of the SDRWQCB over the past 20 years to control illegal dry weather discharges suggests a pattern of failed interventions portending a dangerous precedent of chronic future water pollution to the community of South Laguna with a population of 5,000 residents and the general beach visiting public.

The South Laguna Civic Association (SLCA) seeks a thorough review of the laws, regulations and facts pertaining to mismanagement of the subject MS4 Storm Drain Permit. Verifiable action capable of significant reductions in dry weather flow rates must be implemented. Numerical flow rate reduction, specific performance benchmark deadlines and significant penalties for non-compliance must be incorporated into any credible permitting process. Interception of urban runoff flows at known inland point sources is technologically feasible through deployment of approved Best Available Control Technologies presently used by the development, military and oil industries. If necessary, a watershed Cleanup and Abatement Order can accelerate permitting and fast track measures until such time full compliance is achieved.

Failure to mitigate or comply requires the SDRWQCB to be directed to California Water Code Section 13304(a) and following to seek an injunction against the County and offending cities or perform the work itself. Concurrent with the present evaluation of Tentative Order No. R9-2007-0002, the SLCA seeks emergency action due to significant, immediate and potential harm from known health risks associated with dry weather urban runoff conveying elevated levels of fecal coliform and other contaminates to South Laguna since:

1. Substantial harm to the community of South Laguna will continue to occur this summer from exposure to dry-weather flows of contaminated urban runoff in the subject watershed. The approval of a systematically flawed MS4 Storm Drain Program will establish a dangerous precedent in the Aliso Creek Watershed and other impaired watersheds in the State of California to the detriment of South Laguna’s public health and safety as well as the protection of natural resources.

2. Neither the inland cities, County, SDRWQCB, SOCWA nor public will incur substantial harm from issuance of a comprehensive dry weather storm drain management program. The South Laguna Civic Association, in fact, will benefit from incremental reduction of contaminated flows from inland storm drains into creek and coastal receiving waters. Establishing a pattern of enforcement and full compliance with cleanup and abatement laws will initiate additional timely actions by the SDRWQCB to improve water quality in the Aliso Watershed and elsewhere. Costs associated with a comprehensive program to control dry weather flows can be minimized by fines, deployment of cost saving water conservation measures and revenues generated from beneficial reuse opportunities of 5 million gallons of urban runoff per day in the Aliso Watershed.

3. As indicated in this and other communications, substantial questions of fact and law are associated with the proposed Tentative Order No. R9-2007- 0002. The fact remains that immediate compliance and cessation of dry weather urban runoff is technologically and economically feasible as demonstrated by earlier diversions to the Moulton Niguel Water District's sewer treatment facility and, later, short term operation of mobilized urban runoff filtration units.

The narrative below cites a number of laws pertaining to enforcement of Cleanup and Abatement Orders (California Water Code Section 13304); the SWRCB Water Quality Enforcement Policy (February 19, 2002; pages 3,4,11,26, 39,42); regulations and policies governing Environmental Justice (Government Code Section 65040.12 and Public Resources Code Section 72000).

The County and City Co-Permitees concede their failure to Cleanup and Abate elevated levels of fecal coliform and increased urban runoff flow rates in the Aliso Watershed. The SDRWQCB does not comply with California Water Code Section 13304. Indeed, during the past 20 years, the Regional Board has failed to effectively intervene.

California Water Code Section 213300-13308, Chapter 5, provides the SDRWQCB Enforcement authority to issue a Cleanup and Abatement Order to remedy dry weather urban runoff.

Section 13304(a) "Upon failure of any person to comply with a cleanup and abatement order, the attorney general, at the request of the board, shall petition the Superior Court of the County for an issuance of an injunction requiring the person to comply with the order."

The SDRWQCB unwillingness to enforce compliance also violates Section 13304 (1)(b);(2)(a), (c), (e) to expend available money themselves to perform cleanup, abatement or remedial work; to intervene to perform the work itself; recover costs for cleanup and abatement work; and protect or prevent threatened probability of harm to persons, property or natural resources.

It is again worth noting, temporary compliance was achieved in 2003 utilizing mobilized water filtration units recognized among Best Management Practices (BMP). During its brief period of operation, the above BMP treated over 14 million gallons at JO3PO2 to reduce fecal coliform from 10,000 cfu's to less than 1. The SDRWQCB, SOCWA, Moulton Niguel Water District, City of Laguna Niguel and County dischargers arbitrarily elected to terminate this effective technology to experiment with low cost constructed wetlands, which ultimately failed to reach compliance levels for fecal coliform at the JO3PO2 outlet and took no effort to remove flows originating from abandoned imported water sources.

The SWRCB Water Quality Enforcement Policy (February 19, 2002; pages 3,4,11,26, 39,42) specifically directs the Regional Board to take action against the following:

- Any knowing, willful, or intentional violation of the (Porter Cologne Act)
- Any violation of (the Porter Cologne Act) that enables the violator to benefit economically from noncompliance, either by realizing reduced costs or by gaining a competitive edge advantage.
- Any violation that is a chronic violation or that is committed by a recalcitrant violator.
- Any violation that cannot be corrected in 30 days.

The SDRWQCB has taken no action pursuant to the above policies while proceeding to accommodate City and County Co-Permitees, Water Districts, SOCWA and developers at the expense of and detriment to the members of the SLCA and the general public.

Section 13350(m) of the Porter-Cologne Clean Water Act defines nuisance as anything which meets all of the following requirements:

1. Is injurious to health, or is indecent of offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life and property.

2. Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal.

3. Occurs during, or as a result of, the treatment or disposal of wastes.

Dry weather urban runoff meets and exceeds the legal definition of "nuisance" by virtue of it's widespread impacts to water quality variables. "Waste" refers to "waste water" knowingly and willfully generated by imported and reclaimed water sold at reduced rates that ignore significant post-irrigation dry weather urban runoff impacts.

Members of the South Laguna Civic Association are at particular risk of injurious health from frequent exposure to pollution in Aliso Creek and recreational coastal water activities. Such threats and illnesses create an obstruction to the free use of public property at local County parks, protect State Marine Reserves and beaches to thereby interfere with the comfortable enjoyment of life and property.
The extent of annoyance and damage is unequal with increasing harm to individuals such as swimmers, surfers, SCUBA divers, etc. with more frequent contact to polluted creek and ocean waters according to recent studies by the University of California, Irvine. Young children playing long hours at the beach and pregnant women are particularly high-risk populations.

The casual relationship occurring with the discharge of contaminated urban runoff wastewater with elevated fecal coliform levels is well established in scientific and medical literature as to impose a viable threat to the community of South Laguna. Government Code Section 65040.12 and Public Resources Code Section 72000 states:

"…the fair treatment of people of all races, cultures and income with respect to the development, adoption, implementation and enforcement of environmental laws, regulations and policies"

The proposed Tentative Order No. R9-2007-0002 is discriminatory and violates the State of California's definition of Environmental Justice.

As previously noted, the community of South Laguna and visitors to the Aliso Creek Watershed and Aliso Creek County Beach have entreated the SDRWQCB for decades for relief from polluted urban runoff flows resulting from the non-regulation or enforcement of the County/City's chronic storm drain discharges of dry season urban runoff. Local low income and working class residents have suffered damages to health, safety and liberty in their access to Aliso Creek and the Pacific Ocean.

Despite the obvious tangible and verifiable nature of these damages, South Laguna and the general public have yet to receive any effective regulatory assistance either from the State or Regional Water Boards. This failure to provide relief is not due to any lack of knowledge or information. The SDRWQCB has repeatedly and extensively investigated the mechanism by which storm drains physically convey fecal coliform bacteria and other contaminants downstream into the Aliso/Woods Canyon Regional Wilderness Park, South Laguna and the Aliso Creek County Beach. There remains no doubt that the City/County dry weather storm drain discharges are the cause of summer beach and ocean pollution.

Despite this clear and present causal relationship, the SDRWQCB and Staff have denied pleas from the public for remedial action in the form of abatement of nonseasonal storm drain urban runoff, beneficial reuse for sustainable treatment projects, water conservation and immediate temporary mobilized emergency capture/treatment options common among petrochemical, agribusiness and development economic sectors. In addition, the SDRWCB has not supplied a contingency emergency plan to protect our community and the public from current and summer dry weather MS4 storm drain discharges.

Instead, the Regional Board has relied on promulgating more general directives and future contamination tables, which may or may not be effective in abating polluted urban runoff. The proposed Tentative Order No. R9-2007-0002 is to accommodate the failures of inland Water Districts, SOCWA, Cities and County at the expense of the community, public and ocean ecology.

The SDRWQCB action when combined with the Staff and City/County history of ineffective action towards the residents and visitors of South Laguna, have the cumulative effect of giving second class status to the physical health and safety needs of the public in the Aliso Watershed. Thus any action by the Regional Board to approve the use of MS4 Storm Drain System to knowingly convey dry weather urban runoff flows is discriminatory and violates the State of California’s definition of Environmental Justice.

Conclusion

The general regulations, requirements and studies pertaining to the Aliso Creek Watershed and associated MS4 Storm Drain System are clearly not effective in controlling water pollution or the effects of artificially elevated flow rates during the area’s annual ten month dry season.

More than twenty years and $20 million dedicated to achieve compliance in a relatively small, compact 34 square miles residential development watershed is an enormous investment and, ultimately, waste of taxpayer revenues. The failure to achieve compliance represents a lost opportunity to demonstrate effective interventions to protect communities like South Laguna from polluted urban runoff and sends a message to the public that urban runoff pollution cannot be controlled.

Despite the various failed efforts over two decades, the fact remains numerous State laws are being violated by the SDRWCB for allowing the discharge of dry weather flows with elevated fecal coliform and related contaminate levels to continue to pollute daily the protected receiving waters of Aliso Creek and the Pacific Ocean. By this communication, the SLCA reserves the right to appeal any unfavorable decision perpetuating dry season urban runoff flows to Aliso Beach, South Laguna to the SWRCB and State Attorney General for timely relief.

The South Laguna Civic Association appreciates the efforts by the San Diego Regional Water Quality Control Board to consider the enormous impacts of uncontrolled dry weather urban runoff pollution before approving a genuinely effective Storm Drain Permit Program for the Aliso Watershed.

Respectfully submitted,

Michael Beanan, Director

Re: Comment – Tentative Order No. R9-2013-001 – Regional MS4 Permit - Place ID: 786088Wchiu

Dear Mr. Chiu:

This letter is written in response to the San Diego Regional Water Quality Control Board's Tentative Order R9-2012-0011 ("Permit") dated October 31, 2012. We have reviewed the draft of the Permit; there is no question if the Permit, as now proposed, goes into effect, it will impose excessively expensive and onerous regulations not only on local governments but on regional businesses and the public at large. The regulations, as written, are untested with no proof of improved water quality.

The Associated General Contractors of America ("AGC"), San Diego Chapter, represents over 1,000 firms that build the region's industrial, commercial, institutional, heavy highway and general engineering construction projects. We understand the importance of a clean, safe water supply; we want that for our region and for our families. However, it is imperative the regulations put in place to achieve this goal are reasonable, tested and known, to the extent possible, to produce the outcome of improving water quality.

The use of Water Quality Improvement Plans ("WQIP") is an excellent way to develop a cost-effective approach to improved water quality. We would encourage the Board to allow the WQIPs to be developed, ensuring public participation, and implemented before moving forward with enforcement of new regulatory requirements.

Other serious concerns are the stringent new proposal for stormwater retention and discharge and the non-existing source of funding to execute the proposed changes.

Our request is for the Regional Water Quality Control Board to allow the current Permit to remain in effect until WQIPs are developed for the 10 watersheds in District 9. This District needs to develop a Regional Permit that is based on rules and regulations known to be sustainable and effective. The development and use of WQIP's will give our communities that opportunity without the imposition of impossible regulation at horrendous economic cost to our regional cities, local businesses and the residents of our communities.

Thank you for hearing our concerns. If you have questions, please contact me at 858.558.7444.

Sincerely,

Debbie Day

Re: Comment - Tentative Order No. R9-2013-001, Regional MS4 Permit

Dear Mr. Chiu:

As a member of the San Diego Port Tenants Association, I am responding to the San Diego Regional Water Quality Control Board's Tentative Order R9-2012-0011 ("Permit") dated October 31, 2012. After reviewing the proposed Permit, I am concerned it will impose expensive and untested regulations on local governments, businesses, and residents. The new permit will impact the region without improving water quality.

I do understand the importance of clean, safe water to the region and as a member of the business community I am interested in improving San Diego's water. It is important, however, that we use our limited resources wisely, and ensure that our efforts produce the desired outcome of improving water quality. I applaud the Board's inclusion of Water Quality Improvement Plans (WQIP) as a first step in developing a cost-effective approach to improving our water. Analysis remains a critical component of a successful strategy, and I am glad to see that the Board is committed to finding the best possible solution to water quality improvement.

I am concerned however that the costs associated with enforcing and implementing the permit will have a negative impact on my business and San Diego's economy. The four primary areas of concern include: 1) the strict liability for exceeding water quality objectives; 2) the additional and changing requirements for development projects, impacting items such as storm water retention and discharge; 3) the preemption of WQIPs by new and changing regulatory requirements prior to allowing the WQIPs to be developed and implemented; and 4) the lack of reliable funding sources to implement these regulatory changes.

While it is necessary to hold individuals, businesses and governments accountable these measures must be reasonably achieved and provide a significant and positive impact on San Diego's water. I respectfully request that the Permit focus on the timely development of effective and enforceable WQIPs, and that each of these be developed through a process that ensures public participation. I also ask that the designation of Best Management Practices in each watershed be determined through the WQIP process rather than the one size fits all strategy currently proposed in the Permit. I ask further that, until the Board adopts a WQIP for a watershed, the provisions of the existing Permit remain in place for that watershed. Finally, in order to avoid unnecessary litigation I request that the Board adopt the WQIPs as Orders implementing the proposed Permit.

I urge you to adopt final permit language that is evidence-based and both environmentally and economically sustainable. Please contact me using the number below, X236, with questions. Thank you for your consideration.

Sincerely,

Dewey Youngerman

Reference: **ORDER NO. R9-2013-0001/NPDES NO. CAS0109266**

Subject: Sustainable Structural Source Control Storm Water BMPs

Board Members:

Water is the most precious resource next to clean air that we have in southern California. Without a safe, reliable source clean water for drinking, cooking, bathing, and commercial uses (high-tech research and manufacturing), the habitability of our region is seriously degraded. As you prepare the referenced order, I urge you to strongly consider the implementation and use of sustainable, structural source control BMPs that will capture, treat, and infiltrate storm and landscape water in-place.

Sustainability is defined as practices that allow the present generation to meet our needs without compromising the ability of the succeeding generations to meet their needs. Founded on economic, environmental, and social principles, sustainability ties together low-cost infrastructure to solve environmental issues in everyone's best interest.

The paper "California's Water Energy Relationship" prepared by the California Energy Commission noted that 19% of the state's electrical usage plus huge quantities of natural gas and diesel fuel were used in development, transportation, and usage of California's water. Of this nearly one-fifth of an already constrained resource, 22% is used in moving water from northern to southern California (10,300 GWh or 4.1% of the total electrical usage). Four percent is used in wastewater processing. A first line of defense is needed to reduce the need for more imported water and reduce the amount of water being processed and decrease the demand on an already overstressed electrical system.

Until "toilet to tap" becomes socially accepted, systems that naturally capture, treat, and slowly release storm and landscape water into the shallow and deep aquifers and waterways are needed. Such low-impact development systems are more sustainable and less costly than large storm water treatment plants that ultimately discharge huge plumes of clean water into the ocean. Examples of these LIDs are pervious concrete, permeable interlocking pavers, rain-gardens, storm detention basins, and porous asphalt.

Pervious concrete is in the simplest terms conventional concrete that is made without the inclusion of sand. It contains only cementitious material (portland cement and perhaps fly ash a recycled industrial by-product), water, and coarse aggregate. The concrete has a void content of 18% to 25% and is typically placed over a 6-inch to 10-inch recharge basin of 1-inch maximum size aggregate. Pervious concrete can be designed to accept the water from the parking lot, building roof, and hardscape so that even in the slowest draining soils, no water will leave the site.

Permeable interlocking pavers are small precast concrete blocks that portions of their corners removed. The ½-inch square opening at the intersection of four blocks is filled with small aggregate which allows water to infiltrate into a permeable base under the pavers. Their performance is very similar to pervious concrete.

The pre-infiltration storage capacity of one acre of PV/PIPs is approximately 9,600 cf or 2.7-in of storm water. The water that passes through PV/PIPs is cleaned by naturally occurring micro-organisms as it infiltrates the soil. Once in the soil, the water stays in a shallow aquifer where it available to surface vegetation or it eventually replenishes local waterways or it continues to deeper aquifers where it can be removed by pumping for domestic and commercial uses. Pervious concrete and permeable interlocking pavers will provide a 20 to 30-year service life with minimal maintenance. The uses of PC/PIPs are generally in parking lots, but they have also been used in sidewalks, nature trails, low-volume streets, and gutters. Caltrans has used pervious concrete in rest stop parking lots and on highway shoulders.

PC/PIPs used in parking lots free space for additional economic and recreational development. Development is constrained by the amount of parking that is available. When storm detention basins are used, valuable land is consumed in constructing an “attractive nuisance” that fills with trash during dry periods and breeds mosquitoes when wet. PV/PIPs are storm detention basins that have dual uses. An example of pervious concrete replacing a storm detention basin is Stratford Place, a 19 unit sub-division in Sultan, WA, where two detention basins were replaced with pervious concrete streets, sidewalks, and driveways allowing the developer to construct two additional homes with overall construction savings of $260,000. The completed site hydraulically mimicked the natural state. The Kaiser Hospital organization is now using pervious concrete for parking lots in its new projects.

PV/PIPs are energy efficient. Once constructed, the energy requirement is possibly an occasional sweeping to keep the surface voids open.

Rain gardens are attractive methods for capturing and treating storm water, but have a limited capacity compared to PV/PIPs. Detention basins can store large quantities of water, but are generally attractive nuisances. Porous asphalt pavement is similar to pervious concrete in that fine aggregate is removed to create the voided interstitial structure. The major drawback to PAP is that asphalt is a flexible material that is subject to weathering of the organic structural material. In hot weather, the PAP can be shoved by traffic closing the surface voids. Ultraviolet radiation degrades the asphalt surface (oil). Typical asphalt pavement surfaces are rejuvenated by spraying with fresh oil or a slurry seal. Neither option is viable for PAP since the surface voids would be closed. Further, as the price of oil rises and refining techniques are improved, the amount of asphalt oil is reduced and its price is increasing compared to portland cement which has been relatively stable.

In closing, a sustainable first line of defense is needed to capture, treat, and infiltrate storm and landscape water back into our natural system. Wyatt Troxell, a former board member of the Inland Empire Utility Agency, commented after a pervious concrete presentation that "for every acre of ground that covered by streets or buildings, we must import an acre-foot of water forever." Capturing, treating, and re-using water is essential.

Respectfully,

David J. Akers, P.E.
Civil Engineer

JAMUL DULZURA
COMMUNITY PLANNING GROUP
P.O. Box 613
Jamul, California 91935

December 14, 2012

Mr. Rich Crompton, Director
County of San Diego Department of Public Works
5510 Overland Ave, Ste 410
San Diego, CA 92123

SUBJECT: Comment – Tentative Order No.R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu

Dear Mr. Crompton,

The Jamul Dulzura Community Planning Group feels compelled to provide written comments on the draft San Diego Regional MS4 Permit to ensure that water quality regulations are practical, cost-effective, and scientifically based. While we are not directly regulated by the Regional MS4 Permit, we are concerned that public funds may have to be spent to comply with requirements that are not proven or effective, and that this will ultimately reduce the funding available for community projects and essential public services.

It is vital that the resources required to implement regulations are balanced with other public and environmental programs. For this reason we have joined the County's call to action to protect water quality while controlling the mounting and unsubstantiated costs of increased regulation on local governments, business and industry. As written, the Tentative Order will result in a significant and unprecedented level of regulation and cost without clear scientific basis or environmental benefit. The three main areas of concern in the draft permit are: 1) a far-reaching Bacteria Total Maximum Daily Load (TMDL), 2) additional requirements for development projects, and 3) performance standards that unnecessarily expose municipalities to third-party lawsuits. These requirements needlessly increase costs for regulated parties and may further constrain development in the region.

The cost to comply with the Bacteria TMDL is estimated between $2.6 billion and $4.9 billion for the named watersheds in the region over the 20 year TMDL compliance timeline, of which only 18 years remain. The numeric targets in this TMDL may never be attainable even if the County and other municipalities were to spend billions in public resources. This puts us in an untenable situation with the public, who will ultimately fund this effort. Technology simply does not exist to return urbanized watersheds back to pristine, "reference" conditions. The TMDL compliance targets must be attainable. The Bacteria TMDL requirement should not be incorporated into the MS4 Permit until there are more practical goals to work toward. We cannot ask the public to fund a program that will not succeed.

The cost of doing business in California has already pushed many businesses and developers out of the state. The draft permit will impose significant hardships on development. Permit requirements would require almost all development projects in the County to comply with hydromodification requirements, regardless of whether the projects themselves contribute to the problem. It also requires that new and re-development projects return site hydrology to pre-development conditions as opposed to pre-project conditions. Returning urban infill projects to conditions that existed under "natural", pre-urban conditions would be a substantial constraint to re-development. Over the last several years, local governments in San Diego have worked together with Regional Board staff and a host of technical experts to develop a Hydromodification Management Plan with reasonable and scientifically based standards. The

Regional Board recently approved that Plan. This draft permit ignores all of the good work invested in that Plan, which was developed at a significant cost to the public. In its place, it would impose new, one-size-fits-all requirements that impose a standard that is unrealistic and without scientific justification. The result of all these changes is that the structures built to mitigate development impacts will need to be bigger and will cost significantly more than the current approved program. Implementing these requirements would be an economic burden to our region and, are targeted at an unobtainable endpoint.

Accordingly, we would like for the Regional Board to honor existing plans, including the Hydromodification Management Plan. SANDAG has worked for many years through a comprehensive public process to develop the Regional Transportation Plan and Regional Comprehensive Plan that provides the framework for local General Plans. These plans recognize regional smart growth opportunity areas, including infill development. These are sound principals. Urban infill reduces aerial deposition which then reduces pollutant loading in urban runoff. Re-development is considered an environmentally preferable method of development. The MS4 permit should encourage re-development, retrofit landscapes, and green streets, through greater flexibility and reduced requirements rather than penalizing it with additional cost and constraints. To this end, any new regulations must be integrated into approved plans and must not be a burdensome, additional layer.

Finally, the draft permit includes performance standards that should be amended so that regulated municipalities are not unnecessarily exposed to third-party litigation. This Permit's receiving water limitations language is contrary to the intent of the federal Clean Water Act, which is to assure municipal agencies will be regulated to a reasonable standard. The State and Regional Water Boards have the discretion and a responsibility to ensure that water quality regulations are applied in a context that results in economic and environmental sustainability. It is imperative to reduce the threat of litigation when a municipality is engaged in a good faith effort to comply. The current receiving water provisions do not serve the environment, the public or the permittees. Public funds should be used to implement comprehensive programs that are proactive and adaptive to promote clean water goals.

Local government must have the flexibility to make policy decisions for the good of our residents. The 21 Copermittees in our region (the County, 18 cities, Port District, and Airport Authority) already spend close to $120 million a year to comply with current permit requirements. Heal the Bay's own report cards show that water quality at local beaches is improving. We would like to see the Regional Board adopt a permit that will be cost neutral and that local municipalities will have the flexibility to apply funding to priority areas.

We are hopeful that the final permit language will result in programs that make sense from both an environmental and economic standpoint. Please contact me if you have questions or would like to discuss our concerns.

Sincerely,

Michael Casinelli

December 14, 2012

Mr. Rich Crompton, Director
County of San Diego Department of Public Works
5510 Overland Ave, Ste 410
San Diego, CA 92123

Dear Mr. Crompton,

SUBJECT: Comment – Tentative Order No.R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu

As the Ramona Community Planning Group, a land use advisory group to the County of San Diego for land use issues in Ramona, we feel compelled to provide written comments on the draft San Diego Regional MS4 Permit to ensure that water quality regulations are practical, cost-effective, and scientifically based. While we are not directly regulated by the Regional MS4 Permit, we are concerned that public funds may have to be spent to comply with requirements that are not proven or effective, and that this will ultimately reduce the funding available for community projects and essential public services.

It is vital that the resources required to implement regulations are balanced with other public and environmental programs. For this reason we have joined the County's call to action to protect water quality while controlling the mounting and unsubstantiated costs of increased regulation on local governments, business and industry. As written, the Tentative Order will result in a significant and unprecedented level of regulation and cost without clear scientific basis or environmental benefit. The three main areas of concern in the draft permit are: 1) a far-reaching Bacteria Total Maximum Daily Load (TMDL), 2) additional requirements for development projects, and 3) performance standards that unnecessarily expose municipalities to third-party lawsuits. These requirements needlessly increase costs for regulated parties and may further constrain development in the region.

Finally, the draft permit includes performance standards that should be amended so that regulated municipalities are not unnecessarily exposed to third-party litigation. This Permit's receiving water limitations language is contrary to the intent of the federal Clean Water Act, which is to assure municipal agencies will be regulated to a reasonable standard. The State and Regional Water Boards have the discretion and a responsibility to ensure that water quality regulations are applied in a context that results in economic and environmental sustainability. It is imperative to reduce the threat of litigation when a municipality is engaged in a good faith effort to comply. The current receiving water provisions do not serve the environment, the public or the permittees. Public funds should be used to implement comprehensive programs that are proactive and adaptive to promote clean water goals.

Local government must have the flexibility to make policy decisions for the good of our residents. The 21 Copermittees in our region (the County, 18 cities, Port District, and Airport Authority) already spend close to $120 million a year to comply with current permit requirements. Heal the Bay's own report cards show that water quality at local beaches is improving. We would like to see the Regional Board adopt a permit that will be cost neutral and that local municipalities will have the flexibility to apply funding to priority areas.

We are hopeful that the final permit language will result in programs that make sense from both an environmental and economic standpoint. Please contact Jim Piva if you have questions or would like to discuss our concerns.

Sincerely,

Jim Piva

RE: Hydromodification Management Requirements of Draft Tentative Order No. R9-2013-0001 (San Diego Regional MS4 Permit)

Dear Ms. Hagen:

The purpose of this letter is to further address the nexus issue raised by members of the Regional Board at the Municipal Separate Storm Sewer Systems (MS4) permit workshop held on December 12, 2012. As the Copermittees commented at the workshop, we are concerned that the hydromodification management requirements would expose the Copermittees to significant litigation risk and may be unenforceable. Specifically, we are concerned with the provisions: (1) requiring Copermittees to compel development projects that have no impact on hydromodification to implement on-site or "alternative compliance" hydromodification mitigation measures; and (2) using "pre-development (naturally occurring)" runoff reference condition as applied to sites that are, in fact, developed. These requirements are located in Provision E(3)(c) of the Draft Tentative Order.

We are concerned that implementing these requirements would subject the Copermittees to liability under the takings clauses of the U.S. and California Constitutions and the Mitigation Fee Act because of the questionable nexus between a project's impacts on hydromodification and the hydromodification management measures in the Draft Tentative Order. When imposing a condition on a development permit, a local government is required under the federal and state constitutions to establish that the condition bears a reasonable relationship to the impacts of the project. This rule applies even to legislatively enacted requirements and impact fees or exactions.[1] Moreover, fees imposed on a discretionary ad hoc basis are subject to heightened scrutiny under a two-part test. First, local governments must show that there is a substantial relationship between the burden created by the impact of development and any fee or exaction.[2] Second, a project's impacts must bear a "rough proportionality" to any development fee or

[1] *Building Indus. Ass'n v. City of Patterson*, 171 Cal. App. 4th 886, 898 (2009).
[2] *Nollan v. California Coastal Comm'n*, 483 U.S. 825, 837 (1987).

exaction.[3] Under California law, the *Nollan/Dolan* heightened scrutiny test also applies to in-lieu fees.[4]

The Legislature has memorialized these requirements in the Mitigation Fee Act which establishes procedures that local governments must follow to impose impact fees.[5] Irrespective of whether the hydromodification management requirements are implemented by legislative act or on an ad hoc basis, the Copermittees' attempt to enforce them as proposed in the Tentative Order would likely result in claims alleging unconstitutional takings of private property and violations of the Mitigation Fee Act. This is because a developer could argue that limiting hydromodification impacts of already developed property to its "naturally occurring" state, or requiring hydromodification mitigation measures for impacts not imposed by the project, would not have a legally sufficient nexus to the impact of the development project.

Based on these concerns, we respectfully request that these provisions be modified. The Copermittees will be submitting comments on this issue and a redline of the Draft Tentative Order prior to the close of the public comment period on January 11, 2013. In the meantime, we are available to meet with you to discuss this important issue.

Sincerely yours,

JAN I. GOLDSMITH, City Attorney

SAN DIEGO PORT TENANTS ASSOCIATION

December 19, 2012

Mr. David Gibson, Executive Officer
California Regional Water Quality Control Board
San Diego Region
9174 Sky Park Court, Ste. 100
San Diego, CA 92123-4340

Dear Mr. Gibson,

I am contacting you on behalf of the San Diego Port Tenant's Association (SDPTA). The Association was formed in 1989 as a non-profit mutual benefit corporation and is made up of over 250 members that include Tideland's businesses that are tenants of the Unified Port District. On behalf of the Board of Directors of the San Diego Port Tenants Association, please allow me to offer the follow comments and suggestions in regard to the Regional MS4 Permit:

Monitoring and Assessment. With regard to the use of members of the public to support volunteer monitoring, SDPTA is very concerned about the possibility for mis-interpretation of this provision. Well-intentioned but overly-aggressive parties may interpret this provision to allow volunteers to enter private property, via the public right-of-way, looking for unlawful or improper discharges. This raises several legal concerns and poses significant liability issues for copermitees should a volunteer be injured in the course of an unauthorized inspection, or if private property is damaged, or if manufacturing processes are adversely affected as a result of the unauthorized intrusion.

We recommend that the language governing the use of volunteers be very explicit regarding the intent of the Board which we believe is to help

2390 SHELTER ISLAND DRIVE, SUITE 210 • SAN DIEGO, CALIFORNIA 92106 • (619) 226-6546 • FAX (619) 226-6557 • EMAIL: sharon@sdpta.com, sophie@sdpta.com
www.sdpta.com

copermitees reduce monitoring costs by utilizing volunteers to monitor properties that are part of the public right-of-way.

Non-Storm Water Discharges. The Regional MS4 Permit currently specifies that air conditioner condensation is a non-storm water discharge that must be directed to landscaped areas or other pervious surfaces, where feasible. SDPTA is concerned about the cost of compliance for this particular. Re-routing condensation lines in existing buildings, more often than not is very expensive. We would suggest that the new requirements be limited to development/re-development. In addition, discharges from fire suppression equipment maintenance activities can be treated with BMPs and in such cases should not be considered an illicit discharge.

Finally, The Regional MS4 Permit Generally specifies that all non-storm water discharges must be terminated rather than making a distinction that discharges with permits are actually authorized. SDPTA recommends that the Regional Board add language for clarification, something like the following:

> *Each Copermittee shall effectively prohibit all types of non-storm water discharges into its MS4 nless such discharges are authorized by a separate National Pollutant Discharge Elimination system (NPDES) Permit.*

On behalf of SDPTA, I want to thank the Regional Board and Staff for the very collaborative nature of this process. We thank you for the opportunity to submit these comments, and appreciate your consideration.

Best regards,

Sharon Cloward

Julian Community Planning Group

P.O. Box 249, Julian, CA 92036

January 4, 2013

Ms. Stephanie Gaines, Land Use/Environmental Planner
DPW/Watershed Protection Program (M.S. 0326)
5510 Overland Avenue, Suite 410
San Diego CA 921123

Dear Stephanie;

First I want to thank you for meeting with our Planning Group to discuss the reissuance process regarding the region NPDES Permit (MS4 Storm Water) with particular focus on the Total Maximum Daily Load plan (TMDL) and the effects that may have on our community.

After reviewing the documents provided to us, discussing the issue with you, and considerable discussion by our Group, the following statement has been prepared to express the position of the Julian Community Planning Group:

1) As written, the tentative order MS4 will result in a significant, unprecedented and likely unattainable level of regulation and unsustainable cost. The tentative order includes:

A. Far reaching water quality improvements.

B. Performance standards that cannot conceivably be attained.

C. Transferring the state's responsibility of cost to the local agencies, including testing, liability, and enforcement.

D. Ignoring of existing plans developed by other agencies.

E. Requiring the co-permittee to comply with unknown conditions.

The far reaching water quality improvements likely never can be attained, especially in urban developed areas. Will the Regional Water Quality Control Board remove legal conforming residences to obtain pre-development conditions; or require all existing developments to retrofit in order to attain the requested standards?
There are also jurisdictions over which the co-permittee has no authority and therefore can not require compliance. Those include Caltrans, State lands and parks, Federal lands and parks, and Indian Reservations.

2) The San Diego Regional Water Quality Control Board is attempting to pass all cost and responsibility to the co-permittee. Why would any agency accept these liabilities and costs? The County of San Diego has estimated the cost to comply with the Bacteria TMDL alone to be between 2.6 and 4.9 million dollars.

3) The County of San Diego, Cities and SanDag have worked extensively to develop Transportation plans, regional comprehensive plans and general plans that address the concerns shown in the tentative order MS4. The San Diego Regional Water Quality Control Board has ignored this effort in the new proposed regulation.

4) The proposed MS4 permit requires the co-permittees to accept new regulation without knowledge of what they are or their impacts.

5) The requirement of returning all watersheds back to pristine reference level is just not practical nor feasible.

6) The County of San Diego should not require the portion of the County in the Colorado River Basin to comply with San Diego County Water Quality Control Board requirements. The issues and conditions in the Colorado River Basin are not similar to those in the western coastal portion of the County.

Thank you for including our comments in your presentation to the San Diego Region Water Quality Control Board.

Sincerely

Jack D. Shelver

Attn: Mr. Tomas Morales

Subject: Tentative order No. R9-2013-0001
Municipal Separated Storm Sewer Systems (MS4s)
Draining the Watersheds within the San Diego Region

Dear Mr. Morales,

I would like to thank you for hosting the two recent public workshops on the Tentative Order No. R9-2013-0001 regarding MS4s Draining the Watersheds within the San Diego Region. They were very informative and I appreciated the opportunity to address the Board at both hearings.

Our company is close to completing our entitlements for a sustainable, walkable, "green" master planned community in Otay Ranch. Our property is adjacent to Otay River west of Otay Lakes. We have spent thousands of man hours and millions of dollars planning a community that takes the environment into consideration, including water quality.

As I mentioned when I addressed the Board, the Otay River Valley west of the dam is barren and full of invasive plant species that literally suck the water out of the ground. In following the hydromodification requirements that were implemented only about a year ago, we have devised a plan that will clean our storm water runoff prior to introducing it into the Otay River. Once the water is reintroduced into the river we will remove the invasive plants and establish wetland varieties which will flourish and bring the river valley back to what it once was many years ago. We are able to accomplish this because the Otay River west of the dam is currently exempt from hydromodification requirements.

This exemption was put into place based on scientific research and technical expertise of the Hydromodification Task Force. This committee, representing environmental and engineering experts determined that limiting runoff to certain bodies of water and rivers within your jurisdiction would not be beneficial to the health of those watersheds. Due to the influence of the Otay Lakes and Dam upstream of our project, the Otay River was determined to be one of the bodies of water that would benefit from the exemption.

If the exemption for the Otay River is deleted from the new Tentative Order, our land plan will be altered and our restoration efforts will not be put in place.

In addition, the proposed Tentative Order also calls for retention onsite of the 24 hour 85th percentile storm event. Similar to the issue of hydromodification, retention of flows from the majority of storm events will adversely impact this watershed that is described as being "starved" for runoff in the Otay River Watershed Management Plan. Since infiltration is infeasible on our site due to soil conditions, the permit proposes to arbitrarily increase our bioretention facilities by 25%, a number that does not appear to have any scientific basis.

We applaud the new permit for looking at regional solutions through the implementation of the Watershed Improvement Plans. However, we should be allowed to operate under the current permit until the Watershed Improvement Plans determine the best regional solutions for the health of each watershed. Specifically, we request that the hydromodification exemptions be left in place and the retention requirements not be added to the permit until the Watershed Improvement Plans determine whether retention is beneficial to the watersheds.

Sincerely,

Jeff O'Connor
Director of Operations

Mr. Wayne Chiu, P.E.
California Regional Water Quality Control Board, San Diego Region
9174 Sky Park Court, Suite 100
San Diego California 92123-4340

Dear Mr. Chiu,

SUBJECT: Amendment of Draft Permit Language for Fire Fighting Activities – Tentative Order No.R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu

As a local authority affected by the most recent MS4 Draft Permit we feel compelled to provide written comments to ensure that water quality regulations are practical, cost-effective, and scientifically justified. Since the County Fire Authority will be directly regulated by the Regional MS4 Permit, we are concerned that public funds and critical personnel may have to be spent or resourced to comply with requirements that are unnecessary, and that this will ultimately reduce the emergency personnel and funding available for essential public services.

It is vital that the resources required to keep our communities safe from the threat of fire be solely purposed for that task. For this reason the 15 rural fire agencies within San Diego County have joined the County Fire Authority's call to action to protect water quality while controlling the mounting and unsubstantiated costs of increased regulation on local governments, business, and industry. As written, the Tentative Order will result in a significant and unprecedented level of regulation and cost without clear scientific basis or environmental benefit. The Fire Authority along with the 15 rural agencies believe that the language incorporated in a re-issued permit should not deviate from the current permit unless the RWQCB can provide clear evidence that emergency fire fighting activities and fire sprinkler line flushing significantly impact stormwater runoff, and that the increased costs associated with proposed changes are justified and feasible. Accordingly, we ask that the Regional Board honor the language in the existing permit and make no changes at this time.

In order to provide the best service possible the Fire Authority and its 15 participating agencies must be focused on emergency activities and not with implementing BMPs or removing debris caused by the emergency after the fact. This should be the sole responsibility of the entities owning or operating the sites or facilities for which the fire agencies are responding. The Fire Authority also believes that existing requirements are sufficient to ensure that the flushing of fire sprinkler systems has minimal impact to storm water quality and should not be prohibited. These activities exist for the safety of the public and the environment and should be continued in their current fashion pursuant to existing permit requirements.

We are hopeful that the final permit language will result in programs that make sense from a public safety, environmental and economic standpoint. Please contact Greg Schreiner, Fire Marshal, if you have questions or would like to discuss our concerns. His number is 858-495-5425, email is greg.schreiner@sdcounty.ca.gov

Sincerely,

Herman Reddick,

RE: Comments on Tentative Order Number: R9-2013-0001

Dear Mr. Chiu:

I am a professor of microbiology and general biology for San Diego County Community Colleges and a member of the San Diego Coastkeeper Community Advisory Council. I respectfully submit the following comments on the draft San Diego Regional Municipal Separate Storm Sewer System permit, Tentative Order No. R9-2013-0001.

Urban runoff is the San Diego region's most urgent pollution problem. Arguably, it is the most difficult to solve. In a region known for its beaches and strong tourism economy, polluted runoff makes our beaches and waterways unsafe for swimming, fishing and other recreation for at least 72 hours after a rain event. Even in dry weather, our "urban drool" from residents and businesses overwatering lawns becomes a major pollution source. A recent scientific article by Viswanathan *et al.* delineated 'urban runoff' as a problem in almost every watershed in San Diego County:

Watersheds and Description of Associated Concerns

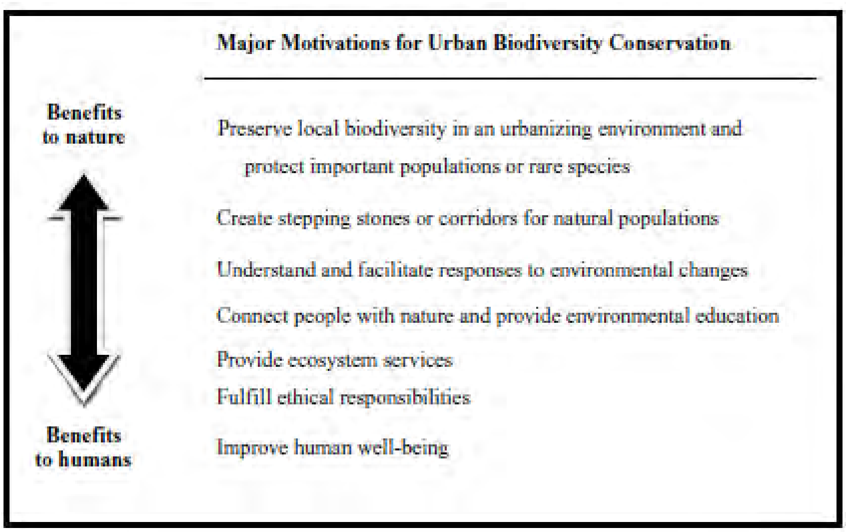
Name of watersheds	Water quality concerns	Impacts
Carlsbad	Surface water quality degradation, beach closures, sedimentation, habitat degradation, and eutrophication	Urban runoff, agricultural runoff, sewage spills, domestic animals, and livestock
Otay	Surface water quality degradation, sedimentation, habitat degradation, and loss	Urban runoff, agricultural runoff, resource extraction, septic systems, and marinas
Penasquitos	Decline in surface water quality, beach closures, sedimentation, habitat degradation, and eutrophication	Urban runoff, sewage spills, dredging, and landfill leachate
Pueblo San Diego	Decline in surface water quality, habitat degradation, and toxins	Urban runoff
San Diego	Decline in surface water quality, degrading habitats, sediment, and eutrophication	Urban runoff, agricultural runoff, mining operations, sewage spills, and sand mining
San Dieguito	High levels of coliform bacteria, nutrients and sediment, resulting in declining surface water quality and habitat degradation	Urban runoff, agricultural runoff, and domestic animals
San Juan	Decline in water quality and habitat loss	Urban runoff, agricultural runoff, and military operations from Camp Pendleton are the major sources of pollution in this watershed
San Luis Rey	High levels of coliform bacteria, nutrients and sediment, resulting in declining surface water quality and habitat degradation	Agriculture and orchards, livestock, urban runoff, sand mining, and septic systems
Santa Margarita	Surface and groundwater quality degradation; habitat loss	Excessive sedimentation from development and agricultural areas
Sweetwater	Declining surface and groundwater quality and habitat degradation	Agricultural and urban runoff
Tijuana	Most severely impacted watershed in San Diego Basin	Urban runoff, sewage spills, industrial discharges, agricultural, livestock, and septic systems

April 10 and 11, 2013
Item No. 8
Supporting Document No. 5

The good news is by working together as a community, we can solve this challenging public health problem. The Water Quality Improvement Plans proposed in the draft permit have the potential to become powerful tools to help us improve water quality within our watersheds. However, the Copermittees cannot be tasked with creating these plans alone. Specifically:

- The Permit should require formation of a stakeholder advisory group for each watershed that includes representatives of environmental groups with knowledge of the watershed.
- This stakeholder advisory group should work closely with the Copermittees and a regional board staff member while the Water Quality Improvement Plans are being developed to ensure these plans aggressively pursue water quality gains.
- The stakeholder advisory process should include accountability and measureable milestones to ensure the goals of the Permit are being met.

By taking advantage of the knowledge and resources of diverse stakeholders like municipalities, businesses and residents, our region can be on the cutting-edge of addressing urban runoff and creating healthier communities and watersheds. But this can only be achieved if these diverse voices are impacting the planning process in a meaningful way. The impacts of reaching our goals together are two-fold, resulting in a win-win situation for the environment and society as described by Dearborn and Kark :



As San Diego continues to grow at 10% annually, it is imperative that we "understand and facilitate responses to environmental changes" as not only an 'ethical responsibility', but to improve our own human well-being. I've seen constant growth (even in the past 4 years of "recession") in the East County, including a steady degradation of the biodiversity of the San Diego River despite the best conservation efforts of San Diego Mission Trails and other county and city parks. What occurs upstream is beyond the control of parks and land set aside for conservation. Urban runoff is a major contributor to this.

San Diego County Community Colleges and the San Diego Coastkeeper Community Advisory Council recognize the challenge urban runoff presents to our region, and we want to do our part to solve the problem. San Diego County Community Colleges and the San Diego Coastkeeper Community Advisory Council are interested in participating in a Water Quality Improvement Plan development process for the San Diego River watershed.

San Diego County Community Colleges the San Diego Coastkeeper Community Advisory Council urges the Regional Board to enhance the stakeholder participation opportunities as Water Quality Improvement Plans are developed and then approve the permit.

Respectfully submitted,

Professor Hector Valtierra,
M.A. (Liberal Arts), M.S. (Biochemistry), MPH (Public Health)
San Diego County Community Colleges
San Diego Coastkeeper Community Advisory Council

Wayne Chiu, P.E.
San Diego Regional Water Quality Control Board
9174 Sky Park Court, Suite 100
San Diego California 92123-4340

Dear Mr. Chiu:

Subject: Draft Municipal Storm Water Permit, Tentative Order No. R9-2013-0001

Thank you for the opportunity to comment on the San Diego Regional Water Quality Control Board's (Regional Board) draft Municipal Storm Water Permit (Tentative Order No. R9-2013-0001, hereinafter referred to as "Tentative Order"). The City of San Diego (City) participated with the twenty one permittees in the San Diego region subject to the current Municipal Permit (Copermittees) to develop a collective set of comments on the Tentative Order. The Copermittee comments were submitted separately by the County of San Diego and are supported by the City. In addition, the City submits this letter to provide additional comments on the Tentative Order.

- *Revise the Tentative Order to allow for compliance with Discharge Prohibitions, Receiving Water Limitations, and Areas of Special Biological Significance (ASBS) and Total Maximum Daily Load (TMDL) requirements if a Copermittee is implementing an approved Water Quality Improvement Plan (WQIP) that includes a reasonable assurance analysis.* The City's objective is for the Tentative Order to allow the City to efficiently integrate its TMDL, ASBS and Municipal Permit requirements into a program that allows for compliance through implementation. The WQIP developed by Regional Board staff provides an innovative, thoughtful, and strategic framework for such an approach. However, the Tentative Order does not provide a mechanism for the City to achieve compliance with ASBS and TMDL regulations and the Tentative Order's prohibitions and limitations while implementing the WQIPs. The City supports the proposed process offered by the San Diego Copermittees which links compliance to the WQIPs provided that a reasonable assurance analysis is provided which demonstrates that water quality goals will be met if the WQIP is implemented. The City requests inclusion of the Copermittee's "WQIP-Based Compliance" option in the Tentative Order.

- *Incorporate 4 options from the adopted Bacteria I TMDL into the Tentative Order.* The following options are included in the Bacteria I TMDL and consistent with federal regulations. These options should be included in the Tentative Order because they encourage

Transportation & Storm Water Department
9370 Chesapeake Drive, Suite 100, MS 1900 • San Diego, CA 92123
Hotline (619) 235-1000 Fax (858) 541-4350

efforts to target the highest polluting outfalls, address multiple pollutants comprehensively, and improve best management practices through adaptive management.

1. Mass (load)-based method for complying with Water Quality Based Effluent Limits (WQBELs). A mass (load)-based approach would allow the City to achieve water quality improvements more quickly and efficiently by targeting the highest polluting outfalls in each watershed.
2. BMP-based method for complying with WQBELs. The Bacteria I TMDL allows for BMP-based WQBELs, and is supported by federal regulations provided that measurable goals are set and efforts are iteratively adapted if water quality targets are not initially met. The WQIP-Based Compliance framework proposed by the Copermittees in their comment letter qualifies as a BMP-based program, consistent with federal regulations.
3. Adjusting interim Bacteria I TMDL compliance dates. The Bacteria I TMDL allows for Copermittees to propose alternative interim dry and wet weather compliance dates if the Copermittee proposes to address multiple pollutants (in addition to bacteria) through a comprehensive approach.
4. TMDL Re-opener. The Bacteria I TMDL states that the TMDL will be re-opened within 5 years after the effective date or later as new information becomes available to improve the science supporting the TMDL. The Tentative Order should include a corresponding acknowledgement that the adopted Order will be re-opened if the Bacteria I TMDL is amended.

- *Revise the Tentative Order to uphold the previously adopted San Diego Hydromodification Management Plan (San Diego HMP), Resolution No. R9-2010-0066.* This plan has been in effect for less than two years. The San Diego HMP was developed by an expert consultant team that utilized extensive scientific studies, analysis and modeling to determine the appropriate hydromodification control criteria. Additionally, the Copermittees have embarked upon a $1.5 million, 5 year monitoring plan to validate the parameters and design criteria. There have been no scientific advances in the last 2 years to justify revisions to the San Diego HMP. Therefore, we request allowing the Copermittees to continue implementation of the current San Diego HMP. Additionally, the Tentative Order expands the application of HMP controls beyond a project's impact by: 1) imposing HMP requirements on sites that have no potential of causing erosion downstream; and 2) setting pre-development as a baseline for HMP mitigation. The City requests limiting the HMP requirements to only the project's impact.

- *Replace the monitoring and assessment requirements in the Tentative Order (Provision D.4) with the strategic monitoring approach developed collectively by the Copermittees.* The Copermittees' approach will more efficiently and effectively address critical questions necessary to adaptively manage the City's programs and realize our storm water quality goals.

- *Add the San Diego Unified Port District (Port) as a Municipal Separate Stormwater Sewer System (MS4) Operator to the Shelter Island Yacht Basin Copper TMDL.* The Port should be listed as an MS4 Operator because the Port is responsible for storm drains in parking lots within the Port's jurisdiction that drain to the Shelter Island Yacht Basin.

Thank you for the opportunity to comment. We look forward to continued discussions in finding ways to improve and protect water quality. If you have any questions please contact Drew Kleis, Program Manager at (858) 541-4329.

Sincerely,

Kris McFadden

Subject: City of Imperial Beach comments on the proposed Tentative Order No. R9-2013-0001

Dear Mr. Chiu:

The City of Imperial Beach appreciates this opportunity to provide comments on the Tentative Order No. R9-2013-0001. We recognize the effort made by RWQCB staff to consider and discuss the various stakeholder positions for this new permit and agree that developing a new permit through a series of focused meetings was innovative and successful in getting the stakeholders to understand each other's positions for achieving the same end goal of improved water quality. We hope that similar efforts for collaboration are continued at the water board.

The City of Imperial Beach has been actively involved in the focus meeting process and subsequent special workshops held on the new permit. The City also participated in the development of the San Diego Regional Copermittees response to the new permit and support the redline draft being proposed by the Copermittees. The comments on the new permit below are provided in addition to the comments being made by the San Diego Copermittees. We look forward to working with the RWQCB on the final development of this new storm water permit and are optimistic that this new permit will allow for the more efficient use of community resources to implement a successful storm water management program.

Comments by the City of Imperial Beach on Tentative Order R9-2013-0001:

- Provision A: The point of jurisdictional compliance under provision A is vague and presents the potential for unintended 3rd party lawsuits. If the regional board truly embraces an adaptive approach to address priority pollutants then that needs to be explicitly clear in the new permit. It is not clear if compliance means meeting the water quality objective or implementing an adaptive WQIP. We recognize the position by the Regional Board to not get ahead of the State Water Board especially in light of the recent November 20th workshop in Sacramento to discuss concerns on the limitations of receiving water limitations in municipal storm water permits, however, we want to strongly emphasize the importance of preventing unnecessary and costly 3rd party lawsuits in the new permit.
- Provision D: We strongly support the San Diego County Copermittee's recommended changes to the monitoring program in Provision D. The Copermittees met with RWQCB staff on multiple occasions after the focus meetings to discuss recommended changes. Please incorporate a monitoring program such as the one suggested by the Copermittees that uses a scientific and question driven monitoring approach that most effectively uses public funding to demonstrate any statistically significant changes in water quality.
- E.3.B.2.e Priority Development Project Categories: The definition for a priority development project that "discharges directly to" an Environmental Sensitive Area was changed in this permit. The clarifying language from the last permit specified flows that "discharge directly to" <u>as outflow from a drainage conveyance systems that is comprised entirely of flows from the subject development and not commingled with flows from adjacent lands</u>. It is my understanding from the RWQCB that their intent was not to change the definition for discharging to an Environmentally Sensitive Area and request that the clarifying language from the old permit is reintroduced for clarity.

- E.3.B.3.b Priority Development Project Exemptions: Major maintenance on roads, alleys, and sidewalks should be treated different than other redevelopment projects because design standards and public safety take priority over water quality regulations. It is not practical to incorporate green streets and LIDs into every street retrofit project due to site feasibility, conflicting design standards, and increased project costs; however, the Copermittees should be allowed the flexibility to consider the application of green streets and LIDs into street retrofit projects whenever and wherever feasible.
- E.3.B.3.c Priority Development Project Exemptions: Single family residential redevelopment projects should not be held to the specific design standards for regular priority development projects because it discourages redevelopment of old properties. LID and HMP sizing criteria requires hydrology reports and engineered BMP design plans that captures the 24-hr 85th percentile storm event and prevents not more than 10 percent of the naturally occurring flow off the site, which is beyond the normal scope of many single family residential projects. These regulations are complex and hard to understand for the regular home owner and general contractor. Requiring costly engineered BMP plans for single family residential redevelopment projects disproportionally impacts lower income communities like Imperial Beach that already have a hard time encouraging new development. We support permit language that does not require engineered BMP solutions for single family residential projects such as the disconnection of impervious surfaces, improved landscaped areas with 12" of loamy soil, and incorporation of LID concepts into the project area.
- E.3.C.2 Hydromodification Management BMP Requirements: We strongly support the recommended HMP changes discussed at length by the San Diego Copermittees. Most importantly the City requests the HMP exemptions that were removed from the previous permit be reintroduced. The entire City of Imperial Beach discharges into a tidally influenced area and does not contribute to downstream erosion. Requiring HMP on project sites in the City does not make any sense and furthermore, requiring offsite mitigation somewhere in the watershed essentially translates into a tax on development that does not mitigate for any downstream flow impacts from the project site.
- E.3.C.3.b Alternative Compliance Project Options: It does not seem appropriate for the RWQCB or any government agency to regulate alternative compliance based on LEED Certified Redevelopment projects when there are other green building certification programs on the market. Being LEED Certified does not necessarily modify storm water runoff pollution. LEED accreditation is a noteworthy building accomplishment but it is bad policy to write LEED into the regulations.
- Attachment E Provisions for TMDLs: We support the comments made by the County of San Diego related to incorporating the requirements of existing TMDLs into this new permit.

Sincerely,

Chris Helmer

RE: Comments on Tentative Order Number: R9-2013-0001

Dear Mr. Chiu:

Curious Company respectfully submits the following comments on the draft San Diego Regional Municipal Separate Storm Sewer System permit, Tentative Order No. R9-2013-0001.

Urban runoff is the San Diego region's most urgent pollution problem. Arguably, it is the most difficult to solve. In a region known for its beaches and strong tourism economy, polluted runoff makes our beaches and waterways unsafe for swimming, fishing and other recreation for at least 72 hours after a rain event. Even in dry weather, our "urban drool" from residents and businesses overwatering lawns becomes a major pollution source.

The good news is by working together as a community, we can solve this challenging public health problem. The Water Quality Improvement Plans proposed in the draft permit have the potential to become powerful tools to help us improve water quality within our watersheds. However, the Co-permittees cannot be tasked with creating these plans alone.
Specifically:

* The Permit should require formation of a stakeholder advisory group for each watershed that includes representatives of environmental groups with knowledge of the watershed.
* This stakeholder advisory group should work closely with the Co-permittees and a regional board staff member while the Water Quality Improvement Plans are being developed to ensure these plans aggressively pursue water quality gains.
* The stakeholder advisory process should include accountability and measureable milestones to ensure the goals of the Permit are being met.

By taking advantage of the knowledge and resources of diverse stakeholders like municipalities, businesses and residents, our region can be on the cutting-edge of addressing urban runoff and creating healthier communities and watersheds. But this can only be achieved if these diverse voices are impacting the planning process in a meaningful way.

Curious Company recognizes the challenge urban runoff presents to our region, and we want to do our part to solve the problem. Curious Company is interested in participating in a Water Quality Improvement Plan development process for San Dieguito Watershed.

Curious Company urges the Regional Board to enhance the stakeholder participation opportunities as Water Quality Improvement Plans are developed and then approve the permit.

Respectfully submitted,
Jessica Toth

Subject: Comment – Tentative Order No. R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu.

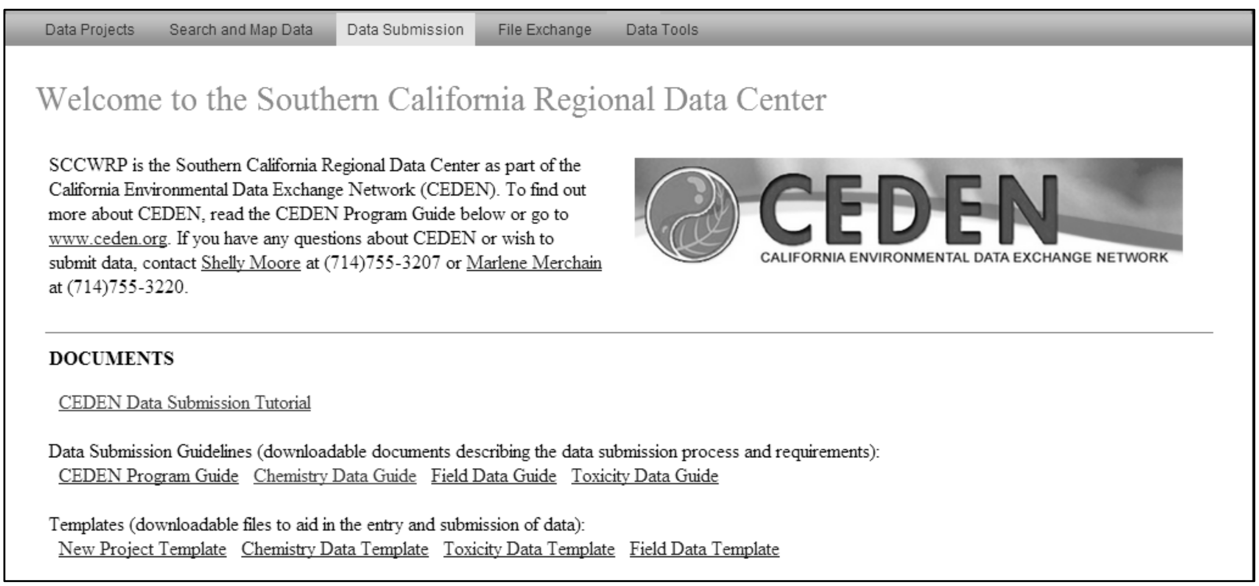
Topic: Requirement to upload data to CEDEN

Section F.3.b.(3) of the Tentative Order requires that, “Any monitoring data utilized in developing the Annual Report must be uploaded to the California Environmental Data Exchange Network (CEDEN).”

We ask the RWQCB to either remove this requirement or make it optional. We see the following problems with the above requirement:

1. At its core, this new permit relies on Water Quality Improvement Plans which are to be prepared on a watershed by watershed basis. Bifurcating the reporting of monitoring information from the goals and objectives of the WQIPs makes the data unintelligible and superfluous to the public. Data should be reported through independent data warehouses associated with each of the ten WQIPs.

2. The phrase “any monitoring data” is ambiguous and creates a compliance burden on co-permittees that CEDEN currently does not support. As seen in the screen shot below, CEDEN supports only Chemistry, Field, and Toxicity data. The overall monitoring task under the Order includes a much larger data set.



3. Uploading data to CEDEN seems redundant since the Order is also asking co-permittees, “Any monitoring and assessment data utilized in developing the Annual Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.” A WMA-based data warehouse is a more practical and comprehensive source of data for the RWQCB, other co-permitees, and public.

4. In practical terms, uploading "any monitoring data" to CEDEN is unnecessary. CEDEN, through its data upload process, basically provides data standardization. However, the Order already requires that all monitoring data be compatible with SWAMP, the Surface Water Ambient Monitoring Program adopted by the State Water Board. So CEDEN formats must be identical to SWAMP, which happens to be the case, nullifying the value added by CEDEN. Co-permittees should not be burdened with this additional cost and statutory obligation.

   The California Department of Water Resources or the State Water Board requires that grant funded projects submit their monitoring data to CEDEN. The primary recipients of these grants are non-government organizations employing citizen volunteers, and projects that do not have any legal obligation to meet stormwater permit requirements. Since their monitoring programs may not meet statutory standards, achieving some level of standardization through CEDEN in these situations is a reasonable objective. However, this is not the case with stormwater permittees.

Respectfully yours,

Joe

San Diego, CA 92123

RE: Tentative Order No. R9-2013-0001/Municipal Separated Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region

Dear Ms. Walsh:

Thank for the opportunity to provide comments on Tentative Order No. R-9-2013-0001. Our company is close to completing entitlements for a sustainable, walkable master planned community within the Otay Ranch. We have been processing these entitlements for the past four years and have expended millions of dollars planning a community that protects the environment, and specifically, water quality.

Our project is located north of the Otay River Valley and has been designed consistent with the permit approved by the Board just a year ago. In following the requirements in the current permit, we have devised a plan that cleans all project storm water runoff prior to introducing into the Otay River. This plan is contingent upon maintaining the hydromodification exemption for the Otay River.

The Otay River exemption was put into place based on the scientific and technical expertise of the Hydromodification Task Force. This committee, representing environmental and engineering experts, determined that limiting runoff to certain bodies of water and rivers within your jurisdiction would not be beneficial to the health of those watersheds. Due to the influence of the Otay Lakes and Dam upstream of our project, your Board approved an exemption for the Otay River.

If the Otay River exemption is removed from the new Tentative Order, our land plan would need to be dramatically altered, in effect, wiping out years of planning, engineering and environmental work.

The proposed Tentative Order also calls for retention of the 24 hour 85th percentile storm event onsite. Retention flows from the majority of storm events will adversely impact the Otay River watershed that is described as being "starved" for runoff in the Otay River Watershed Management Plan. Since infiltration is infeasible on our site due to soil conditions, the new permit proposes to arbitrarily increase our bio-retention facilities by 25%, a number that does not appear to have any scientific basis but would severely impact our land plans.

We certainly appreciate efforts to identify regional solutions through implementation of the Watershed Improvement Plans; however, we must be allowed to operate under the current permit until the Watershed Improvements Plans determine the best regional solutions for each watershed. Specifically, we ask that the Otay River hydromodification exemption remain in place and the retention requirements not be added to the permit until and if the Watershed Improvement Plans determine if retention is beneficial to the Otay River watershed.

Thank you for your consideration.

Sincerely,

Ranie Hunter

Wayne Chiu, P.E.
California Regional Water Quality Control Board, San Diego Region
9174 Sky Park Court, Suite 100
San Diego, CA 92123-4340

Dear Mr. Chiu:

SAN DIEGO COPERMITTEE COMMENT SUBMITTAL – TENTATIVE ORDER NO. R9-2013-0001, REGIONAL MS4 PERMIT, PLACE ID 786088WCHIU

Thank you for the opportunity to comment on Tentative Order No. R9-2013-0001, NPDES No. CAS0109266, *National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region* (Tentative Order). The County of San Diego, as Principal Permittee, submits the attached comments on behalf of the 21 Copermittees subject to Regional Water Quality Control Board (Regional Board) Order 2007-0001, the existing San Diego County MS4 Permit.

These comments were developed jointly with the San Diego Copermittees and should be considered to represent a general group consensus. However, although we have strived to obtain unanimity in our comments and proposed permit revisions, individual Copermittees do sometimes have differing opinions. These will be expressed in separate written comments provided by individual Copermittees.

We greatly appreciate the public process employed to date toward the development of a new and improved permit for the San Diego Region, as well as the openness of staff and Regional Water Quality Control Board (Regional Board) members in listening to the issues and concerns put forth by the County and numerous other interested parties. The San Diego Copermittees' recommended edits to the Tentative Order are attached. The supporting rationale for each is provided in a separate comment table. Most edits are in the form of redline-strikeout changes.

Again, thank you for the opportunity to participate in the development of a new permit for the San Diego Region. We look forward to continued discussion of the issues raised above. If you have questions, please contact Todd Snyder, Land Use & Environmental Planning Manager, at (858) 694-3482, or todd.snyder@sdcounty.ca.gov.

Sincerely,

CID TESORO, Manager
Department of Public Works

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN DIEGO REGION

TENTATIVE
ORDER NO. R9-2013-0001
NPDES NO. CAS0109266

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS WITHIN THE SAN DIEGO REGION

The San Diego County Copermittees in Table 1a are subject to waste discharge requirements set forth in this Order.

Table 1a. San Diego County Copermittees

City of Carlsbad	City of Oceanside
City of Chula Vista	City of Poway
City of Coronado	City of San Diego
City of Del Mar	City of San Marcos
City of El Cajon	City of Santee
City of Encinitas	City of Solana Beach
City of Escondido	City of Vista
City of Imperial Beach	County of San Diego
City of La Mesa	San Diego County Regional Airport Authority
City of Lemon Grove	San Diego Unified Port District
City of National City	

After the San Diego Water Board receives and considers the Orange County Copermittees' Report of Waste Discharge and makes any necessary changes to the Order, the Orange County Copermittees in Table 1b will become subject to waste discharge requirements set forth in this Order after expiration of Order No. R9-2009-0002, NPDES No. CAS0108740 on or after December 16, 2014.

Table 1b. Orange County Copermittees

City of Aliso Viejo	City of Rancho Santa Margarita
City of Dana Point	City of San Clemente
City of Laguna Beach	City of San Juan Capistrano
City of Laguna Hills	City of Laguna Woods
City of Laguna Niguel	County of Orange
City of Lake Forest	Orange County Flood Control District
City of Mission Viejo	

After the San Diego Water Board receives and considers the Riverside County Copermittees' Report of Waste Discharge and makes any necessary changes to this Order, the Riverside County Copermittees in Table 1c will become subject to waste discharge requirements set forth in this Order after expiration of Order No. R9-2010-0016, NPDES No. CAS0108766 on or after November 10, 2015.

Table 1c. Riverside County Copermittees

City of Murrieta	County of Riverside
City of Temecula	Riverside County Flood Control and Water Conservation District
City of Wildomar	

The Orange County Copermittees and Riverside County Copermittees may become subject to the requirements of this Order at a date earlier than the expiration date of their current Orders subject to the conditions described in Provision F.6 of this Order if the Copermittees in the respective county receive a notification of coverage from the San Diego Water Board.

The term Copermittee in this Order refers to any San Diego County, Orange County, or Riverside County Copermittee covered under this Order, unless specified otherwise.

This Order provides permit coverage for the Copermittee discharges described in Table 2.

Table 2. Discharge Locations and Receiving Waters

Discharge Points	Locations throughout San Diego Region
Discharge Description	Municipal Separate Storm Sewer System (MS4) Discharges
Receiving Waters	Inland Surface Waters, Enclosed Bays and Estuaries, and Coastal Ocean Waters of the San Diego Region

Table 3. Administrative Information

This Order was adopted by the San Diego Water Board on:	**Month Day, 2013**
This Order will become effective on:	**Month Day, 2013**
This Order will expire on:	**Month Day, 2018**
The Copermittees must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than 180 days in advance of the Order expiration date.	

I, David W. Gibson, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on Month Day, 2013.

TENTATIVE

David W. Gibson
Executive Officer

TABLE OF CONTENTS

TABLE OF CONTENTS
(Cont'd)

I. FINDINGS

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), finds that:

JURISDICTION

1. **MS4 Ownership or Operation.** Each of the Copermittees owns or operates an MS4, through which it discharges storm water and non-storm water into waters of the U.S. within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the U.S.

2. **Legal and Regulatory Authority.** This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations (Code of Federal Regulations [CFR] Title 40, Part 122 [40 CFR 122]) adopted by the United States Environmental Protection Agency (USEPA), and chapter 5.5, division 7 of the California Water Code (CWC) (commencing with section 13370). This Order serves as an NPDES permit for discharges from MS4s to surface waters. This Order also serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the CWC (commencing with section 13260).

   The San Diego Water Board has the legal authority to issue a regional MS4 permit pursuant to its authority under CWA section 402(p)(3)(B) and 40 CFR 122.26(a)(1)(v). The USEPA also made it clear that the permitting authority, in this case the San Diego Water Board, has the flexibility to establish system- or region-wide permits (55 Federal Register [FR] 47990, 48039-48042). The regional nature of this Order will ensure consistency of regulation within watersheds and is expected to result in overall cost savings for the Copermittees and San Diego Water Board.

   The federal regulations make it clear that the Copermittees need only comply with permit conditions relating to discharges from the MS4s for which they are operators (40 CFR 122.26(a)(3)(vi)). This Order does not require the Copermittees to manage storm water outside of their jurisdictional boundaries, but rather to work collectively to improve storm water management within watersheds.

3. **CWA NPDES Permit Conditions.** Pursuant to CWA section 402(p)(3)(B), NPDES permits for storm water discharges from MS4s must include requirements to effectively prohibit non-storm water discharges into MS4s, and require controls to reduce the discharge of pollutants ~~in storm water~~ to the maximum extent practicable (MEP), and to require other provisions as the San Diego Water Board determines are appropriate to control such pollutants. This Order prescribes conditions to assure

compliance with the CWA requirements for owners and operators of MS4s to effectively prohibit non-storm water discharges in to the MS4s, and require controls to reduce the discharge of pollutants in storm water from the MS4s to the MEP.

4. **CWA and CWC Monitoring Requirements.** CWA section 308(a) and 40 CFR 122.41(h),(j)-(l) and 122.48 require that NPDES permits must specify monitoring and reporting requirements. Federal regulations applicable to large and medium MS4s also specify additional monitoring and reporting requirements in 40 CFR 122.26(d)(1)(iv)(D), 122.26(d)(1)(v)(B), 122.26(d)(2)(i)(F), 122.26(d)(2)(iii)(D), 122.26(d)(2)(iv)(B)(2) and 122.42(c). CWC section 13383 authorizes the San Diego Water Board to establish monitoring, inspection, entry, reporting and recordkeeping requirements. This Order establishes monitoring and reporting requirements to implement federal and State requirements.

5. **Total Maximum Daily Loads.** CWA section 303(d)(1)(A) requires that "[e]ach state shall identify those waters within its boundaries for which the effluent limitations…are not stringent enough to implement any water quality standard applicable to such waters." The CWA also requires states to establish a priority ranking of impaired water bodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired water bodies is called the Clean Water Act Section 303(d) List of Water Quality Limited Segments, commonly referred to as the 303(d) List. The CWA requires the 303(d) List to be updated every two years.

   TMDLs are numerical calculations of the maximum amount of a pollutant that a water body can assimilate and still meet water quality standards. A TMDL is the sum of the allowable loads of a single pollutant from all contributing point sources (waste load allocations or WLAs) and non-point sources (load allocations or LAs), background contribution, plus a margin of safety. Discharges from MS4s are point source discharges. The federal regulations (40 CFR 122.44(d)(1)(vii)(B)) require that NPDES permits to incorporate water quality based effluent limitations (WQBELs) developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, consistent with the assumptions and requirements of any available WLA for the discharge. Requirements of this Order implement the TMDLs adopted by the San Diego Water Board and approved by USEPA.

6. **Non-Storm Water Discharges.** Pursuant to CWA section 402(p)(3)(B)(ii), this Order requires each Copermittee to effectively prohibit discharges of non-storm water into its MS4. Nevertheless, non-storm water discharges into and from the MS4s continue to be reported to the San Diego Water Board by the Copermittees and other persons. Monitoring conducted by the Copermittees, as well as the 303(d) List, have identified dry weather, non-storm water discharges from the MS4s as a source of pollutants causing or contributing to receiving water quality impairments in the San Diego Region. The federal regulations (40 CFR 122.26(d)(2)(iv)(B)(1)) require the Copermittees to have a program to prevent illicit discharges to the MS4. The federal regulations, however, allow for specific categories of non-storm water discharges or flows to be addressed as illicit discharges only where such discharges

are identified as sources of pollutants to waters of the U.S.

7. **In-Stream Treatment Systems.** Pursuant to federal regulations (40 CFR 131.10(a)), in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Runoff treatment must occur prior to the discharge of runoff into receiving waters. Treatment control best management practices (BMPs) must not be constructed in waters of the U.S. Construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body.

DISCHARGE CHARACTERISTICS AND RUNOFF MANAGEMENT

8. **Point Source Discharges of Pollutants.** Discharges from the MS4s may contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s may contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the ~~Water Quality Control Plan for the San Diego Basin (~~Basin Plan~~). Storm water and non-storm water discharges from the MS4s are subject to the conditions and requirements established in the Basin Plan for point source discharges~~.

9. **Potential Beneficial Use Impairment.** The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses resulting in a condition of pollution, contamination, or nuisance.

10. **Pollutants Generated by Land Development.** Land development has created and continues to create new sources of non-storm water discharges and pollutants in storm water discharges as human population density increases. This brings higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, and trash. Pollutants from these sources are dumped or washed off the surface by non-storm water or storm water flows into and from the MS4s. When development converts natural vegetated pervious ground cover to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area without BMPs that can maintain pre-development conditions will contain greater pollutant loads and have significantly greater runoff volume, velocity, and peak flow rate than pre-development runoff from the same area.

11. **Runoff Discharges to Receiving Waters.** The MS4s discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within the eleven hydrologic units comprising the San Diego Region. Historic and current development makes use of natural drainage patterns and features as conveyances for runoff. ~~Rivers, streams and creeks in developed areas used in this manner are part of the Copermittees' MS4s regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the rivers, streams and creeks in the developed areas of the Copermittees' jurisdictions are both an MS4 and receiving water.~~ Numerous receiving water bodies and water body segments have been designated as impaired by the San Diego Water Board pursuant to CWA section 303(d).

12. **Pollutants in Runoff.** The most common pollutants in runoff discharged from the MS4s include total suspended solids, sediment, pathogens (e.g., bacteria, viruses, protozoa), heavy metals (e.g., cadmium, copper, lead, and zinc), petroleum products and polynuclear aromatic hydrocarbons, synthetic organics (e.g., pesticides, herbicides, and PCBs), nutrients (e.g., nitrogen and phosphorus), oxygen-demanding substances (e.g., decaying vegetation, animal waste), detergents, and trash. As operators of the MS4s, the Copermittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not effectively prohibit or otherwise control. These discharges may cause or contribute to a condition of pollution or a violation of water quality standards.

13. **Human Health and Aquatic Life Impairment.** Pollutants in runoff discharged from the MS4s can threaten and adversely affect human health and aquatic organisms. Adverse responses of organisms to chemicals or physical agents in runoff range from physiological responses such as impaired reproduction or growth anomalies to mortality. Increased volume, velocity, rate, and duration of storm water runoff greatly accelerate the erosion of downstream natural channels. This alters stream channels and habitats and can adversely affect aquatic and terrestrial organisms.

14. **Water Quality Effects.** The Copermittees' water quality monitoring data submitted to date documents persistent exceedances of Basin Plan water quality objectives for runoff-related pollutants at various watershed monitoring stations. Persistent toxicity has also been observed at several watershed monitoring stations. In addition, bioassessment data indicate that the majority of the monitored receiving waters have Poor to Very Poor Index of Biological Integrity (IBI) ratings. These findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in the San Diego Region. Non-storm water discharges from the MS4s have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds, and contribute significantly to exceedances of applicable receiving water quality objectives.

15. Non-Storm Water and Storm Water Discharges. ~~Non-storm water discharges from the MS4s are not considered storm water discharges and therefore are not subject to the MEP standard of CWA section 402(p)(3)(B)(iii), which is explicitly for "Municipal … *Stormwater Discharges* (emphasis added)" from the MS4s.~~ Pursuant to CWA 402(p)(3)(B)(ii), non-storm water discharges into the MS4s must be effectively prohibited. "Permits for discharges from municipal storm sewers… shall require controls to reduce the discharge of pollutants to the maximum extent practicable…" 402(p)(3)(B)(iii).

16. Best Management Practices. Waste and pollutants which are deposited and accumulate in MS4 drainage structures will be discharged from these structures to waters of the U.S. unless they are removed. These discharges may cause or contribute to, or threaten to cause or contribute to, a condition of pollution in receiving waters. For this reason, pollutants in storm water discharges from the MS4s can be and must be effectively reduced in runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and runoff, therefore keeping pollutants onsite and out of receiving waters. Treatment control BMPs remove pollutants that have been mobilized by storm water or non-storm water flows.

17. BMP Implementation. Runoff needs to be addressed during the three major phases of development (planning, construction, and use) in order to reduce the discharge of storm water pollutants to the MEP, effectively prohibit non-storm water discharges, and protect receiving waters. Development which is not guided by water quality planning policies and principles can result in increased pollutant load discharges, flow rates, and flow durations which can negatively affect receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development can generate substantial pollutant loads which are discharged in runoff to receiving waters. Retrofitting areas of existing development with storm water pollutant control and hydromodification management BMPs is necessary to address storm water discharges from existing development that may cause or contribute to a condition of pollution or a violation of water quality standards.

18. Long Term Planning and Implementation. Federal regulations require municipal storm water permits to expire 5 years from adoption, after which the permit must be renewed and reissued. The San Diego Water Board recognizes that the degradation of water quality and impacts to beneficial uses of the waters in the San Diego Region occurred over several decades. The San Diego Water Board further recognizes that a decade or more may be necessary to realize demonstrable improvement to the quality of waters in the Region. This Order includes a long term planning and implementation approach that will require more than a single permit term to complete.

WATER QUALITY STANDARDS

19. Basin Plan. The San Diego Water Board adopted the Water Quality Control Plan for the San Diego Basin (Basin Plan) on September 8, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for receiving waters addressed through the plan. The Basin Plan was subsequently approved by the State Water Resources Control Board (State Water Board) on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. Requirements of this Order implement the Basin Plan.

The Basin Plan identifies the following existing and potential beneficial uses for inland surface waters in the San Diego Region: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional existing and potential beneficial uses are identified for coastal waters of the San Diego Region: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

20. Ocean Plan. The State Water Board adopted the Water Quality Control Plan for Ocean Waters of California, California Ocean Plan (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005 and it became effective on February 14, 2006. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. Requirements of this Order implement the Ocean Plan.

The Ocean Plan identifies the following beneficial uses of ocean waters of the state to be protected: Industrial water supply; water contact and non-contact recreation, including aesthetic enjoyment; navigation; commercial and sport fishing; mariculture; preservation and enhancement of designated Areas of Special Biological Significance; rare and endangered species; marine habitat; fish spawning and shellfish harvesting

21. Sediment Quality Control Plan. On September 16, 2008, the State Water Board adopted the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality (Sediment Quality Control Plan). The Sediment Quality Control Plan became effective on August 25, 2009. The Sediment Quality Control Plan establishes: 1) narrative sediment quality objectives for benthic community protection from exposure to contaminants in sediment and to protect human health, and 2) a program of implementation using a multiple lines of evidence approach to interpret the narrative sediment quality objectives. Requirements of this Order implement the Sediment Quality Control Plan.

22. **National Toxics Rule and California Toxics Rule.** USEPA adopted the National Toxics Rule (NTR) on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the California Toxics Rule (CTR). The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.

23. **Antidegradation Policy.** This Order is in conformance with the federal Antidegradation Policy described in 40 CFR 131.12, and State Water Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*. Federal regulations at 40 CFR 131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. State Water Board Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. State Water Board Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies.

CONSIDERATIONS UNDER FEDERAL AND STATE LAW

24. **Coastal Zone Act Reauthorization Amendments.** Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point source pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point source pollution: agriculture, silviculture, urban, marinas, and hydromodification. This Order addresses the management measures required for the urban category, with the exception of septic systems. The runoff management programs developed pursuant to this Order fulfills the need for coastal cities to develop a runoff non-point source plan identified in the Non-Point Source Program Strategy and Implementation Plan. The San Diego Water Board addresses septic systems through the administration of other programs.

25. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the Federal Endangered Species Act (16 USC sections 1531 to 1544). This Order requires compliance with receiving water limits, and other requirements to protect the beneficial uses of

waters of the State. The Copermittees are responsible for meeting all requirements of the applicable Endangered Species Act.

26. **Report of Waste Discharge Process.** The waste discharge requirements set forth in this Order are based upon the Report of Waste Discharge submitted by the San Diego County Copermittees prior to the expiration of Order No. R9-2007-0001 (NPDES No. CAS0109266). The Orange County and Riverside County Copermittees are not immediately covered by the waste discharge requirements in this Order. The San Diego Water Board understands that each municipality is unique although the Counties share watersheds and geographical boundaries. The Order will continue to use the Report of Waste Discharge process prior to initially making Orange County or Riverside County Copermittees subject to the requirements of this Order.

    The federal regulations (40 CFR 122.21(d)(2)) and CWC section 13376 impose a duty on the Copermittees to reapply for continued coverage through submittal of a Report of Waste Discharge no later than 180 days prior to expiration of a currently effective permit. This requirement is set forth in the Orange County Copermittees' and Riverside County Copermittees' currently effective permits at Provisions K.2.b and K.2.c, respectively. The Orange County Permit, Order No. R9-2009-0002 (NPDES No. CAS0108740) expires on December 16, 2014 and the Riverside County MS4 Permit, Order No. R9-2010-0016 (NPDES No. CAS0108766) expires on November 10, 2015.

    Unless the Orange County or Riverside County Copermittees apply for and receive early coverage under this Order, the Orange County Copermittees' and the Riverside County Copermittees' respective permits will be superseded by this Order upon expiration of their respective permits, subject to any necessary revisions to the requirements of this Order made after the San Diego Water Board considers their respective Reports of Waste Discharge through the public process provided in 40 CFR 124.

27. **Integrated Report and Clean Water Act Section 303(d) List.** The San Diego Water Board and State Water Board submit an Integrated Report to USEPA to comply with the reporting requirements of CWA sections 303(d), 305(b) and 314, which lists the attainment status of water quality standards for water bodies in the San Diego Region. USEPA issued its *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* on July 29, 2005, which advocates the use of a five category approach for classifying the attainment status of water quality standards for water bodies in the Integrated Report. Water bodies included in Category 5 in the Integrated Report indicate at least one beneficial use is not being supported or is threatened, and a TMDL is required. Water bodies included in Category 5 in the Integrated Report are placed on the 303(d) List.

    Water bodies with available data and/or information that indicate at least one beneficial use is not being supported or is threatened, but a TMDL is not required, are included in Category 4 in the Integrated Report. Impaired surface water bodies may be included in Category 4 if a TMDL has been adopted and approved (Category 4a); if other pollution control requirements required by a local, state or federal authority are stringent enough to implement applicable water quality standards within a reasonable period of time (Category 4b); or, if the failure to meet an applicable water quality standard is not caused by a pollutant, but caused by other types of pollution (Category 4c).

Implementation of the requirements of this Order will~~may~~ allow the San Diego Water Board to include surface waters impaired by discharges from the Copermittees' MS4s in Category 4 in the Integrated Report for consideration during the next 303(d) List submittal by the State to USEPA.

28. Economic Considerations. The California Supreme Court has ruled that although CWC section 13263 requires the State and Regional Water Boards (collectively Water Boards) to consider factors set forth in CWC section 13241 when issuing an NPDES permit, the Water Board may not consider the factors to justify imposing pollutant restrictions that are less stringent than the applicable federal regulations require. (*City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 618, 626-627.) However, when pollutant restrictions in an NPDES permit are more stringent than federal law requires, CWC section 13263 requires that the Water Boards consider the factors described in CWC section 13241 as they apply to those specific restrictions.

As noted in the following finding, the San Diego Water Board finds that the requirements in this permit are not more stringent than the minimum federal requirements. Therefore, a CWC section 13241 analysis is not required for permit requirements that implement the effective prohibition on the discharge of non-storm water into the MS4 or for controls to reduce the discharge of pollutants in storm water to the MEP, or other provisions that the San Diego Water Board has determined appropriate to control such pollutants, as those requirements are mandated by federal law. Notwithstanding the above, the San Diego Water Board has developed an economic analysis of the requirements in this Order. The economic analysis is provided in the Fact Sheet.

~~**29. Unfunded Mandates.** This Order does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following:~~

~~**a.** This Order implements federally mandated requirements under CWA section 402 (33 USC section 1342(p)(3)(B)).~~

~~**b.** The local agency Copermittees' obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges.~~

~~**c.** The local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order.~~

~~**d.** The Copermittees have requested permit coverage in lieu of compliance with the~~

~~complete prohibition against the discharge of pollutants contained in CWA section 301(a) (33 USC section 1311(a)) and in lieu of numeric restrictions on their MS4 discharges (i.e. effluent limitations).~~

~~**e.** The local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIIIB, Section (6) of the California Constitution.~~

~~**f.** The provisions of this Order to implement TMDLs are federal mandates. The CWA requires TMDLs to be developed for water bodies that do not meet federal water quality standards (33 USC section 1313(d)). Once the USEPA or a state develops a TMDL, federal law requires that permits must contain water quality based effluent limitations consistent with the assumptions and requirements of any applicable wasteload allocation (40 CFR 122.44(d)(1)(vii)(B)).~~

~~See the Fact Sheet for further discussion of unfunded mandates.~~

~~30.~~29. California Environmental Quality Act. The issuance of waste discharge requirements and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with CWC section 13389.

STATE WATER BOARD DECISIONS

~~31.~~30. Compliance with Prohibitions and Limitations. The receiving water limitation language specified in this Order is consistent with language recommended by the USEPA and established in State Water Board Order WQ 99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Water Board on June 17, 1999. The receiving water limitation language in this Order requires storm water discharges from MS4s to not cause or contribute to a violation of water quality standards, which is to be achieved through an iterative approach requiring the implementation of improved and better-tailored BMPs over time. Implementation of the iterative approach to comply with receiving water limitations based on applicable water quality standards is necessary to ensure that storm water discharges from the MS4 will not ultimately cause or contribute to violations of water quality standards and will not create conditions of pollution, contamination, or nuisance.

~~32.~~31. Special Conditions for Areas of Special Biological Significance. On March 20, 2012, the State Water Board approved Resolution No. 2012-0012 approving an exception to the Ocean Plan effective prohibition against discharges to Areas of Special Biological Significance (ASBS) for certain nonpoint source discharges and NPDES permitted municipal storm water discharges. State Water Board Resolution No. 2012-0012 requires monitoring and testing of marine aquatic life and water quality in several ASBS to protect California's coastline during storms when rain water overflows into coastal waters. Specific terms, effective prohibitions, and special conditions were adopted to provide special protections for marine aquatic life and natural water quality in ASBS. The City of San Diego's municipal storm water discharges to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's municipal storm water discharges to the Heisler Park ASBS are subject terms and conditions of State Water Board Resolution No. 2012-0012. The Special Protections contained in Attachment B to Resolution No. 2012-0012, applicable to these discharges, are hereby incorporated into this Order as if fully set forth herein.

ADMINISTRATIVE FINDINGS

~~33.~~32. **Executive Officer Delegation of Authority.** The San Diego Water Board by prior resolution has delegated all matters that may legally be delegated to its Executive Officer to act on its behalf pursuant to CWC section 13223. Therefore, the Executive Officer is authorized to act on the San Diego Water Board's behalf on any matter within this Order unless such delegation is unlawful under CWC section 13223 or this Order explicitly states otherwise.

~~34.~~33. **Standard Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment B to this Order.

~~35.~~34. **Fact Sheet.** The Fact Sheet for this Order contains background information, regulatory and legal citations, references and additional explanatory information and data in support of the requirements of this Order. The Fact Sheet is hereby incorporated into this Order and constitutes part of the Findings of this Order.

~~36.~~35. **Public Notice.** In accordance with State and federal laws and regulations, the San Diego Water Board notified the Copermittees, and interested agencies and persons of its intent to prescribe waste discharge requirements for the control of discharges into and from the MS4s to waters of the U.S. and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet.

~~37.~~36. **Public Hearing.** The San Diego Water Board held a public hearing on Month Day, 2013 and heard and considered all comments pertaining to the terms and conditions of this Order. Details of the public hearing are provided in the Fact Sheet.

~~38.~~37. **Effective Date.** This Order serves as an NPDES permit pursuant to CWA section 401 or amendments thereto, and becomes effective fifty (50) days after the date of its adoption, provided that the Regional Administrator, USEPA, Region IX, does not object to this Order.

~~39.~~38. **Review by the State Water Board.** Any person aggrieved by this action of the San Diego Water Board may petition the State Water Board to review the action in accordance with CWC section 13320 and California Code of Regulations, title 23, sections 2050, et seq. The State Water Board must receive the petition by 5:00 p.m., 30 days after the San Diego Water Board action, except that if the thirtieth day following the action falls on a Saturday, Sunday or State holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at: http://www.waterboards.ca.gov/public_notices/petitions/water_quality or will be provided upon request.

THEREFORE, IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA and regulations adopted thereunder, must each comply with the following:

II. PROVISIONS

A. PROHIBITIONS AND LIMITATIONS

The purpose of this provision is to describe the conditions under which storm water and non-storm water discharges into and from MS4s are effectively prohibited or limited. The goal of the effective prohibitions and limitations is to protect the water quality and designated beneficial uses of waters of the ~~state~~ U.S. from adverse impacts caused or contributed to by MS4 discharges. This goal will be accomplished through the implementation of water quality improvement strategies and runoff management programs that effectively prohibit non-storm water discharges into the Copermittees' MS4s, and reduce pollutants in storm water discharges from the Copermittees' MS4s to the MEP. The process for determination of compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3) is defined in Provision A.4.

1. Discharge Prohibitions

a. Discharges from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance in receiving waters of the ~~state~~ U.S. are effectively prohibited, unless such discharges are addressed by the Copermittee through A.1.d, A.3.b or A.4.

b. Non-storm water discharges into MS4s are to be effectively prohibited, unless such discharges are either authorized by a separate NPDES permit, or the discharge is a category of non-storm water discharges or flows that must be addressed pursuant to Provisions E.2.a.(1)-(5) of this Order.

c. Discharges from MS4s are subject to all waste discharge prohibitions in the Basin Plan, included in Attachment A to this Order, unless such discharges are addressed by the Copermittee through A.1.d, A.3.b, or A.4.

d. Storm water discharges from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No. 2012-0012 applicable to these discharges, included in Attachment A to this Order. All other discharges from the Copermittees' MS4s to ASBS are prohibited.

2. Receiving Water Limitations

a. Discharges from MS4s must not cause or contribute to the violation of water quality standards in any receiving waters, ~~including but not limited to~~ set forth in all applicable provisions ~~contained in:~~ below, unless such discharges are addressed by the Copermittee through A.1.d, A.3.b, or A.4:

(1) The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;

(2) State Water Board plans for water quality control including the following:

(a) Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries (Thermal Plan), and

(b) The Ocean Plan, including beneficial uses, water quality objectives, and implementation plans;

(3) State Water Board policies for water and sediment quality control including the following:

(a) Water Quality Control Policy for the Enclosed Bays and Estuaries of California,

(b) Sediment Quality Control Plan which includes the following narrative objectives for bays and estuaries:

(i) Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities, and

(ii) Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health,

(c) The Statement of Policy with Respect to Maintaining High Quality of Waters in California;[1]

(4) Priority pollutant criteria promulgated by the USEPA through the following:

(a) National Toxics Rule (NTR)[2] (promulgated on December 22, 1992 and amended on May 4, 1995), and

(b) California Toxics Rule (CTR).[3,4]

---

[1] State Water Board Resolution No. 68-16
[2] 40 CFR 131.36
[3] 65 Federal Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR

b. Discharges from MS4s composed of storm water runoff must not alter natural ocean water quality in an ASBS.

[4] If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies.

3. Effluent Limitations

a. TECHNOLOGY BASED EFFLUENT LIMITATIONS

Pollutants in ~~storm water~~ discharges from MS4s must be reduced to the MEP.[5]

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

This Order establishes water quality based effluent limitations (WQBELs) consistent with the assumptions and requirements of all available TMDL waste load allocations (WLAs) assigned to discharges from the Copermittees' MS4s. Each Copermittee must comply with applicable WQBELs established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.

4. Compliance with Discharge Prohibitions and Receiving Water Limitations

Each Copermittee must achieve compliance with Provisions A.1.a, A.1.c and A.2.a of this Order through timely implementation of strategies, control measures and other actions as specified in Provisions B and E of this Order, including any modifications. The Water Quality Improvement Plans required under Provision B must be designed and adapted to ultimately achieve compliance with Provisions A.1.a, A.1.c and A.2.a, and may be used for compliance determination as described in Provision B.3.a.(3).

a. If exceedance(s) of water quality standards persist in receiving waters notwithstanding implementation of this Order, the Copermittees must comply with the following procedures:

(1) For exceedance(s) of a water quality standard in the process of being addressed by the Water Quality Improvement Plan, the Copermittee(s) must implement the Water Quality Improvement Plan as accepted by the San Diego Water Board, and update the Water Quality Improvement Plan, as necessary, pursuant to Provision F.2.c;

(2) Upon a determination by either the Copermittees or the San Diego Water Board that discharges from the MS4 are causing or contributing to ~~a new~~ persistent indications of an exceedance of an applicable water quality standard not addressed by the Water Quality Improvement Plan, the Copermittees must submit the following updates to the Water Quality Improvement Plan pursuant to Provision F.2.c or as part of the Annual Report

[5] This does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in ~~storm water~~ discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer). Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding 7.

required under Provision F.3.b, unless the San Diego Water Board directs an earlier submittal:

(a) The water quality improvement strategies being implemented that are effective and will continue to be implemented,

(b) Water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation or restoration projects, adjustments to jurisdictional runoff management programs, etc.) that will be implemented to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards,

(c) For Copermittees who are implementing the Water Quality Improvement Plan compliance option pursuant to Provision B.3.a.(3), the updated Water Quality Improvement Plan must provide reasonable assurance the updated strategies will address the new exceedance(s),

~~(c)~~(d) Updates to the schedule for implementation of the existing and additional water quality improvement strategies, and

~~(d)~~(e) Updates to the monitoring and assessment program to track progress toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a of this Order;

(3) The San Diego Water Board may require the incorporation of additional modifications to the Water Quality Improvement Plan required under Provision B. The applicable Copermittees must submit any modifications to the update to the Water Quality Improvement Plan within 90 days of notification that additional modifications are required by the San Diego Water Board, or as otherwise directed;

(4) Within 90 days of the San Diego Water Board determination that the update to the Water Quality Improvement Plan meets the requirements of this Order, the applicable Copermittees must revise the jurisdictional runoff management program documents to incorporate the updated water quality improvement strategies that have been and will be implemented, the implementation schedule, and any additional monitoring required; and

(5) Each Copermittee must implement the updated Water Quality Improvement Plan.

b. The procedure set forth above to achieve compliance with Provisions A.1.a, A.1.c and A.2.a of this Order do not have to be repeated for continuing or recurring exceedances of the same water quality standard(s) following implementation of scheduled actions unless directed to do otherwise by the San Diego Water Board.

~~c. Nothing in Provisions A.4.a and A.4.b prevents the San Diego Water Board from enforcing any provision of this Order while the applicable Copermittees prepare and implement the above update to the Water Quality Improvement Plan and jurisdictional runoff management programs.~~

B. WATER QUALITY IMPROVEMENT PLANS

The purpose of this provision is to develop Water Quality Improvement Plans that guide the Copermittees' jurisdictional runoff management programs towards achieving the outcome of improved water quality in MS4 discharges and receiving waters. The goal of the Water Quality Improvement Plans is to ~~protect, preserve, enhance~~1) effectively prohibit non-storm water discharges into the MS4s, 2) reduce pollutants in discharges from the MS4s to the MEP, and ~~restore the~~ 3) support the attainment and reasonable protection, preservation, and enhancement of water quality and designated beneficial uses of waters of the state. This goal will be accomplished through an adaptive planning and management process that identifies the highest priority water quality conditions within a watershed and implements strategies through the jurisdictional runoff management programs to achieve improvements in the quality of discharges from the MS4s and receiving waters. Therefore, implementation of the Water Quality Improvement Plans also provides the basis for complying with Provisions A.1, A.2 and A.3, as described in Provision B.3.a.(3).

1. Watershed Management Areas

The Copermittees must develop a Water Quality Improvement Plan for each of the Watershed Management Areas in Table B-1. A total of ten Water Quality Improvement Plans must be developed for the San Diego Region.

Development of the Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area shall commence upon notification of coverage of the Riverside County Copermittees under this Order. Until this time, the County of San Diego shall use the water quality priorities in the Santa Margarita River Watershed Urban Runoff Management Plan, developed pursuant to Order No. R9-2007-0001, to guide implementation of Provisions D and E within its jurisdiction.

Table B-1. Watershed Management Areas

Hydrologic Unit(s)	Watershed Management Area	Major Surface Water Bodies	Responsible Copermittees
San Juan (901.00)	South Orange County	- Aliso Creek - San Juan Creek - San Mateo Creek - Pacific Ocean - Heisler Park ASBS	- City of Aliso Viejo[1] - City of Dana Point[1] - City of Laguna Beach[1] - City of Laguna Hills[1] - City of Laguna Niguel[1] - City of Laguna Woods[1] - City of Lake Forest[1] - City of Mission Viejo[1] - City of Rancho Santa Margarita[1] - City of San Clemente[1] - City of San Juan Capistrano[1] - County of Orange[1] - Orange County Flood Control District[1]

Table B-1. Watershed Management Areas

Hydrologic Unit(s)	Watershed Management Area	Major Surface Water Bodies	Responsible Copermittees
Santa Margarita (902.00)	Santa Margarita River	- Murrieta Creek - Temecula Creek - Santa Margarita River - Santa Margarita Lagoon - Pacific Ocean	- City of Murrieta[2] - City of Temecula[2] - City of Wildomar[2] - County of Riverside[2] - County of San Diego[3] - Riverside County Flood Control and Water Conservation District[2]
San Luis Rey (903.00)	San Luis Rey River	- San Luis Rey River - San Luis Rey Estuary - Pacific Ocean	- City of Oceanside - City of Vista - County of San Diego

Notes:
1. The Orange County Copermittees will be covered under this Order after expiration of Order No. R9-2009-0002, or earlier if the Orange County Copermittees meet the conditions in Provision F.6.
2. The Riverside County Copermittees will be covered under this Order after expiration of Order No. R9-2010-0016, or earlier if the Riverside County Copermittees meet the conditions in Provision F.6.
3. The County of San Diego is required to implement the requirements of Provision B for its jurisdiction within the Santa

Margarita River Watershed Management Area until the Riverside County Copermittees have been notified of coverage under this Order.

2. Priority Water Quality Conditions

The Copermittees must identify the water quality priorities within each Watershed Management Area that will be addressed by the Water Quality Improvement Plan. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and jurisdictional runoff management program implementation efforts by receiving water.

a. Assessment of Receiving Water Conditions

The Copermittees must consider the following, at a minimum, to identify water quality priorities based on impacts of MS4 discharges on receiving water beneficial uses:

(1) Receiving waters listed as impaired on the CWA Section 303(d) List of Water Quality Limited Segments (303(d) List);

(2) TMDLs adopted and under development by the San Diego Water Board;

(3) Receiving waters recognized as sensitive or highly valued by the Copermittees, including estuaries designated under the National Estuary Program under CWA section 320, wetlands defined by the State or U.S. Fish and Wildlife Service's National Wetlands Inventory as wetlands, and receiving waters identified as ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (Attachment A);

(4) The receiving water limitations of Provision A.2;

(5) Known historical versus current physical, chemical, and biological water quality conditions;

(6) Available, relevant, and appropriately collected and analyzed physical, chemical, and biological receiving water monitoring data, including, but not limited to, data describing:

(a) Chemical constituents,

(b) Water quality parameters (i.e. pH, temperature, conductivity, etc.),

(c) Toxicity Identification Evaluations for both receiving water column and sediment,

(d) Trash impacts,

(e) Bioassessments, and

(f) Physical habitat;

(7) Available evidence of erosional impacts in receiving waters due to accelerated flows (i.e. hydromodification);

(8) Available evidence of adverse impacts to the chemical, physical, and biological integrity of receiving waters; and

(9) The potential improvements in the overall condition of the Watershed Management Area that can be achieved.

b. ASSESSMENT OF IMPACTS FROM MS4 DISCHARGES

The Copermittees must consider the following, at a minimum, to identify the potential impacts to receiving waters that may be caused or contributed to by discharges from the Copermittees' MS4s:

(1) The discharge prohibitions of Provision A.1 and effluent limitations of Provision A.3; and

(2) Available, relevant, and appropriately collected and analyzed storm water and non-storm water monitoring data from the Copermittees' MS4 outfalls;

(3) Locations of each Copermittee's MS4 outfalls that discharge to receiving waters;

(4) Locations of MS4 outfalls that are known to persistently discharge non-storm water to receiving waters likely causing or contributing to impacts on receiving water beneficial uses;

(5) Locations of MS4 outfalls that are known to discharge pollutants in storm water causing or contributing to impacts on receiving water beneficial uses; and

(6) The potential improvements in the quality of discharges from the MS4 that can be achieved.

c. IDENTIFICATION OF PRIORITY WATER QUALITY CONDITIONS

(1) The Copermittees must use the information gathered for Provisions B.2.a and B.2.b to develop a list of priority water quality conditions as pollutants, stressors and/or receiving water conditions that are the highest threat to receiving water quality or that most adversely affect the physical, chemical, and biological integrity of receiving waters. The list must include the following information for each priority water quality condition:

(a) The beneficial use(s) associated with the priority water quality condition;

(b) The geographic extent of the priority water quality condition within the Watershed Management Area, if known;

(c) The temporal extent of the priority water quality condition (e.g., dry weather and/or wet weather);

(d) The Copermittees with MS4s discharges that may cause or contribute to the priority water quality condition; and

(e) An assessment of the adequacy of and data gaps in the monitoring data to characterize the conditions causing or contributing to the priority water quality condition, including a consideration of spatial and temporal variation.

(2) The Copermittees must identify the highest priority water quality conditions to be addressed by the Water Quality Improvement Plan, and provide a rationale for selecting a subset of the water quality conditions identified pursuant to Provision B.2.c.(1) as the highest priorities.

d. IDENTIFICATION OF MS4 SOURCES OF POLLUTANTS AND/OR STRESSORS

The Copermittees must identify and prioritize known and suspected sources of storm water and non-storm water pollutants and/or other stressors associated with MS4 discharges that cause or contribute to the highest priority water quality conditions identified under Provision B.2.c. The identification of known and suspected sources of pollutants and/or stressors that cause or contribute to the highest priority water quality conditions as identified for Provision B.2.c must consider the following:

(1) Pollutant generating facilities, areas, and/or activities within the Watershed Management Area, including:

(a) Each Copermittee's inventory of construction sites, commercial facilities or areas, industrial facilities, municipal facilities, and residential areas,

(b) Publicly owned parks and/or recreational areas,

(c) Open space areas, and

(d) All currently operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste~~, and~~.

~~(e) Areas not within the Copermittees' jurisdictions (e.g., Phase II MS4s, tribal lands, state lands, federal lands) that are known or suspected to be discharging to the Copermittees' MS4s;~~

(2) Locations of the Copermittees' MS4s, including the following:

(a) All MS4 outfalls that discharge to receiving waters, and

(b) Locations of major structural controls for storm water and non-storm water (e.g., retention basins, detention basins, major infiltration devices, etc.);

~~(3) Other known and suspected sources of non-storm water or pollutants in storm water discharges to receiving waters within the Watershed Management Area, including the following:~~

~~(a) Other MS4 outfalls (e.g., Phase II Municipal and Caltrans),~~

~~(b) Other NPDES permitted discharges,~~

~~(c) Any other discharges that may be considered point sources (e.g., private outfalls), and~~

~~(d) Any other discharges that may be considered non-point sources (e.g., agriculture, wildlife or other natural sources);~~

~~(4)~~(3) Review of available data, including but not limited to:

(a) Findings from the Copermittees' illicit discharge detection and elimination programs,

(b) Findings from the Copermittees' MS4 outfall discharge monitoring,

(c) Findings from the Copermittees' receiving water monitoring,

(d) Findings from the Copermittees' MS4 outfall discharge and receiving water assessments, and

(e) Other available, relevant, and appropriately collected data, information, or studies related to pollutant sources and/or stressors that contribute to the highest priority water quality conditions as identified for Provision B.2.c.

~~(5)~~(4) The adequacy of the available data to identify and prioritize sources and/or stressors associated with MS4 discharges that cause or contribute to the highest priority water quality conditions identified under Provision B.2.c.

e. NUMERIC GOALS AND SCHEDULES

The Copermittees must develop and incorporate interim and final numeric goals[6] and schedules into the Water Quality Improvement Plan. Numeric goals must be used to support Water Quality Improvement Plan implementation and measure progress towards addressing the highest priority water quality conditions identified under Provision B.2.c. Numeric goals are not enforceable compliance standards, effluent limitations, or receiving water limitations. When establishing numeric goals and corresponding schedules, the Copermittees must consider the following:

(1) Final numeric goals must be based on measureable criteria or indicators, to be achieved in the receiving waters and/or MS4 discharges for the highest priority water quality conditions which will be capable of demonstrating the achievement of the restoration and/or protection of water quality standards in receiving waters;[7]

(2) Interim numeric goals must be based on measureable criteria or indicators capable of demonstrating incremental progress toward achieving the final numeric goals in the receiving waters and/or MS4 discharges; and

(3) Schedules must be adequate for measuring progress toward achieving the interim and final numeric goals required for Provisions B.2.e.(1) and B.2.e.(2). Schedules must incorporate the following:

(a) Interim dates for achieving the interim numeric goals,

(b) Compliance schedules for any applicable TMDLs in Attachment E to this Order,

(c) Compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A),

(d) Achievement of the final numeric goals in the receiving waters and/or MS4 discharges for the highest water quality priorities must be as soon as possible, and

[6] Interim and final numeric goals may take a variety of forms such as TMDL established WQBELs, action levels, pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric goals are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. Except for TMDL established WQBELs, interim and final numeric goals and corresponding schedules may be revised through the adaptive management process under Provision B.5.

[7] Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years.

(e) Final dates for achieving the final numeric goals must not initially extend more than 10 years beyond the effective date of this Order, unless a longer period of time is authorized by the San Diego Water Board Executive Officer or the schedule includes an applicable TMDL in Attachment E to this Order.

3. Water Quality Improvement Strategies and Schedules

The Copermittees must develop specific water quality improvement strategies to address the highest priority water quality conditions identified within a Watershed Management Area. The water quality improvement strategies must address the highest priority water quality conditions by ~~preventing or eliminating~~ effectively prohibiting non-storm water discharges to ~~and from~~ the MS4, reducing pollutants in ~~storm water~~ discharges from the MS4 to the MEP, and restoring and/or protecting the water quality standards of receiving waters.

a. Water Quality Improvement Strategies

The Copermittees must identify and prioritize water quality improvement strategies based on their likely effectiveness and efficiency, and implement strategies to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in ~~storm water~~ discharges from the MS4 to the MEP, improve the physical, chemical, and biological receiving water conditions, and achieve the interim and final numeric goals in accordance with the schedules required for Provision B.2.e.(3). The following water quality improvement strategies must be included and described in the Water Quality Improvement Plan:

(1) Specific strategies and/or activities that may be implemented by one or more Copermittees within their jurisdictions through the jurisdictional runoff management programs that will address the highest priority water quality conditions within the Watershed Management Area, in accordance with the following requirements:

(a) Strategies and/or activities must, at a minimum, be described for each jurisdictional runoff management program component where strategies to address the highest priority water quality conditions are required under Provision E;

(b) The Water Quality Improvement Plan must describe the circumstances or conditions when and where the strategies or/activities should be or will be implemented, but specific details about how each Copermittee will implement the strategies and/or activities within its jurisdiction are not required; and

(c) Descriptions of strategies and/or activities must include any monitoring, information collection, special studies, and/or data analysis that is necessary to assess the effectiveness of the strategy and/or activity toward addressing the highest priority water quality conditions.

(2) Additional strategies and/or activities that may be implemented within the Watershed Management Area on a jurisdictional, sub-watershed, or watershed scale by one or more Copermittees, not specifically required under Provision E, which are designed to achieve the interim and final numeric goals identified in Provisions B.2.e.(1) and B.2.e.(2);

(3) Copermittees may elect to develop their Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism for the discharge prohibitions (A.1), receiving water limitations (A.2), and effluent limitations (A.3). To utilize the Water Quality Improvement Plan-based compliance option, Permittees shall conduct a Reasonable Assurance Analysis. The objective of the Reasonable Assurance Analysis shall be to demonstrate the strategies and activities of the Water Quality Improvement Plan will ultimately result in attainment of the discharge prohibitions (A.1), receiving water limitations (A.2), and effluent limitations (A.3).

In order for a Copermittee to utilize the Water Quality Improvement Plan-based compliance option, the Regional Board Executive Officer must determine the following conditions are met:

(a) The Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board as described in Provision F.1.(a); AND

(b) The submitted Water Quality Improvement Plan includes a Reasonable Assurance Analysis that demonstrates that the strategies and activities in the Water Quality Improvement Plan will attain the applicable discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3); AND

(c) The submitted Water Quality Improvement Plan includes a schedule as outlined in Provision B.3.b that provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner.

If a Water Quality Improvement Plan-based compliance option is approved by the Regional Board Executive Officer, then in instances when the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) are not met, the implementation of the strategies and activities contained in the Water Quality Improvement Plan will be used for determination of compliance with Provision A. That is, any determination of a

Copermittee's compliance with Provision A shall be based on the following conditions:

(a) The strategies and activities of the Water Quality Improvement Plan are implemented per the approved schedule outlined pursuant to Provision B.3.b and adapted pursuant to Provisions B.5, F.1, and F.2; AND

(b) If exceedances persist notwithstanding implementations of the strategies and activities in the approved Water Quality Improvement Plan, then Responsible Copermittees revise the Water Quality Improvement Plan pursuant to Provision A.4.a, and implement the revised Water Quality Improvement Plan including additional or alternative activities per the schedule submitted with the revised Water Quality Improvement Plan.

For cases when applicable discharge prohibitions (A.1), receiving water limitations (A.2), or effluent limitations (A.3) are not attained during the time period between a Copermittee's notification of intent to utilize a Water Quality Improvement Plan-based compliance option, pursuant to Provision F.1.(a), and Regional Board Executive Officer approval of the submitted Water Quality Improvement Plan, determination of a Copermittee's compliance with Provision A shall be based on the following conditions:

(a) All deadlines for development of a Water Quality Improvement Plan pursuant to Provision F.1.(a) and (b) are met; AND

(b) The Water Quality Improvement Plan ultimately receives final approval.

b. IMPLEMENTATION SCHEDULES

(1) The Copermittees must develop schedules for implementing the water quality improvement strategies identified under Provision B.3.a to achieve the interim and final numeric goals identified under Provision B.2.e.(1) and B.2.e.(2). Schedules must be developed for both the water quality improvement strategies implemented by each Copermittee within its jurisdiction and for strategies that the Copermittees choose to implement on a collaborative basis.

(2) The Copermittees must incorporate the implementation compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A).

4. Water Quality Improvement Monitoring and Assessment Program

a. The Copermittees in each Watershed Management Area must develop and incorporate an integrated monitoring and assessment program into the Water Quality Improvement Plan that assesses: 1) the progress toward achieving the numeric goals and schedules, 2) the progress toward addressing the highest priority water quality conditions for each Watershed Management Area, and 3) each Copermittee's overall efforts to implement the Water Quality Improvement Plan.

b. The monitoring and assessment program must incorporate the monitoring and assessment requirements of Provision D, which may allow the Copermittees to modify the program to be consistent with and focus on the highest priority water quality conditions for each Watershed Management Area.

c. For Watershed Management Areas with applicable TMDLs, the monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E.

d. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A).

5. Iterative Approach and Adaptive Management Process

The Copermittees in each Watershed Management Area must implement the iterative approach pursuant to Provision A.4 to adapt the Water Quality Improvement Plan, monitoring and assessment program, and jurisdictional runoff management programs to become more effective toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a, and must include the following:

a. RE-EVALUATION OF PRIORITY WATER QUALITY CONDITIONS

The priority receiving water quality conditions, and numeric goals and corresponding schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.2.c and B.2.e, may be re-evaluated by the Copermittees as needed during the term of this Order as part of the Annual Report. Re-evaluation and recommendations for modifications to the priority water quality conditions, and numeric goals and corresponding schedules must be provided in the Report of Waste Discharge, and must consider the following:

(1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan;

(2) Progress toward achieving interim and final numeric goals in receiving waters and/or MS4 discharges for the highest priority water quality conditions in the

Watershed Management Area,

(3) Progress toward achieving outcomes according to established schedules;

(4) New information developed when the requirements of Provisions B.2.a-c have been re-evaluated;

(5) New policies or regulations that may affect identified numeric goals;

(6) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality conditions and implementation strategies to address the highest priority water quality conditions;

(7) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees;

(8) San Diego Water Board recommendations; and

(9) Recommendations for modifications solicited through a public participation process.

b. ADAPTATION OF STRATEGIES AND SCHEDULES

The water quality improvement strategies and schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.3, must be re-evaluated and adapted as new information becomes available to result in more effective and efficient measures to achieve the numeric goals established pursuant to Provision B.2.e. Re-evaluation of and modifications to the water quality improvement strategies must be provided in the Annual Report, and must consider the following:

(1) Modifications to the priority water quality conditions, and numeric goals and corresponding schedules based on Provision B.5.a;

(2) Measurable or demonstrable reductions of non-storm water discharges to ~~and from~~ each Copermittee's MS4;

(3) Measurable or demonstrable reductions of pollutants in ~~storm water~~ discharges from each Copermittee's MS4 to the MEP;

(4) New information developed when the requirements of Provisions B.2.b and B.2.d have been re-evaluated;

(5) Efficiency in implementing the Water Quality Improvement Plan;

(6) San Diego Water Board recommendations; and

(7) Recommendations for modifications solicited through a public participation process.

c. ADAPTATION OF MONITORING AND ASSESSMENT PROGRAM

The water quality improvement monitoring and assessment program, included in the Water Quality Improvement Plan pursuant to Provisions B.4, must be re-evaluated and adapted when new information becomes available. Re-evaluation and recommendations for modifications to the monitoring and assessment program, pursuant to the requirements of Provision D, may be provided in the Annual Report, but must be provided in the Report of Waste Discharge.

6. Water Quality Improvement Plan Submittal, Updates, and Implementation

a. The Copermittees must submit the Water Quality Improvement Plans in accordance with the requirements of Provision F.1.

b. The Copermittees must submit proposed updates to the Water Quality Improvement Plan for acceptance by the San Diego Water Board Executive Officer in accordance with the requirements of Provision F.2.c.

c. The Copermittees must commence with implementation of the Water Quality Improvement Plans immediately after acceptance by the San Diego Water Board, in accordance with the schedules, or subsequently updated schedules, within the Water Quality Improvement Plan.

C. ACTION LEVELS

The purpose of this provision is for the Copermittees to incorporate numeric action levels in the Water Quality Improvement Plans. The goal of the action levels is to guide Water Quality Improvement Plan implementation efforts and measure progress towards the protection of water quality and designated beneficial uses of waters of the state from adverse impacts caused or contributed to by MS4 discharges. This goal will be accomplished through monitoring and assessing the quality of the MS4 discharges during the implementation of the Water Quality Improvement Plans.

1. Non-Storm Water Action Levels[8]

The Copermittees must develop and incorporate numeric non-storm water action levels (NALs) into the Water Quality Improvement Plan to: 1) support the development and prioritization of water quality improvement strategies for addressing non-storm water discharges to and from the MS4s, 2) assess the effectiveness of the water quality improvement strategies toward addressing MS4 non-storm water discharges, required pursuant to Provision D.4.b.(1), and 3) support the detection and elimination of non-storm water and illicit discharges to and from the MS4, required pursuant to Provision E.2.[9]

a. The following NALs must be incorporated if the Copermittees do not establish numeric action levels within the Water Quality Improvement Plan based on watershed priorities:

(1) Non-Storm Water Discharges from MS4s to Ocean Surf Zone

Table C-1. Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000/1,000[1]	OP
Fecal Coliform	MPN/100 ml	200[2]	-	400	OP
Enterococci	MPN/100 ml	35	-	104[3]	OP

Abbreviations/Acronyms
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
MPN/100 ml – most probable number per 100 milliliters

Notes:
1. Total coliform density NAL is 1,000 MPN/100 ml when the fecal/total coliform ratio exceeds 0.1.
2. Fecal coliform density NAL is 200 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater “designated beach areas.”

[8] NALs are not considered ~~by the San Diego Water Board~~ to be enforceable limitations.
[9] The Copermittees may utilize NALs or other benchmarks currently established by the Copermittees as interim NALs until the Water Quality Improvement Plans are accepted by the San Diego Water Board Executive Officer.

(2) Non-Storm Water Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Table C-2. Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	-	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times			OP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	35	-	104[3]	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
BP – Basin Plan water quality objective
NTU – Nephelometric Turbidity Units
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas" and is not applicable to waterbodies that are not designated with the water contact recreation (REC-1) beneficial use.

Table C-3. Non-Storm Water Action Levels for Priority Pollutants

Parameter	Units	Freshwater (CTR)		Saltwater (CTR)	
		MDAL	AMAL	MDAL	AMAL
Cadmium	ug/L	**	**	16	8
Copper	ug/L	*	*	5.8	2.9
Chromium III	ug/L	**	**	-	-
Chromium VI	ug/L	16	8.1	83	41
Lead	ug/L	*	*	14	2.9
Nickel	ug/L	**	**	14	6.8
Silver	ug/L	*	*	2.2	1.1
Zinc	ug/L	*	*	95	47

Abbreviations/Acronyms:
CTR – California Toxic Rule
ug/L – micrograms per liter
AMAL – average monthly action level
MDAL – maximum daily action level

Notes:
* Action levels developed on a case-by-case basis (see below)
** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to ~~the following equations (~~40 CFR 131.38.b.2~~) will be required~~ for details:

~~Cadmium (Total Recoverable) = exp(0.7852[ln(hardness)] - 2.715)~~
~~Chromium III (Total Recoverable) = exp(0.8190[ln(hardness)] + 0.6848)~~
~~Copper (Total Recoverable) = exp(0.8545[ln(hardness)] - 1.702)~~
~~Lead (Total Recoverable) = exp(1.273[ln(hardness)] - 4.705)~~
~~Nickel (Total Recoverable) = exp(.8460[ln(hardness)] + 0.0584)~~
~~Silver (Total Recoverable) = exp(1.72[ln(hardness)] - 6.52)~~
~~Zinc (Total Recoverable) = exp(0.8473[ln(hardness)] + 0.884)~~

(3) Non-Storm Water Discharges from MS4s to Inland Surface Waters

Table C-4. Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters			BP
Turbidity	NTU	-	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times			BP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	33	-	61[3]	BP
Total Nitrogen	mg/L	-	1.0	See MDAL	BP
Total Phosphorus	mg/L	-	0.1	See MDAL	BP
MBAS	mg/L	-	0.5	See MDAL	BP
Iron	mg/L	-	0.3	See MDAL	BP
Manganese	mg/L	-	0.05	See MDAL	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
BP – Basin Plan water quality objective
COLD – cold freshwater habitat beneficial use
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
MDAL – maximum daily action level
WARM – warm freshwater habitat beneficial use
MBAS – Methylene Blue Active Substances
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for freshwater "designated beach areas" and is not applicable to waterbodies that are not designated with the water contact recreation (REC-1) beneficial use.

b. ~~If not identified in Provision C.1.a,~~ NALs must be identified, developed and incorporated in the Water Quality Improvement Plan for any pollutants or waste constituents that cause or contribute, or are threatening to cause or contribute to a condition of pollution or nuisance in waters of the state associated with the highest priority water quality conditions related to non-storm water discharges from the MS4s. NALs must be based on:

(1) Applicable water quality standards which may be dependent upon site-specific or receiving water-specific conditions or assumptions to be identified by the Copermittees; or

(2) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. For the NALs incorporated into the Water Quality Improvement Plan, the Copermittees may develop and incorporate secondary NALs specific to the Watershed Management Area at levels greater than the NALs required by Provisions C.1.a and C.1.b which can be utilized to further refine the prioritization and assessment of water quality improvement strategies for addressing non-storm water discharges to and from the MS4s, as well as the detection and elimination of non-storm water and illicit discharges to and from the MS4. The secondary NALs may be developed using an approach acceptable to the San Diego Water Board.

d. Dry weather monitoring data from MS4 outfalls collected in accordance with Provision D.2.b may be utilized to develop or revise NALs based on watershed-specific data, subject to San Diego Water Board Executive Officer approval.

2. Storm Water Action Levels[10]

The Copermittees must develop and incorporate numeric storm water action levels (SALs) in the Water Quality Improvement Plans to: 1) support the development and prioritization of water quality improvement strategies for reducing pollutants in storm water discharges from the MS4s, and 2) assess the effectiveness of the water quality improvement strategies toward reducing pollutants in storm water discharges, required pursuant to Provision D.4.b.(2).[11]

a. The following SALs for discharges of storm water from the MS4 must be incorporated if the Copermittees do not establish numeric action levels within the Water Quality Improvement Plan based on watershed priorities:

Table C-5. Storm Water Action Levels for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)*	µg/L	3.0
Copper (Total Cu)*	µg/L	127
Lead (Total Pb)*	µg/L	250
Zinc (Total Zn)*	µg/L	976

Abbreviations/Acronyms:
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
ug/L – micrograms per liter

Notes:
* The sampling must include a measure of receiving water hardness at each MS4 outfall. If a total metal concentration exceeds the corresponding metals SAL in Table C-5, that concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hour maximum concentration criterion for the measured level of hardness, then the sample result will not be considered above the SAL for that measurement.

b. ~~If not identified in Provision C.2.a,~~ SALs must be identified, developed and incorporated in the Water Quality Improvement Plan for pollutants or waste

[10] SALs are not considered ~~by the San Diego Water Board~~ to be enforceable limitations.
[11] The Copermittees may utilize SALs or other benchmarks currently established by the Copermittees as interim SALs until the Water Quality Improvement Plans are accepted by the San Diego Water Board Executive Officer.

constituents that cause or contribute, or are threatening to cause or contribute to a condition of pollution or nuisance in waters of the state associated with the highest water quality priorities related to storm water discharges from the MS4s. SALs must be based on:

(1) Federal and State water quality guidance and/or water quality standards; and

(2) Site-specific or receiving water-specific conditions; or

(3) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. For the SALs incorporated into the Water Quality Improvement Plan, the Copermittees may develop and incorporate secondary SALs specific to the Watershed Management Area at levels greater than the SALs required by Provisions C.2.a and C.2.b which can be utilized to further refine the prioritization and assessment of water quality improvement strategies for reducing pollutants in storm water discharges from the MS4s. The secondary SALs may be developed based on the approaches recommended by the State Water Board's Storm Water Panel[12] or using an approach acceptable to the San Diego Water Board.

d. Wet weather monitoring data from MS4 outfalls collected in accordance with Provision D.2.c may be used to develop or revise SALs based upon watershed-specific data, subject to San Diego Water Board Executive Officer approval.

[12] Storm Water Panel Recommendations to the California State Water Resources Control Board: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 2006)

D. MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS

The purpose of this provision is for the Copermittees to monitor and assess the impact on the chemical, physical, and biological conditions of receiving waters caused by discharges from the Copermittees' MS4s under wet weather and dry weather conditions. The goal of the monitoring and assessment program is to inform the Copermittees about the nexus between the health of receiving waters and the water quality condition of the discharges from their MS4s. This goal will be accomplished through monitoring and assessing the conditions of the receiving waters, discharges from the MS4s, pollutant sources and/or stressors, and effectiveness of the water quality improvement strategies implemented as part of the Water Quality Improvement Plans.

1. Receiving Water Monitoring Requirements

The Copermittees must develop and conduct a program to monitor the condition of the receiving waters in each Watershed Management Area during dry weather and wet weather. Following acceptance of the Water Quality Improvement Plans and schedule for implementation of monitoring for each Watershed Management Area, the Copermittees must conduct long-term receiving water monitoring during implementation of the Water Quality Improvement Plan to assess the long term trends and determine if conditions in receiving waters are improving. Any available monitoring data not collected specifically for this Order that meet the quality assurance criteria of the Copermittees and the monitoring requirements of this Order may be utilized by the Copermittees. The Copermittees must conduct the following receiving water monitoring procedures:

a. TRANSITIONAL RECEIVING WATER MONITORING

Until the monitoring requirements and implementation schedule for monitoring of Provisions D.1.b-e are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following receiving water monitoring in the Watershed Management Area:

(1) Continue the receiving water monitoring programs required in Order Nos. R9-2007-0001 (Attachment A, Section II. A. 1-5), R9-2009-0002, and R9-2010-0016;

(2) Continue the monitoring in the Hydromodification Management Plans approved by the San Diego Water Board;

(3) Participate in the following regional receiving water monitoring programs, as applicable to the Watershed Management Area:

(a) Storm Water Monitoring Coalition Regional Monitoring,

(b) Southern California Bight Regional Monitoring, and

(c) Sediment Quality Monitoring;

(4) Implement the monitoring programs developed as part of any implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) for the TMDLs in Attachment E to this Order; and

(5) For Watershed Management Areas with ASBS, implement the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012, included in Attachment A to this Order.

b. LONG-TERM RECEIVING WATER MONITORING STATIONS

The Copermittees must select at least one long-term receiving water monitoring station from among the existing mass loading stations, temporary watershed assessment stations, bioassessment stations, and stream assessment stations previously established by the Copermittees to be representative of the receiving water quality in the Watershed Management Area. Additional long-term receiving water monitoring stations must be selected where necessary to support the implementation and adaptation of the Water Quality Improvement Plan.

c. DRY WEATHER RECEIVING WATER MONITORING

During the term of the Order, the Copermittees must perform monitoring during at least three dry weather monitoring events at each of the long-term receiving water monitoring stations. At least one monitoring event must be conducted during the dry season (May 1 – September 30) and at least one monitoring event must be conducted during a dry weather period during the wet season (October 1 – April 30), after the first wet weather event of the season, with an antecedent dry period of at least 72 hours following a storm event producing measureable rainfall of greater than 0.1 inch.

(1) Dry Weather Receiving Water Field Observations

For each dry weather monitoring event, the Copermittees must record field observations consistent with Table D-1 at each long-term receiving water monitoring station.

Table D-1. Field Observations for Receiving Water Monitoring Stations

Field Observations

• Station identification and location
• Presence of flow, or pooled or ponded water
• If flow is present:
  - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate)
  - Flow characteristics (i.e. presence of floatables, surface scum, sheens, odor, color)
• If pooled or ponded water is present:
  - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, sheens, odor, color)
• Station description (i.e. deposits or stains, vegetation condition, structural condition, and observable biology)
• Presence and assessment of trash in and around station

(2) Dry Weather Receiving Water Field Monitoring

For each dry weather monitoring event, if conditions allow the collection of the data, the Copermittees must monitor and record the parameters in Table D-2 at each long-term receiving water monitoring station.

Table D-2. Field Monitoring Parameters for Receiving Water Monitoring Stations

Parameters
• pH • Temperature • Specific conductivity • Dissolved oxygen • Turbidity

(3) Dry Weather Receiving Water Analytical Monitoring

For each dry weather monitoring event, the Copermittees must collect and analyze samples from each long-term receiving water monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria;

(d) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over a typical 24-hour period, which may be collected through the use of automated equipment;

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,

(iv) Applicable NAL constituents, and

(v) Constituents listed in Table D-3.

Table D-3. Analytical Monitoring Constituents for Receiving Water Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Pesticides	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity • Total Hardness • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus • Orthophosphate • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia	• Arsenic • Cadmium • Chromium • Copper • Iron • Lead • Mercury • Nickel • Selenium • Thallium • Zinc	• Organophosphate Pesticides • Pyrethroid Pesticides	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(4) Dry Weather Receiving Water Toxicity Monitoring

For each dry weather monitoring event, the Copermittees must collect grab or composite samples from each long-term receiving water monitoring station to be analyzed for toxicity in accordance with Table D-4:

Table D-4. Dry Weather Toxicity Testing for Receiving Water Monitoring Stations

Freshwater Organism	Test Approach	USEPA Protocol[2]
Pimephales promelas	1 acute 1 chronic[1]	EPA-821-R-02-012
Hyalella Azteca	1 acute 1 chronic[1]	EPA-821-R-02-012
Psuedokirchneriella subcapitata	1 acute 1 chronic[1]	EPA-821-R-02-013

Notes:
1. Chronic toxicity testing is not required at receiving water monitoring stations located at mass loading stations if the channel flows are diverted year-round during dry weather conditions to the sanitary sewer for treatment.
2. USEPA protocols must be utilized for toxicity testing unless alternate toxicity testing protocols have been approved by the San Diego Water Board.

(5) Dry Weather Receiving Water Bioassessment Monitoring

Bioassessment monitoring for each long-term receiving water monitoring station is required at least once during the term of this Order. The Copermittees must conduct bioassessment monitoring during at least one dry weather monitoring event at each long-term receiving water monitoring station as follows:

(a) The following bioassessment samples and measurements must be collected:

(i) Macroinvertebrate samples must be collected in accordance with the "Reachwide Benthos (Multihabitat) Procedure" in the most current Surface Water Ambient Monitoring Program (SWAMP) Bioassessment Standard Operating Procedures (SOP), and amendments, as applicable;[13]

(ii) The "Full" suite of physical habitat characterization measurements must be collected in accordance with the most current SWAMP Bioassessment SOP, and as summarized in the SWAMP Stream Habitat Characterization Form – Full Version;[14] and

(iii) Freshwater algae samples must be collected in accordance with the SWAMP Standard Operating Procedures for Collecting Algae

[13] Ode, P.R.. 2007. Standard operating procedures for collecting macroinvertebrate samples and associated physical and chemical data for ambient bioassessments in California. California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP) Bioassessment SOP 001. http://www.swrcb.ca.gov/water_issues/programs/swamp/tools.shtml#monitoring
[14] Available at:
http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/fieldforms_fullversion052908.pdf

Samples.[15] Analysis of samples must include algal taxonomic composition (diatoms and soft algae) and algal biomass.

(b) The bioassessment samples, measurements, and appropriate water chemistry data must be used to calculate the following:

(i) An Index of Biological Integrity (IBI) for macroinvertebrates for each monitoring station where bioassessment monitoring was conducted, based on the most current calculation method;[16] and

(ii) An IBI for algae for each monitoring station where bioassessment monitoring was conducted, when a calculation method is developed.[17]

(c) In lieu of the requirements of Provision D.1.c.(5)(a), the Copermittees may conduct the bioassessment monitoring in accordance with the "Triad" assessment approach[18] to calculate the IBIs required for Provision D.1.c.(5)(b). The Copermittees must conduct sampling, analysis, and reporting of specified in-stream biological and habitat data according to the protocols specified in the SCCWRP Technical Report No. 539, or subsequent protocols, if developed.

(6) Dry Weather Receiving Water Hydromodification Monitoring

In addition to the hydromodification monitoring conducted as part of the Copermittees' Hydromodification Management Plans, hydromodification monitoring for each long-term receiving water monitoring station is required at least once during the term of this Order. The Copermittees must collect the following hydromodification monitoring observations and measurements within an appropriate domain of analysis during at least one dry weather monitoring event for each long-term receiving water monitoring station:

(a) Channel conditions, including:

(i) Channel dimensions,

[15] Fetscher et al. 2009. Standard Operating Procedures for Collecting Stream Algae Samples and Associated Physical Habitat and Chemical Data for Ambient Bioassessments in California.
[16] The most current calculation method at the time the Order was adopted is outlined in "A Quantitative Tool for Assessing the Integrity of Southern California Coastal Streams" (Ode, et al. 2005. Environmental Management. Vol. 35, No. 1, pp. 1-13). If an updated or new calculation method is developed, either both (i.e. current and updated/new) methods must be used, or historical IBIs must be recalculated with the updated or new calculation method.
[17] When a calculation method is developed, IBIs must be calculated for all available and appropriate historical data.
[18] Stormwater Monitoring Coalition Model Monitoring Technical Committee, 2004. Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California. Technical Report #419. August 2004.

(ii) Hydrologic and geomorphic conditions, and

(iii) Presence and condition of vegetation and habitat;

(b) Location of discharge points;

(c) Habitat integrity;

(d) Photo documentation of existing erosion and habitat impacts, with location (i.e. latitude and longitude coordinates) where photos were taken;

(e) Measurement or estimate of dimensions of any existing channel bed or bank eroded areas, including length, width, and depth of any incisions; and

(f) Known or suspected cause(s) of existing downstream erosion or habitat impact, including flow, soil, slope, and vegetation conditions, as well as upstream land uses and contributing new and existing development.

d. WET WEATHER RECEIVING WATER MONITORING

During the term of the Order, the Copermittees must perform monitoring during at least three wet weather monitoring events at each long-term receiving water monitoring station. At least one wet weather monitoring event must be conducted during the first wet weather event of the wet season (October 1 – April 30), and at least one wet weather monitoring event during a wet weather event that occurs after February 1.

(1) Wet Weather Receiving Water Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each long-term receiving water monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(b) The flow rates and volumes measured or estimated (data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(d) Presence and assessment of trash in and around station.

(2) Wet Weather Receiving Water Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each long-term receiving water monitoring station.

(3) Wet Weather Receiving Water Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each long-term receiving water monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria;

(d) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over the length of the storm event or a typical 24-hour period, which may be collected through the use of automated equipment;

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,

(iv) Applicable SAL constituents, and

(v) Constituents listed in Table D-3.

(4) Wet Weather Receiving Water Toxicity Monitoring

For each wet weather monitoring event, the Copermittees must collect grab or composite samples from each long-term receiving water monitoring station to be analyzed for toxicity in accordance with Table D-5:

Table D-5. Wet Weather Toxicity Testing for Receiving Water Monitoring Stations

Freshwater Organism	Test Approach	USEPA Protocol[1]
Pimephales promelas	1 acute	EPA-821-R-02-012
Hyalella Azteca	1 acute	EPA-821-R-02-012
Psuedokirchneriella subcapitata	1 acute	EPA-821-R-02-013

Notes:
1. USEPA protocols must be utilized for toxicity testing unless alternate toxicity testing protocols have been approved by the San Diego Water Board.

e. OTHER RECEIVING WATER MONITORING REQUIREMENTS

(1) Regional Monitoring

The Copermittees must participate in the following regional receiving waters monitoring programs, as applicable to the Watershed Management Area:

(a) Storm Water Monitoring Coalition Regional Monitoring; and

(b) Southern California Bight Regional Monitoring.

(2) Sediment Quality Monitoring

The Copermittees must perform sediment monitoring to assess compliance with sediment quality receiving water limits applicable to MS4 discharges to enclosed bays and estuaries. The monitoring may be performed either by individual or multiple Copermittees to assess compliance with receiving water limits, or through participation in a water body monitoring coalition. The Copermittees must identify sediment sampling stations that are spatially representative of the sediment within the water body segment or region of interest. Sediment quality monitoring must be conducted in conformance with the monitoring requirements set forth in the State Water Board Sediment Quality Control Plan.

(3) ASBS Monitoring

For Watershed Management Areas with ASBS, the Copermittees must implement the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012, included in Attachment A to this Order.

f. ALTERNATIVE WATERSHED MONITORING REQUIREMENTS

The San Diego Water Board may direct the Copermittees to participate in an effort to develop alternative watershed monitoring with other regulated entities, other interested parties, and the San Diego Water Board to refine, coordinate, and implement regional monitoring and assessment programs to determine the status and trends of water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams.

2. MS4 Outfall Discharge Monitoring Requirements

The Copermittees must develop and conduct a program to monitor the discharges from the MS4 outfalls in each Watershed Management Area during dry weather and wet weather. Following acceptance of the Water Quality Improvement Plans and schedule for implementation of monitoring for each Watershed Management Area, the Copermittees must conduct MS4 outfall discharge monitoring during implementation of the Water Quality Improvement Plan to assess the effectiveness of their jurisdictional runoff management programs toward effectively prohibiting non-storm water discharges and reducing pollutants in storm water discharges to and from their MS4s. Any available monitoring data not collected specifically for this Order that meet the quality assurance criteria of the Copermittees and the monitoring requirements of this Order may be utilized by the Copermittees. The Copermittees must conduct the following MS4 outfall monitoring procedures:

a. TRANSITIONAL MS4 OUTFALL DISCHARGE MONITORING

Until the monitoring requirements of Provisions D.2.b-c are incorporated into a Water Quality Improvement Plan and schedule for implementation of monitoring that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following MS4 outfall discharge monitoring in the Watershed Management Area:

(1) MS4 Outfall Discharge Monitoring Station Inventory

Each Copermittee must identify all major MS4 outfalls that discharge directly to receiving waters within its jurisdiction and geo-locate those outfalls on a map of the MS4 pursuant to Provision E.2.b.(1). This information must be compiled into a MS4 outfall discharge monitoring station inventory, and must include the following information:

(a) Latitude and longitude of MS4 outfall point of discharge;

(b) Watershed Management Area;

(c) Hydrologic subarea;

(d) Outlet size;

(e) Accessibility (i.e. safety and without disturbance of critical habitat);

(f) Approximate drainage area; and

(g) Classification of whether the MS4 outfall is known to have persistent dry weather flows, transient dry weather flows, no dry weather flows, or unknown dry weather flows.

(2) Transitional Dry Weather MS4 Outfall Discharge Field Screening Monitoring

Until the monitoring requirements and the monitoring implementation schedule described in ~~of~~ Provision D.2.b are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, each Copermittee must perform dry weather MS4 outfall field screening monitoring to identify non-storm water and illicit discharges within its jurisdiction in accordance with Provision E.2.c, to determine which discharges are transient flows and which are persistent flows, and prioritize the dry weather MS4 discharges that will be investigated and eliminated in accordance with Provision E.2.d. Each Copermittee must conduct the following dry weather MS4 outfall discharge field screening monitoring within its jurisdiction:

(a) Transitional Dry Weather MS4 Outfall Discharge Field Screening Monitoring Frequency

Each Copermittee must field screen the MS4 outfalls in its inventory developed pursuant to Provision D.2.a.(1) as follows:

(i) For Copermittees with less than 125 major MS4 outfalls that discharge to receiving waters within a Watershed Management Area, at least 80 percent of the outfalls must be visually inspected two times per year during dry weather conditions. For Copermittees with jurisdiction in more than one WMA, this requirement is limited to 500 inspections annually per Provision D.2.a.(2)(a)(iv).

(ii) For Copermittees with 125 major MS4 outfalls or more, but less than or equal to 500, that discharge to receiving waters within a Watershed Management Area all the outfalls must be visually inspected at least annually during dry weather conditions. For Copermittees with jurisdiction in more than one WMA, this requirement is limited to 500 inspections annually per Provision D.2.a.(2)(a)(iv).

(iii) For Copermittees with more than 500 major MS4 outfalls that discharge to receiving waters within a Watershed Management Area, at least 500 outfalls must be visually inspected at least annually during dry weather conditions. Copermittees with more than 500 major MS4 outfalls within a Watershed Management Area must identify and prioritize at least 500 outfalls to be inspected considering the following:

[a] Assessment of connectivity of the discharge to a flowing receiving water;
[b] Reported exceedances of NALs in water quality monitoring data;
[c] Surrounding land uses;
[d] Presence of constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List; and
[e] Flow rate.

For Copermittees with jurisdiction in more than one WMA, this requirement is limited to 500 inspections annually, per Provision D.2.a.(2)(a)(iv).

(iv) For Copermittees with more than 500 major MS4 outfalls within its jurisdiction that are located in more than one Watershed Management Area, at least 500 major MS4 outfalls within its inventory must be visually inspected at least annually during dry weather conditions. Copermittees with more than 500 major MS4 outfalls in more than one Watershed Management Area must identify and prioritize at least 500 outfalls to be inspected considering the following:

[a] Assessment of connectivity of the discharge to a flowing receiving water;
[b] Reported exceedances of NALs in water quality monitoring data;
[c] Surrounding land uses;
[d] Presence of constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List; and
[e] Flow rate.

(v) Inspections of major MS4 outfalls conducted in response to public reports and staff or contractor reports and notifications may count toward the required visual inspections of MS4 outfall discharge monitoring stations.

(b) Transitional Dry Weather MS4 Outfall Discharge Field Screening Visual Observations

(i) An antecedent dry period of at least 72 hours following any storm event producing measurable rainfall greater than 0.1 inch is required prior to conducting field screening visual observations during a field screening monitoring event.

(ii) During the field screening monitoring event, each Copermittee must record visual observations consistent with Table D-6 at each MS4 outfall discharge monitoring station inspected.

Table D-6. Field Screening Visual Observations for MS4 Outfall Discharge Monitoring Stations

Field Observations
• Station identification and location • Presence of flow, or pooled or ponded water • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate) - Flow characteristics (i.e. presence of floatables, surface scum, sheens, odor, color) - Flow source(s) suspected or identified from non-storm water source investigation - Flow source(s) eliminated during non-storm water source identification • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, sheens, odor, color) - Known or suspected source(s) of pooled or ponded water • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology) • Presence and assessment of trash in and around station • Evidence or signs of illicit connections or illegal dumping

(iii) Each Copermittee must implement the requirements of Provisions E.2.d.(2)(c)-(e) based on the field observations.

(iv) Each Copermittee must evaluate field observations together with existing information available from prior reports, inspections and monitoring results to determine whether any observed flowing, pooled, or ponded waters are likely to be transient or persistent flow.[19]

(c) Transitional Dry Weather MS4 Outfall Discharge Field Screening Monitoring Records

[19] Persistent flow is defined as the presence of flowing, pooled, or ponded water more than 72 hours after a measureable rainfall event of 0.1 inch or greater during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient.

Based upon the results of the transitional dry weather MS4 outfall discharge field screening monitoring conducted pursuant to Provisions D.2.a.(2)(a)-(b), each Copermittee must update its MS4 outfall discharge monitoring station inventory, compiled pursuant to Provision D.2.a.(1), with any new information on the classification of whether the MS4 outfall produces persistent flow, transient flow, or no dry weather flow.

(3) Transitional Wet Weather MS4 Outfall Discharge Monitoring

Until the monitoring requirements and the monitoring implementation schedule described in~~requirements of~~ Provision D.2.c are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following wet weather MS4 outfall discharge monitoring within the Watershed Management Area:

(a) Transitional Wet Weather MS4 Outfall Discharge Monitoring Stations

The Copermittees must select at least five wet weather MS4 outfall discharge monitoring stations from the inventories developed pursuant to Provision D.2.a.(1) that are representative of storm water discharges from areas consisting primarily of residential, commercial, industrial, and typical mixed-use land uses present within the Watershed Management Area.

The County of San Diego shall select at least two (2) transitional wet weather MS4 outfall discharge monitoring stations for the portion of the Santa Margarita River Watershed Management Area within its jurisdiction until the Riverside Copermittees are enrolled under this Order. After the Riverside Copermittees are enrolled, the Watershed Management Area Copermittees shall select at least five (5) transitional wet weather MS4 outfall discharge monitoring stations consistent with the requirements above.

(b) Transitional Wet Weather MS4 Outfall Discharge Monitoring Frequency

Each wet weather MS4 outfall discharge monitoring station selected pursuant to Provision D.2.a.(3)(a) must be monitored twice during the wet season (October 1 – April 30) in the transitional period. ~~One~~ The wet weather monitoring events shall be selected to be representative of the range of hydrological conditions experienced in the region. At least 10% of samples must be conducted during the first wet weather event of the wet season, to include at least one such sample in each Watershed Management Area~~and one wet weather monitoring event at least a month after the first wet weather event of the wet season~~.

(c) Transitional Wet Weather MS4 Outfall Discharge Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each wet weather MS4 outfall discharge monitoring station:

(i) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and

(ii) The flow rates and volumes measured or estimated (data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

(iii) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(iv) Presence and assessment of trash in and around station.

(d) Transitional Wet Weather MS4 Outfall Discharge Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each wet weather MS4 outfall discharge monitoring station.

(e) Transitional Wet Weather MS4 Outfall Discharge Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each wet weather MS4 outfall discharge monitoring station as follows:

(i) Analytes that are field measured are not required to be analyzed by a laboratory;

(ii) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(iii) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, and indicator bacteria;

(iv) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

[a] Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or
[b] Flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter, which may be collected through the use of automated equipment, or
[c] If automated compositing is not feasible, a composite sample may be collected using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours;

(v) Only one analysis of the composite of aliquots is required;

(vi) The samples must be analyzed for the following constituents:

[a] Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,
[b] Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order, and
[c] Constituents listed in ~~in~~ Table D-7.

Table D-7. Analytical Monitoring Constituents for Wet Weather MS4 Outfall Discharge Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity • Total Hardness • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus • Orthophosphate • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia	• Arsenic • Cadmium • Chromium • Copper • Iron • Lead • Nickel • Selenium • Thallium • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(f) Other Transitional Wet Weather MS4 Outfall Discharge Monitoring

The San Diego County Copermittees must continue the wet weather MS4 outfall monitoring program developed under Order No. R9-2007-0001, as approved by the San Diego Water Board, through its planned completion.

b. DRY WEATHER MS4 OUTFALL DISCHARGE MONITORING

Each Copermittee must perform dry weather MS4 outfall monitoring to identify non-storm water and illicit discharges within its jurisdiction pursuant to Provision E.2.c, and to prioritize the dry weather MS4 discharges that will be investigated and eliminated pursuant to Provision E.2.d. Each Copermittee must conduct the following dry weather MS4 outfall discharge monitoring within its jurisdiction:

(1) Dry Weather MS4 Outfall Discharge Field Screening Monitoring

Each Copermittee must continue to perform the dry weather MS4 outfall discharge field screening monitoring in accordance with the requirements of Provision D.2.a.(2). The Copermittee may adjust the field screening monitoring frequencies and locations for the MS4 outfalls in its inventory, as needed, to identify and eliminate sources of persistent flow non-storm water discharges in accordance with the highest priority water quality conditions identified in the Water Quality Improvement Plan, provided the number of visual inspections performed is equivalent to the number of visual inspections required under Provision D.2.a.(2)(a).

(2) Non-Storm Water Persistent Flow MS4 Outfall Discharge Monitoring

Each Copermittee must perform non-storm water persistent flow MS4 outfall discharge monitoring to determine which persistent non-storm water discharges contain concentrations of pollutants below NALs, and which persistent non-storm water discharges impact receiving water quality during dry weather. Each Copermittee must conduct the following non-storm water persistent flow MS4 outfall discharge monitoring within its jurisdiction:

(a) Prioritization of Non-Storm Water Persistent Flow MS4 Outfalls

Based upon the dry weather MS4 outfall discharge field screening monitoring records developed pursuant to Provision D.2.a.(2)(c), each Copermittee must identify and prioritize the MS4 outfalls with persistent flows based on the highest priority water quality conditions identified in the Water Quality Improvement Plan and any additional criteria developed by the Copermittee, which may include historical data and data from sources other than what the Copermittee collects.

(b) Non-Storm Water Persistent Flow MS4 Outfall Discharge Monitoring Frequency

(i) Based on the prioritization of major MS4 outfalls developed under Provision D.2.b.(2)(a), each Copermittee must identify, at a minimum, the ~~10~~ 5 highest priority major MS4 outfalls with non-storm water persistent flows that the Copermittee will monitor within each Watershed Management Area within its jurisdiction. If a Copermittee has less than 5 major outfalls within a WMA, the Copermittee shall monitor all of its major outfalls with persistent flows within that WMA. The location of the highest priority non-storm water persistent flow MS4 outfall monitoring stations must be identified on the map required pursuant to Provision E.2.b.(1).

(ii) Each of the highest priority non-storm water persistent flow MS4 outfall monitoring stations identified pursuant to Provision D.2.b.(2)(b)(i) must be monitored under dry weather conditions at least semi-annually until one of the following occurs:

[a] The non-storm water discharges have been effectively eliminated (i.e. no flowing, pooled, or ponded water) for three consecutive dry weather monitoring events; or

[b] The source(s) of the persistent flows has been identified as a category of non-storm water discharges that does not require an NPDES permit and does not have to be addressed as an illicit discharge because it was not identified as a source of pollutants (i.e. constituents in non-storm water discharge do not exceed

NALs), and the persistent flow can be re-prioritized to a lower priority; or

[c] The constituents in the persistent flow non-storm water discharge do not exceed NALs, and the persistent flow can be re-prioritized to a lower priority; or

[d] The source(s) of the persistent flows has been identified as a non-storm water discharge authorized by a separate NPDES permit.

(iii) Where the criteria under Provision D.2.b.(2)(c)(ii) are not met, but the threat to water quality has been reduced by the Copermittee, the highest priority persistent flow MS4 outfall monitoring stations may be reprioritized accordingly for continued dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.b.(1).

(iv) Each Copermittee must document removal or re-prioritization of the highest priority persistent flow MS4 outfall monitoring stations identified under Provision D.2.b.(2)(b) in the Annual Report. Persistent flow MS4 outfall monitoring stations that have been removed must be replaced with the next highest prioritized major MS4 ~~major~~ outfall in the Watershed Management Area within its jurisdiction, unless there are no remaining qualifying major MS4 outfalls within the Copermittee's jurisdiction in the Watershed Management Area.

(c) Non-Storm Water Persistent Flow MS4 Outfall Discharge Field Observations

During each semi-annual monitoring event, each Copermittee must record field observations consistent with Table D-6 at each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction.

(d) Non-Storm Water Persistent Flow MS4 Outfall Discharge Field Monitoring

During each semi-annual monitoring event, if conditions allow the collection of the data, each Copermittee must monitor and record the parameters in Table D-2 at each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction.

(e) Non-Storm Water Persistent Flow MS4 Outfall Discharge Analytical Monitoring

During each semi-annual monitoring event in which measurable flow is present, each Copermittee must collect and analyze samples from each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction as follows:

(i) Analytes that are field measured are not required to be analyzed by a laboratory;

(ii) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(iii) During development of the Water Quality Improvement Plan, for each WMA, consider the following sources to select constituents for ~~C~~collection of grab or composite samples to be analyzed at a qualified analytical laboratory~~for the following constituents~~:

[a] Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,
[b] Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,
[c] Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,
[d] Applicable NAL constituents, and
[e] Constituents listed in Table D-8~~, unless the~~

(iv) Copermittees may adjust the analytical list for a given WMA in successive monitoring events ~~Copermittee has~~ to add or eliminate constituents based on ~~historical~~ data that can demonstrate or provide justification ~~that~~ regarding the need or lack of need for analysis of ~~the~~ specific constituents~~ is not necessary~~.

Table D-8. Analytical Monitoring Constituents for Persistent Flow MS4 Outfall Discharge Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Total Hardness • Total Phosphorus • Orthophosphate • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia	• Cadmium • Copper • Lead • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(v) If the Copermittee identifies and eliminates the source of the persistent flow non-storm water discharge, analysis of the sample is not required.

c. WET WEATHER MS4 OUTFALL DISCHARGE MONITORING

The Copermittees must perform wet weather MS4 outfall monitoring to identify ~~sources of~~ pollutants in storm water discharges from the MS4s in the Watershed Management Area, and provide information to help guide source identification efforts. The Copermittees must conduct the following wet weather MS4 outfall discharge monitoring within the Watershed Management Area:

(1) Wet Weather MS4 Outfall Discharge Monitoring Stations

The Copermittees may adjust the wet weather MS4 outfall discharge monitoring locations and frequencies in the Watershed Management Area, as needed, to identify ~~sources of~~ pollutants in storm water discharges from MS4s in the Watershed Management Area in accordance with the highest priority water quality conditions identified in the Water Quality Improvement Plan, provided the number of stations is at least equivalent to the number of stations required under Provision D.2.a.(3)(a).

(2) Wet Weather MS4 Outfall Discharge Monitoring Frequency

The Copermittees must monitor the wet weather MS4 outfall discharge monitoring stations in the Watershed Management Area at an appropriate frequency to identify ~~sources of~~ pollutants in storm water discharges from the MS4s causing or contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan.

(3) Wet Weather MS4 Outfall Discharge Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each wet weather MS4 outfall discharge monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and

(b) The flow rates and volumes measured or estimated (data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(d) Presence and assessment of trash in and around station.

(4) Wet Weather MS4 Outfall Discharge Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each wet weather MS4 outfall discharge monitoring station.

(5) Wet Weather MS4 Outfall Discharge Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each wet weather MS4 outfall discharge monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria;

(d) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter, which may be collected through the use of automated equipment, or

(iii) If automated compositing is not feasible, a composite sample may be collected using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours.

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order, and

(iv) Applicable SAL constituents.

3. Special Studies

a. Within the term of this Order, the Copermittees must ~~develop and implement~~initiate the following special studies:

(1) At least two ~~three~~ special studies in each Watershed Management Area to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that cause or contribute to highest priority water quality conditions identified in the Water Quality Improvement Plan.

(2) At least one ~~two~~ special stud~~ies~~y for the San Diego Region to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that are impacting receiving waters on a regional basis in the San Diego Region.

(3) One of the two ~~three~~ special studies in each Watershed Management Area may be replaced by a special study implemented pursuant to Provision D.3.a.(2).

b. The special studies must, at a minimum, be in conformance with the following criteria:

(1) The special studies must be related to the highest priority water quality conditions identified by the Copermittees in the Watershed Management Area and/or for the entire San Diego Region;

(2) The special studies developed pursuant to Provision D.3.a.(1) must:

(a) Be implemented within the applicable Watershed Management Area, and

(b) Require some form of participation by all the Copermittees within the Watershed Management Area;

(3) The special studies developed pursuant to Provision D.3.a.(2) must:

(a) Be implemented within the San Diego Region, and

(b) Require some form of participation by all Copermittees covered under the requirements of this Order.

c. Special studies developed to identify sources of pollutants and/or stressors should be pollutant and/or stressor specific and based on historical monitoring data and monitoring performed pursuant to Provisions D.1 and D.2. Development of source identification special studies should include the following:

(1) A compilation of known information on the specific pollutant and/or stressor, including data on potential sources and movement of the pollutant and/or stressor within the watershed. Data generated by the Copermittees and others, as well as information available from a literature research on the pollutant and/or stressor should be compiled and analyzed as appropriate.

(2) An identification of data gaps, based on the compiled information generated on the specific pollutant and/or stressor in Provision D.3.d.(1). Source identification special studies should be developed to fill identified data gaps.

(3) A monitoring plan that will collect and provide data the Copermittees can utilize to do the following:

(a) Quantify the relative loading or impact of a pollutant and/or stressor from a particular source or pollutant generating activity;

(b) Improve understanding of the fate of a pollutant and/or stressor in the environment;

(c) Develop an inventory of known and suspected sources of a pollutant and/or stressor in the Watershed Management Area; and/or

(d) Prioritize known and suspected sources of a pollutant and/or stressor based on relative magnitude in discharges, geographical distribution (i.e., regional or localized), frequency of occurrence in discharges, human health risk, and controllability.

d. Special studies initiated prior to the ~~acceptance of the Water Quality Improvement Plan~~term of this Order that meet the requirements of Provision D.3.b and are ~~completed~~ implemented during the term of this Order may be utilized to fulfill the special study requirements of Provision D.3.a.

e. The Copermittees must submit the monitoring plans for the special studies in the Water Quality Improvement Plans required pursuant to Provision F.1.

f. The Copermittees are encouraged to share the results of the special studies regionally among the Copermittees to provide information useful in improving and adapting the management of non-storm water and storm water runoff through the implementation of the Water Quality Improvement Plans.

4. Assessment Requirements

Each Copermittee must evaluate the data collected pursuant to Provisions D.1, D.2 and D.3, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E, to assess the progress of the water quality improvement strategies in the Water Quality Improvement Plan toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a. Assessments must be performed as described in the following provisions:

a. RECEIVING WATERS ASSESSMENTS

(1) The Copermittees must assess and report the conditions of the receiving waters in the Watershed Management Area as follows:

(a) Based on data collected pursuant to Provision D.1.a, the assessments under Provision D.4.a.(2) must be included in the first Annual Report required pursuant to Provision F.3.b.(1).

(b) Based on the data collected pursuant to Provisions D.1.a-e, the assessments required under Provision D.4.a.(2) must be included in the Report of Waste Discharge required pursuant to Provision F.5.b.

(2) The Copermittees must assess the status and trends of receiving water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams under dry weather and wet weather conditions. For each of the three types of receiving waters in each Watershed Management Area the Copermittees must:

(a) Determine whether or not the conditions of the receiving waters are protective of the designated beneficial uses;

(b) Identify the most critical beneficial uses that must be protected or restored to ensure overall health of the receiving water;

(c) Determine whether or not those critical beneficial uses are being protected and where those beneficial used must be restored;

(d) Identify short-term and/or long-term improvements or degradation of those critical beneficial uses;

(e) Identify data gaps in the monitoring data necessary to assess Provisions D.4.a.(2)(a)-(d).

b. MS4 OUTFALL DISCHARGES ASSESSMENTS

(1) Non-Storm Water Discharges Reduction Assessments

(a) Each Copermittee must assess and report the progress of its illicit discharge detection and elimination program, required to be implemented pursuant to Provision E.2, toward reducing and effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction as follows:

(i) Based on data collected pursuant to Provisions D.2.a.(2), the assessments under Provision D.4.b.(1)(b) must be included in the first Annual Report required pursuant to Provision F.3.b.(1).

(ii) Based on the data collected pursuant to Provisions D.2.b, the assessments required under Provision D.4.b.(1)(c) must be included when complete in the first Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter.

(iii) Based on the data collected pursuant to Provisions D.2.b, the assessment required under Provision D.4.b.(1)(c) must be included in the Report of Waste Discharge required pursuant to F.5.b.

(b) Based on the transitional dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.a.(2), each Copermittee must assess and report the following:

(i) Identify the known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area;

(ii) Identify sources of transient and persistent flows within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and

(iii) Identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges pursuant to Provision D.2.b.(1).

(c) Based on the dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.b, each Copermittee must assess and report the following:

(i) The assessments required pursuant to Provision D.4.b.(1)(b);

(ii) Based on the data collected and applicable NALs in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations;

(iii) For the highest priority major MS4 outfalls with persistent flows that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances;

(iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually. ~~Each Copermittee must calculate or estimate:~~

[a] Each Copermittee must calculate or estimate: Annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction~~, with an estimate of the percent contribution from each known and suspected source for each MS4 outfall~~;

[b] Each Copermittee must ~~Annual non-storm water volumes and pollutant loads~~ identify and quantify, where feasible, sources of non-stormwater flows ~~from areas or facilities subject to~~ not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.

(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) ~~on an annual basis to~~ once per Permit term to:

[a] Identify reductions and progress in achieving reductions in non-storm water and illicit discharges to the Copermittee's MS4 in the Watershed Management Area;

[b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction, with an estimate, if possible, of the non-storm water volume and/or pollutant load reductions attributable to specific water quality strategies implemented by the Copermittee; and

[c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittee in the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction.

(vi) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(v).

(2) Storm Water Pollutant Discharges Reduction Assessments

(a) The Copermittees must assess and report the progress of the water quality improvement strategies, required to be implemented pursuant to Provisions B and E, toward reducing pollutants in storm water discharges from the MS4s within the Watershed Management Area as follows:

(i) Based on data collected pursuant to Provisions D.2.a.(3), the assessments under Provision D.4.b.(2)(b) must be included in the first Annual Report required pursuant to Provision F.3.b.(1).

(ii) Based on the data collected pursuant to Provisions D.2.c, the assessments required under Provisions D.4.b.(2)(c)(i) and (ii) must be included when complete in the ~~first~~ Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter.

(iii) Based on the data collected pursuant to Provisions D.2.c, the assessment required under Provisions D.4.b.(2)(c)-(d) must be included in the Report of Waste Discharge required pursuant to F.5.b.

(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following:

(i) ~~The Copermittees must a~~Analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate storm water volumes and pollutant loads discharged from the MS4s in each Copermittee's jurisdiction within the Watershed Management Area. The Copermittees must calculate or estimate the following for each monitoring year:

[a] The average storm water runoff coefficient for each land use type within the Watershed Management Area;

[b] The volume of storm water and pollutant loads discharged from each of the Copermittee's ~~major~~ monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch;

~~[c] The pollutant loads discharged from each of the Copermittee's major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; and~~

~~[d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within the drainage basin to each of the Copermittee's major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.~~

[c] The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored outfalls.

(ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify ~~sources~~ pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1).

(c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report the following:

(i) The assessments required pursuant to Provision D.4.b.(2)(b);

(ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed per Provision B.3, and evaluate whether those analyses and assumptions should be updated as a component of the adaptive management efforts under Provision B.5,~~rank the MS4 outfalls in the Watershed Management Area according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls~~ for follow-up action to update the Water Quality Improvement Plan;

(iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) ~~on an annual basis~~ once per Permit term to:

[a] Identify reductions and progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from the Copermittees' MS4s in the Watershed Management Area;

[b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters within the Watershed Management Area to the MEP, with an estimate, if possible, of the pollutant load reductions attributable to specific water quality strategies implemented by the Copermittees; and

[c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittees in the Watershed Management Area toward reducing pollutants in storm water discharges from the MS4s to receiving waters in the Watershed Management Area to the MEP.

(iv) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(iii).

(d) The Copermittees must evaluate all the data collected pursuant to Provision D.2.c, and incorporate new outfall monitoring data into time series plots for each long-term monitoring constituent for the Watershed Management Area, and perform statistical trends analysis on the cumulative long-term wet weather MS4 outfall discharge water quality data set.

c. SPECIAL STUDIES ASSESSMENTS

The Copermittees must annually evaluate the results and findings from the special studies developed and implemented pursuant to Provision D.3, and assess their relevance to the Copermittees' efforts to characterize receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters in the Watershed Management Area. The Copermittees must report the results of the special studies assessments applicable to the Watershed Management Area, and identify any necessary modifications or updates to the Water Quality Improvement Plan based on the results in the Annual Reports required pursuant to Provision F.3.b.

d. INTEGRATED ASSESSMENT OF WATER QUALITY IMPROVEMENT PLAN

As part of the iterative approach and adaptive management process required for the Water Quality Improvement Plan pursuant to Provision B.5, the Copermittees in each Watershed Management Area must integrate the data collected pursuant to Provisions D.1-D.3, the findings from the assessments required pursuant to Provisions D.4.a-c, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and identify necessary modifications to, the Water Quality Improvement Plan as follows:

(1) The Copermittees must re-evaluate the priority water quality conditions and numeric goals for the Watershed Management Area, as needed, during the term of this Order pursuant to Provision B.5.a. The re-evaluation and recommendations for modifications to the priority water quality conditions, and/or numeric goals and corresponding schedules may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. The priority water quality conditions and numeric goals for the Watershed Management Area must be re-evaluated as follows:

(a) Re-evaluate the receiving water conditions in the Watershed Management Area in accordance with Provision B.2.a;

(b) Re-evaluate the impacts on receiving waters in the Watershed Management Area from MS4 discharges in accordance with Provision B.2.b;

(c) Re-evaluate the identification of MS4 sources of pollutants and/or stressors in accordance with Provision B.2.d;

(d) Identify beneficial uses of the receiving waters that are protected or must be restored in accordance with Provision D.4.a;

(e) Evaluate the progress toward achieving the interim and final numeric goals for restoring impacted beneficial uses in the receiving waters.

(2) The Copermittees must re-evaluate the water quality improvement strategies for the Watershed Management Area during the term of this Order pursuant to Provision B.5.b. The re-evaluation and recommendations for modifications to the water quality improvement strategies and schedules must be provided in the ~~Annual Reports required pursuant to Provision F.3.b, and provided in the~~ Report of Waste Discharge pursuant to Provision F.5.b. The water quality improvement strategies for the Watershed Management Area must be re-evaluated as follows:

(a) Identify the non-storm water and storm water pollutant loads from the Copermittees’ MS4 outfalls in the Watershed Management Area, calculated or estimated pursuant to Provisions D.4.b;

(b) Identify the non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the interim and final numeric goals for restoring impacted beneficial uses in the receiving waters;

(c) Identify the non-storm water and storm water pollutant load reductions, or other improvements to the quality of MS4 discharges, that are necessary for the Copermittees to demonstrate that non-storm water and storm water discharges from their MS4s are not causing or contributing to exceedances of receiving water limitations;

(d) Evaluate the progress of the water quality improvement strategies toward achieving the interim and final numeric goals for restoring impacted beneficial uses in the receiving waters.

(3) The Copermittees must re-evaluate and adapt the water quality monitoring and assessment program for the Watershed Management Area when new information becomes available to improve the monitoring and assessment program pursuant to Provision B.5.c. The re-evaluation and recommendations for modifications to the monitoring and assessment program may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Report of Waste Discharge pursuant to Provision F.5.b. Modifications to the water quality monitoring and assessment program must be consistent with the requirements of Provision D.1-D.3. The re-evaluation of the water quality monitoring and assessment program for the Watershed Management Area must consider the data gaps identified by the assessments required pursuant to Provisions D.4.a-b, and results of the special studies implemented pursuant to Provision D.4.c.

5. Monitoring Provisions

Each Copermittee must comply with all the monitoring, reporting, and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

E. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS

The purpose of this provision is for each Copermittee to implement a program to control the contribution of pollutants to and the discharges from the MS4 within its jurisdiction. The goal of the jurisdictional runoff management programs is to implement strategies that effectively prohibit non-storm water discharges to the MS4 and reduce the discharge of pollutants from the MS4~~in storm water~~ to the MEP. This goal will be accomplished through implementing the jurisdictional runoff management programs in accordance with the strategies identified in the Water Quality Improvement Plans. For the Santa Margarita River Watershed Management Area, the County of San Diego shall use the water quality priorities in the Santa Margarita River Watershed Urban Runoff Management Plan (developed pursuant to Order No. R9-2007-0001) to guide jurisdictional runoff management program implementation until notified by the San Diego Water Board that the Water Quality Improvement Plan developed in conjunction with the Riverside Copermittees has been approved.

Each Copermittee must update its jurisdictional runoff management program document, in accordance with Provision F.2.a, to incorporate all the requirements of Provision E. Until the Copermittee has updated its jurisdictional runoff management program document with the requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.

Modification of Jurisdictional Runoff Management Program Requirements

Modifications shall be considered and where selected, proposed according to the process in Provision B.5. Proposed modifications may increase, decrease, and/or replace minimum requirements identified in Provision E.

1. Legal Authority Establishment and Enforcement

a. Each Copermittee must establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges ~~into and~~ from its MS4 through statute, ordinance, permit, contract, order, or similar means. This legal authority must, at a minimum, authorize the Copermittee to:

(1) Effectively ~~P~~prohibit and eliminate all illicit discharges and illicit connections to its MS4;

(2) Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4 and control the quality of runoff from industrial and construction sites that do not~~, including industrial and construction sites which~~ have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit)~~, as well as to those sites which do not~~;

(3) Control the discharge of spills, dumping, or disposal of materials other than storm water into its MS4;

~~(4)~~ Coordinate, as possible, with other agencies to minimize the contribution of pollutant discharges from the Copermittee's portion of the MS4 to portions of the MS4 under another agency's jurisdiction and from other agency's portions of the MS4 to the portion of the MS4 under the Copermittee's jurisdiction~~Control through interagency agreements among Copermittees the contribution of pollutants from one portion of the MS4 to another portion of the MS4;~~

~~Control, by coordinating and cooperating with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes through interagency agreements, where possible, the contribution of pollutants from their portion of the MS4 to the portion of the MS4 within the Copermittee's jurisdiction~~;

~~(5)~~(4) Require compliance with conditions in its statutes, ordinances, permits, contracts, orders, or similar means to hold dischargers to its MS4 accountable for their contributions of pollutants and flows;

~~(6)~~(5) Require the use of BMPs to prevent or reduce the discharge of pollutants in ~~storm water~~ from its MS4 to the MEP;

~~(7)~~(6) Require documentation on the effectiveness of BMPs implemented to prevent or reduce the discharge of pollutants ~~in storm water~~ from its MS4 to the MEP;

~~(8)~~(7) Utilize enforcement mechanisms to require compliance with its statutes, ordinances, permits, contracts, orders, or similar means; and

~~(9)~~(8) Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with its statutes, ordinances, permits, contracts, orders, or similar means and with the requirements of this Order, including the effective prohibition of illicit discharges and connections to its MS4; the Copermittee must also have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities, including construction sites, discharging into its MS4.

b. With the first Annual Report required pursuant to Provision F.3.b, each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in this Order.

2. Illicit Discharge Detection and Elimination

Each Copermittee must implement a program to actively detect and eliminate illicit discharges and improper disposal into the MS4, or otherwise require the discharger to apply for and obtain a separate NPDES permit. The illicit discharge detection and elimination program must be implemented in accordance with the strategies identified in the Water Quality Improvement Plan and include, at a minimum, the following requirements:

a. NON-STORM WATER DISCHARGES

To the extent allowable by law, ~~E~~each Copermittee must address all non-storm water discharges as illicit discharges, where the likelihood exists that they are a source of pollutants to waters of the U.S., unless a non-storm water discharge is either identified as a discharge authorized by a separate NPDES permit, or identified as a category of non-storm water discharges or flows that must be addressed pursuant to the following requirements:

(1) Discharges of non-storm water to the MS4 from uncontaminated pumped groundwater ~~the following categories~~ must be addressed as illicit discharges where there is evidence that suggests that they are the source of pollutants to waters of the U.S., unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay~~:~~.

~~(a) Uncontaminated pumped ground water;~~

~~(b) Discharges from foundation drains;[20]~~

~~(c) Water from crawl space pumps; and~~

~~(d) Water from footing drains.[19]~~

(2) Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under a valid NPDES Permit ~~No. CAG 679001 (Order No. R9-2010-0003~~, ~~(~~Order No. R9-2010-0003, or a subsequent order). This category includes water line flushing and water main break discharges from water purveyors under the Copermittee's jurisdiction that have been issued a water supply permit by the California Department of Public Health or

~~[20] Provision E.2.a.(1) only applies to this category on non-storm water if the system is designed to be located at or below the highest historical groundwater table to actively or passively extract groundwater during any part of the year.~~

federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit.

(3) Discharges of non-storm water to the MS4 from the following categories must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a source of pollutants to receiving waters:

(a) Diverted stream flows;

(b) Rising ground waters;

(c) Uncontaminated ground water infiltration to MS4s;

(d) Springs;

(e) Flows from riparian habitats and wetlands;

(f) Discharges from potable water sources;

(g) Discharges from foundation drains;~~[21]~~ ~~and~~

(h) Discharges from footing drains~~.~~; ~~[20]~~ and

~~(h)~~(i) Water from crawl space pumps.

(4) Discharges of non-storm water to the MS4 from the following categories must be controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means where the Copermittees or the San Diego Water Board identifies those discharges are a source of pollutants to waters of the U.S. Discharges of non-storm water to the MS4 from the following categories not controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means must be addressed by the Copermittee as illicit discharges.

(a) Air conditioning condensation

The discharge of air conditioning condensation ~~must~~ should be directed to landscaped areas, ~~or~~ other pervious surfaces where feasible, or to the sanitary sewer.

(b) Individual residential vehicle washing

~~[21] Provision E.2.a.(3) only applies to this category of non-storm water discharge if the system is designed to be located above the highest historical groundwater table at all times of the year, and the system is only expected to discharge non-storm water under unusual circumstances.~~

~~(i)~~ The discharge of wash water must be encouraged through public outreach and education;

(i) to be directed to landscaped areas or other pervious surfaces where feasible; and

(ii) to mMinimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible, wash vehicles at commercial wash facilities, and implement other practices or behaviors that will prevent the discharge of pollutants associated with individual residential vehicle washing from entering the MS4.

(c) Dechlorinated swimming pool discharges should be managed as to:

(i) Eliminate residual chlorine, algaecide, filter backwash, or other pollutants from swimming pools prior to discharging to the MS4; and

(ii) The discharge of saline swimming pool water must be directed to the sanitary sewer, landscaped areas, or other pervious surfaces that can accommodate the volume of water, unless the saline swimming pool water can be discharged via a pipe or concrete channel directly to a naturally saline water body (e.g. Pacific Ocean).

(5) Firefighting discharges to the MS4 must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a significant source of pollutants to receiving waters. Firefighting discharges to the MS4 not identified as a significant source of pollutants to receiving waters, must be addressed, at a minimum, as follows:

(a) Non-emergency firefighting discharges

(i) Building fire suppression system maintenance discharges (e.g., sprinkler line flushing) to the MS4 must be addressed as illicit discharges unless BMPs are implemented to prevent the discharge of pollutants to the MS4.

(ii) Non-emergency firefighting discharges (i.e., discharges from controlled or practice blazes, firefighting training, and maintenance activities not associated with building fire suppression systems) must be addressed by a program, to be developed and implemented by the Copermittee, to reduce or eliminate pollutants in such discharges from entering the MS4.

(b) Emergency firefighting discharges

Each Copermittee should develop and encourage implementation of BMPs to reduce or eliminate pollutants in emergency firefighting discharges to the MS4s and receiving waters within its jurisdiction. During emergency situations, priority of efforts should be directed toward life, property, and the environment (in descending order). BMPs should not interfere with immediate emergency response operations or impact public health and safety.

(6) If the Copermittee or San Diego Water Board identifies any category of non-storm water discharges listed under Provisions E.2.a.(1)-(4) as a source of pollutants to receiving waters, the category must be ~~prohibit~~effectively prohibited through ordinance, order, or similar means and addressed as an illicit discharge.

(7) Each Copermittee must, where feasible, reduce or effectively eliminate non-storm water discharges listed under Provisions E.2.a.(1)-(4) into its MS4 ~~whether or not the non-storm water discharge has been identified as an illicit discharge~~, unless a non-storm water discharge is identified as a discharge authorized by a separate NPDES permit.

b. PREVENT AND DETECT ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must include the following measures within its program to prevent and detect illicit discharges to the MS4:

(1) Each Copermittee must maintain an updated map of its entire MS4 and the corresponding drainage areas. The accuracy of the MS4 map must be confirmed during the field screening required pursuant to Provision E.2.c. The MS4 map must be included as part of the jurisdictional runoff management program document. Any geographic information system (GIS) layers or files used by the Copermittee to maintain the MS4 map must be made available to the San Diego Water Board upon request. The MS4 map must identify the following:

(a) All segments of the MS4 owned, operated, and maintained by the Copermittee;

(b) All known locations of inlets that discharge and/or collect runoff into the Copermittee's MS4;

(c) All known locations of connections with other MS4s not owned or operated by the Copermittee (e.g. Caltrans MS4s);

(d) All known locations of Major MS4 outfalls and private outfalls that discharge runoff collected from areas within the Copermittee's jurisdiction;

(e) All segments of receiving waters within the Copermittee's jurisdiction that receive and convey runoff discharged from the Copermittee's MS4 outfalls;

(f) Locations of the MS4 outfalls, identified pursuant to Provision D.2.a.(1), within its jurisdiction; and

(g) Locations of the non-storm water persistent flow MS4 outfall discharge monitoring stations, identified pursuant to Provision D.2.b.(2)(b), within its jurisdiction.

(2) Each Copermittee must use Copermittee personnel and contractors to assist in identifying and reporting illicit discharges and connections during their daily employment activities.

(3) Each Copermittee must promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges to or from the MS4, including the following methods for public reporting:

(a) Operate a public hotline, which can be Copermittee-specific or shared by the Copermittees, and must be capable of receiving reports in both English and Spanish 24 hours per day and seven days per week; and

(b) Designate an e-mail address for receiving electronic reports from the public, which can be Copermittee-specific or shared by the Copermittees, and must be prominently displayed on the Copermittee's webpage and the Regional Clearinghouse required pursuant to Provision F.4.

(4) Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills that may discharge into the MS4 within its jurisdiction from any source. The Copermittee must coordinate, to the extent possible, with spill response teams to prevent entry of spills into the MS4, and prevent contamination of surface waters of the U.S.~~water, ground water, and soil.~~ The Copermittee must coordinate spill prevention, containment, and response activities throughout all appropriate Copermittee departments, programs, and agencies.

(5) Each Copermittee must implement practices and procedures to prevent and limit infiltration of seepage from sanitary sewers (including private laterals and failing septic systems) to the MS4.

(6) Each Copermittee ~~must~~ shall coordinate, when necessary, with upstream Copermittees and/or entities to prevent illicit discharges from upstream sources into the MS4 within its jurisdiction.

c. FIELD SCREENING

Each Copermittee must conduct field screening (i.e. visual observations, field testing, and/or analytical testing) of MS4 outfalls and other portions of its MS4 within its jurisdiction to detect non-storm water and illicit discharges and connections to the MS4 in accordance with the dry weather MS4 outfall discharge monitoring requirements in Provisions D.2.a.(2) and D.2.b.(1).

d. INVESTIGATE AND ELIMINATE ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must include the following measures within its program to investigate and eliminate illicit discharges to the MS4:

(1) Each Copermittee must prioritize and determine when follow-up investigations will be performed in response to visual observations and/or water quality monitoring data collected during an investigation of a detected non-storm water or illicit discharge to or from the MS4. The criteria for prioritizing investigations must consider the following:

(a) Pollutants identified as causing or contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Pollutants identified as causing or contributing, or threatening to cause or contribute to impairments in water bodies on the 303(d) List and/or in environmentally sensitive areas (ESAs), located within its jurisdiction;

(c) Pollutants identified from sources or land uses known to exist within the area, drainage basin, or watershed that discharges to the portion of the MS4 within its jurisdiction included in the investigation;

(d) Pollutants identified as causing or contributing to an exceedance of a NAL in the Water Quality Improvement Plan where the source has not been identified as natural; and

(e) Pollutants identified as a threat to human health or the environment.

(2) Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that, based on reports or notifications, field screening, or other appropriate information, indicate a reasonable potential of ~~receiving, containing, or~~ discharging pollutants due to illicit discharges, illicit connections, or other sources of non-storm water. The procedures must include the following:

(a) Each Copermittee must develop criteria to:

(i) Assess the validity of each report or notification received; and

(ii) Prioritize the response to each report or notification received.

(b) Each Copermittee must prioritize and respond to each valid report or notification (e.g., public reports, staff or contractor reports and notifications, etc.) of an incident in a timely manner.

(c) In accordance with the procedures defined in Provision E.2.d.(1), ~~E~~each Copermittee must investigate and seek to identify the source(s) of discharges of non-storm water where flows are observed in and from the MS4 during the field screening required pursuant to Provision D.2.b.(1) as follows:

(i) Obvious illicit discharges (i.e., unusual color or odor) must be immediately investigated to identify the source(s) of non-storm water discharges;

(ii) The investigation must include field investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations; and

(iii) The investigation may include follow-up field investigations and/or reviewing Copermittee inventories and other land use data to identify potential sources of the discharge.

(d) Each Copermittee must maintain records and a database of the following information:

(i) Location of incident, including hydrologic subarea, portion of MS4 receiving the non-storm water or illicit discharge, and point of discharge or potential discharge from MS4 to receiving water;

(ii) Source of information initiating the investigation (e.g., public reports, staff or contractor reports and notifications, field screening, etc.);

(iii) Date the information used to initiate the investigation was received;

(iv) Date the investigation was initiated;

(v) Dates of follow-up investigations;

(vi) Identified or suspected source of the illicit discharge or connection, if determined;

(vii) Known or suspected related incidents, if any;

(viii) Result of the investigation; and

(ix) If a source cannot be identified and the investigation is not continued, document the response per the requirements of Provision E.2.d.(3) ~~a rationale for why a discharge does not pose a threat to water quality~~

~~and/or does not require additional investigation~~.

(e) Each Copermittee must ~~track~~ document and, if readily identifiable in accordance with Provision E.2.d.(1) procedures, seek to identify the source(s) of non-storm water discharges from the MS4 where there is evidence of non-storm water having been discharged into or from the MS4 (e.g., ~~pooled~~ flowing water), in accordance with MS4 outfall discharge monitoring requirements in Provisions D.2.a.(2) and D.2.b.

(3) Each Copermittee must initiate the implementation of procedures, in a timely manner, to eliminate all detected and identified illicit discharges and connections within its jurisdiction. The procedures must include the following responses:

(a) Each Copermittee must enforce its legal authority, as required under Provision E.1, to eliminate illicit discharges and connections to the MS4.

(b) If the Copermittee identifies the source as a controllable source of non-storm water or illicit discharge or connection, the Copermittee must implement its Enforcement Response Plan pursuant to Provision E.6 and enforce its legal authority to effectively prohibit and eliminate illicit discharges and connections to its MS4.

(c) If the Copermittee identifies the source of the discharge as a category of non-storm water discharges in Provision E.2.a, and the discharge is in exceedance of NALs in the Water Quality Improvement Plan, then the Copermittee must determine if: (1) this is an isolated incident or set of circumstances that will be addressed through its Enforcement Response Plan pursuant to Provision E.6, or (2) the category of discharge must be addressed through the effective prohibition of that category of discharge as an illicit discharge pursuant to Provision E.2.a.(6).

(d) If the Copermittee suspects the source of the non-storm water discharge as natural in origin (i.e. non-anthropogenically influenced) and in conveyance into the MS4, then the Copermittee must document and provide the data and evidence necessary to demonstrate to the San Diego Water Board that it is natural in origin and does not require further investigation.

(e) If the Copermittee is unable to identify and document the source of a recurring non-storm water discharge to or from the MS4, then the Copermittee must address the discharge as an illicit discharge and update its jurisdictional runoff management program to address the common and suspected sources of the non-storm water discharge within its jurisdiction in accordance with the Copermittee's priorities.

(4) Each Copermittee must submit a summary of the non-storm water discharges

and illicit discharges and connections investigated and eliminated within its jurisdiction with each Annual Report required under Provision F.3.b of this Order.

e. STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the illicit discharge detection and elimination program to address non-storm water and illicit discharges and connections that the Copermittee has identified as potential sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional BMPs, focus education, and/or increase/decrease frequency of inspections in specific areas); and

(2) The strategies and/or activities must be consistent with the requirements of Provisions E.2.a-d and the strategies identified in the Water Quality Improvement Plan.

3. Development Planning

Each Copermittee~~ ~~, within their respective jurisdictions and to the extent that they may lawfully impose requirements, must ~~use their land use and planning authorities to~~ implement a development planning program in accordance with the strategies identified in the Water Quality Improvement Plan and includes, at a minimum, the following requirements:

a. BMP REQUIREMENTS FOR ALL DEVELOPMENT PROJECTS

Each Copermittee, as practical and feasible, must prescribe the following BMP requirements during the planning process (i.e. prior to project approval and issuance of local permits) for all development projects (regardless of project type or size), where local permits are issued, including unpaved roads and flood management projects, except emergency projects implemented for the protection of persons and property:

(1) General Requirements

(a) Onsite BMPs must be located so as to remove pollutants from runoff prior to its discharge to any receiving waters, and as close to the source as possible; and

(b) Structural BMPs must not be constructed within a water~~s~~ of the U.S. unless authorized by the San Diego Water Board Executive Officer~~or~~

~~waters of the state~~.

(2) Source Control BMP Requirements

The following source control BMPs must be implemented at all development projects where applicable and feasible:

(a) Prevention of illicit discharges into the MS4;

(b) Storm drain system stenciling or signage;

(c) Properly designed outdoor material storage areas;

(d) Properly designed outdoor work areas;

(e) Properly designed trash storage areas; and

(f) Any additional BMPs necessary to minimize pollutant generation at each project.

(3) Low Impact Development (LID) BMP Requirements

The following LID BMPs must be implemented at all development projects where applicable and feasible:

(a) Maintenance or restoration of natural storage reservoirs and drainage corridors (including topographic depressions, areas of permeable soils, natural swales, and ephemeral and intermittent streams);[22]

(b) Buffer zones for natural water bodies (where buffer zones are technically infeasible, require project applicant to include other buffers such as trees, access restrictions, etc.);

(c) Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils;

(d) Construction of streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided public safety is not compromised;

(e) Minimization of the impervious footprint of the project;

(f) Minimization of soil compaction to landscaped areas;

[22] Development projects proposing to dredge or fill materials in waters of the U.S. must obtain a CWA Section 401 Water Quality Certification. Projects proposing to dredge or fill waters of the state must obtain waste discharge requirements.

(g) Disconnection of impervious surfaces through distributed pervious areas;

(h) Landscaped or other pervious areas designed and constructed to effectively receive and infiltrate, retain and/or treat runoff from impervious areas, prior to discharging to the MS4;

(i) Small collection strategies located at, or as close as possible to, the source (i.e. the point where storm water initially meets the ground) to minimize the transport of runoff and pollutants to the MS4 and receiving waters;

(j) Use of permeable materials for projects with low traffic areas and appropriate soil conditions;

(k) Landscaping with native or drought tolerant species; and

(l) Harvesting and using precipitation.

b. PRIORITY DEVELOPMENT PROJECTS

(1) Definition of Priority Development Project

Priority Development Projects include the following:

(a) All new development projects that fall under the Priority Development Project categories listed under Provision E.3.b.(2) (where a new development project feature, such as a parking lot, falls into a Priority Development Project category, the entire project footprint is subject to Priority Development Project requirements); and

(b) Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site, and the redevelopment project is a Priority Development Project category listed under Provision E.3.b.(2) (where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development and was not subject to previous Priority Project Development requirements, and the existing development was not subject to Priority Development Project requirements, the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) apply only to the addition or replacement, and not to the entire development; where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development, the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) apply to the entire development).

~~(b)~~(c) Projects where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development was subject to previous Priority Project Development Requirements, only the altered portion of development is subject to the new Priority Development Project requirements.

(2) Priority Development Project Categories

(a) New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This category includes commercial, industrial, residential, mixed-use, and public development projects on public or private land which fall under the planning and building authority of the Copermittee.

~~(b) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.~~

~~(c) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is 5,000 square feet or more.~~

~~(d) Hillside development projects. This category includes any development which creates 5,000 square feet or more of impervious surface which is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.~~

~~(e) Environmentally sensitive areas (ESAs). This category includes any development located within, directly adjacent to, or discharging directly to an ESA, which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. "Directly adjacent to" means situated within 200 feet of the ESA. "Discharging directly to" means outflow from a drainage conveyance system that collects runoff from the subject development or redevelopment site and terminates at or in receiving waters within the ESA.~~

~~(f) Parking lots. This category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce that has 5,000 square feet or more of impervious surface.~~

~~(g) Streets, roads, highways, freeways, and driveways. This category is defined as any paved impervious surface that is 5,000 square feet or more~~

~~used for the transportation of automobiles, trucks, motorcycles, and other vehicles.~~

~~(h) Retail gasoline outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.~~

(b) Development projects that create 5,000 square feet or more of impervious surfaces (collectively over the entire project site), and support one or more of the following uses (see Appendix C for definitions):

(i) Automotive repair shop

(ii) Restaurant

(iii) Parking lot

(iv) Street, road, highway, freeway and driveway

(v) Retail gasoline outlet (RGO)

~~(i)~~(c) Development projects that create 2,500 square feet or more of impervious surfaces (collectively over the entire project site) and where the project will directly discharge to an Environmentally Sensitive Area (see Appendix C for definitions).

~~(j)~~(d) Large development projects. This category includes any post-construction pollutant-generating new development projects that result in the disturbance of one acre or more of land.

(3) Priority Development Project Exemptions

Each Copermittee has the discretion to exempt the following projects from being defined as Priority Development Projects:

(a) New paved sidewalks, bicycle lanes, driveways, or trails that meet the following criteria:

(i) Designed and constructed to direct storm water runoff to adjacent vegetated areas, or other non-erodible permeable areas; OR

(ii) Designed and constructed to be hydraulically disconnected from paved streets or roads; OR

(iii) Designed and constructed with permeable pavements or surfaces in accordance with USEPA Green Streets guidance.[23]

[23] See "Managing Wet Weather with Green Infrastructure – Municipal Handbook: Green Streets" (USEPA, 2008).

(b) Any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles that follows the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets, or equivalent standards, to the maximum extent practicable.

~~(b) Retrofitting of existing paved alleys, streets or roads that meet the following criteria:~~

~~(i) Must be two lanes or less; AND~~

~~(ii) Must be a retrofitting project implemented as part of an alternative compliance project option under Provision E.3.c.(3)(b)(v) to achieve the performance requirements of Provisions E.3.c.(1) and/or E.3.c.(2) for a Priority Development Project; AND~~

~~(iii) Designed and constructed in accordance with the USEPA Green Streets guidance.~~[24]

(c) New single family residences that meet the following criteria:

(i) Must not be constructed as part of a larger development or proposed subdivision; AND

(ii) Designed and constructed to meet requirements for certification ~~to be certified~~ under the U.S. Green Building Council (USGCB) Leadership in Energy and Environmental Design (LEED) for Homes green building certification program, receiving at least four (4) Surface Water Management credits under the Sustainable Sites category~~;~~,[25] or other locally accepted certification of equivalent effectiveness; OR

(iii) Designed and constructed with ~~structural~~ BMPs that will achieve ~~the~~ equivalent performance to the requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite, OR

~~(iii)~~(iv) Designed and constructed with structural BMPs that meet minimum performance standards, as outlined in the BMP Design Manual.

(d) Redevelopment of existing single family residences that meet the following criteria:

(i) Designed and constructed to meet requirements for certification ~~to be certified~~ under the USGCB LEED for Homes green building certification program, receiving at least four (4) Surface Water

~~[24] Ibid.~~
[25] See LEED for Homes rating system at http://www.usgbc.org

Management credits under the Sustainable Sites category~~;~~,[26] or other locally accepted certification of equivalent effectiveness; OR

(ii) Designed and constructed with ~~structural~~ BMPs that will achieve ~~the~~ equivalent performance to the requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite; OR

(iii) Designed and constructed with structural BMPs that meet minimum performance standards, as outlined in the BMP Design Manual.

~~.~~

c. PRIORITY DEVELOPMENT PROJECT STRUCTURAL BMP PERFORMANCE REQUIREMENTS

In addition to the BMP requirements listed for all development projects under Provision E.3.a, Priority Development Projects must also implement structural BMPs that conform to performance requirements below. Alternatively, watershed-specific performance requirements may be developed as part of a Water Quality Improvement Plan; these requirements would replace the general performance requirements below. Watershed-specific requirements must provide at least equivalent protection as the general performance requirement below.

(1) Storm Water Pollutant Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement onsite structural BMPs to control pollutants in storm water that may be discharged from a project as follows:

(a) Each Priority Development Project must be required to implement LID BMPs that are designed to retain (i.e. intercept, store, infiltrate, evaporate, and evapotranspire) onsite the pollutants contained in the design capture volume. The design capture volume is equivalent to:

(i) The volume of storm water produced from a 24-hour 85th percentile storm event;[27] OR

(ii) The volume of storm water that would be retained onsite prior to the project~~if the site was fully undeveloped and naturally vegetated~~, as determined using continuous simulation modeling or other techniques based on site-specific soil conditions and ~~typical native~~ vegetative cover.

---

[26] See LEED for Homes rating system at http://www.usgbc.org

[27] This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals. The volume is a single event-based volume that occurs after an extended dry period.

(b) A Priority Development Project may be allowed to utilize alternative compliance under Provision E.3.c.(3) to comply with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1)(a).

(c) If a Priority Development project is allowed to utilize alternative compliance pursuant to Provisions E.3.c.(1)(b), flow-thru conventional treatment control BMPs must be implemented to treat the portion of the design capture volume that is not retained onsite. Additionally, project applicants must mitigate for the portion of the pollutant load in the design capture volume that is not retained onsite through one or more alternative compliance options under Provision E.3.c.(3). Conventional treatment control BMPs must be sized and designed to:

(i) Remove pollutants from storm water to the MEP;

(ii) Filter or treat either: 1) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event, or 2) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two;

(iii) Be ranked with high or medium pollutant removal efficiency for the Priority Development Project's most significant pollutants of concern. Conventional treatment control BMPs with a low removal efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted which exhibits that implementation of conventional treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.

(2) Hydromodification Management BMP Requirements

Each Copermittee must require each Priority Development Project to implement onsite structural BMPs to manage hydromodification that may be caused by storm water runoff discharged from a project as follows:

(a) Post-project runoff flow rates and durations must not exceed pre-project~~development (naturally occurring)~~ runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion, or degraded instream habitat conditions downstream of Priority Development Projects).

(i) In evaluating the range of flows that results in increased potential for erosion of natural (non-hardened) channels, the lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks.

~~(ii) For artificially hardened channels, analysis to identify the lower boundary must use characteristics of a natural stream segment similar to that found in the watershed. The lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or erodes the toe of the channel banks.~~

~~(iii)~~(ii) The Copermittees may use monitoring results collected pursuant to Provision D.1.a.(2) to re-define the range of flows resulting in increased potential for erosion, or degraded instream habitat conditions, as warranted by the data.

(b) In accordance with the BMP Design Manual, projects shall preserve or provide compensation for significant losses of sediment supply anticipated as a result of development. ~~Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project.~~

(c) A Priority Development Project may be allowed to utilize alternative compliance under Provision E.3.c.(3) to comply with the performance requirements of Provisions E.3.c.(2)(a)-(b).

(d) Exemptions

Each Copermittee has the discretion to exempt a Priority Development Project from the hydromodification management BMP performance requirements of Provisions E.3.c.(2)(a)-(b) where the project:

(i) Discharges storm water runoff into existing underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, tidally influenced waters, or the Pacific Ocean;

(ii) Discharges stormwater runoff into conveyance channels whose bed and bank are stabilized (e.g. concrete lined, an engineering interlocking paver, gabion system, etc.) all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, tidally influenced waters, or the Pacific Ocean;

~~(ii)~~(iii) Is a redevelopment Priority Development Project that meets the alternative compliance requirements of Provision E.3.c.(3)(b)(ii); or

~~(iii)~~(iv) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt, including those exemptions recognized in the 2010 San Diego Hydromodification Plan, approved by the San Diego Water Board Resolution No. R9-2010-0066, from the requirements of Provisions E.3.c.(2)(a)-(b).

(3) Alternative Compliance to Onsite Structural BMP Performance Requirements

Alternative compliance is an optional program for each jurisdiction to utilize if it is determined to provide an equivalent or greater benefit to the watershed than onsite compliance. Where alternative compliance is allowed, the determination of the responsible party to execute the onsite alternative compliance is at the jurisdiction's discretion and in accordance with policies set in place in the individual jurisdiction or in coordination with other jurisdictions, agencies, or Copermittees:

(a) Applicability

At the discretion of each Copermittee, Priority Development Projects may be allowed to utilize an alternative option to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) under the following conditions:

(i) The Copermittee must determine that implementation of the alternative compliance option will have an equal or greater overall water quality benefit for the Watershed Management Area than fully complying with the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite;

(ii) The alternative compliance options must be designed by a registered professional engineer, geologist, architect, biologist, hydrologist, or landscape architect, or other appropriate certified professional;

(iii) The alternative compliance options must be implemented within the same ~~hydrologic unit~~ Watershed Management Area as the Priority Development Project, and preferably within the same hydrologic subarea;

~~(iv) Receiving waters must not be utilized to convey storm water runoff to the alternative compliance options;~~

~~(v) The pollutants in storm water runoff from the Priority Development Project must be treated to the MEP by the alternative compliance options prior to being discharged to receiving waters;~~

~~(vi)~~(iv) Unless otherwise allowed by Provision E.3.c.(3)(b), the alternative compliance options must have a net result of at least the same level of pollutant removal as would have been achieved if the Priority Development Project had fully complied with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1) onsite;

~~(vii)~~(v) Unless otherwise allowed by Provision E.3.c.(3)(b), the alternative compliance options must have a net result of at least the same level of protection from potential downstream and upstream erosion in the receiving water as would have been achieved if the Priority

Development Project had fully complied with the hydromodification management BMP performance requirements of Provision E.3.c.(2) onsite; and

~~(viii)~~(vi) The alternative compliance options utilized by the Priority Development Project to comply with the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) must have reliable sources of funding for operation and maintenance.

(b) Alternative Compliance Project Options

The Copermittee may allow implementation of one or more of the following project options as part of an alternative approach to complying with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2):

(i) *Onsite LID Biofiltration Treatment Control BMPs*

The Copermittee may allow Priority Development Projects to utilize onsite LID biofiltration treatment control BMPs to comply with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1). Onsite LID biofiltration treatment control BMPs must be sized and designed to:

[a] Remove pollutants from storm water to the MEP; AND
[b] Have an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP; AND
[c] Biofilter at least 1.5 times the design capture volume that is not reliably retained onsite; OR
[d] Biofilter up to the design capture volume that is not reliably retained onsite, AND 1) treat the remaining portion of the design capture volume not retained onsite with conventional treatment control BMPs in accordance with Provision E.3.c.(1)(c), and 2) if necessary, mitigate for the portion of the pollutant load in the design capture volume not retained onsite through one or more alternative compliance project, in-lieu fee and/or water quality credit system options below.

(ii) *LEED Certified Redevelopment Projects*

The Copermittee may ~~allow~~ exempt redevelopment Priority Development Projects ~~to comply with~~ from the hydromodification management BMP performance requirements of Provision E.3.c.(2) where the project is designed and constructed to be certified under the USGCB LEED for New Construction and Major Renovations green building certification program or other locally accepted certification of equivalent effectiveness. The Priority Development Project must receive at least one (1) Site Design credit and two (2)

Stormwater Design credits under the Sustainable Sites category.[28] In addition, the existing and future configuration of the receiving water must not be unnaturally altered or adversely impacted by storm water flow rates and durations discharged from the site.

(iii) *Watershed-Based Planned Development Projects*

The Copermittee may allow Priority Development Projects greater than 100 acres in total project size (or smaller than 100 acres in size yet part of a larger common plan of development that is over 100 acres) to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) under~~. The Priority Development Project must comply with~~ the following conditions:

[a] The Priority Development Project was planned utilizing watershed and/or subwatershed based water quality, hydrologic, and fluvial geomorphologic planning principles that implement regional LID BMPs in accordance with the performance and location criteria of this Order and acceptable to the San Diego Water Board;
[b] Regional LID BMPs may be used provided that the BMPs capture and retain the volume of runoff produced from the design capture volume defined in Provision E.3.c.(1)(a)(i) and that such controls are located upstream of receiving waters;
[c] Regional LID BMPs must clearly exhibit that they will not result in a net impact from pollutant loadings over and above the impact caused by capture and retention of the design capture volume;
[d] Any portion of the design capture volume that is not retained by the regional LID BMPs must be treated using biofiltration BMPs; and
[e] Where regional LID BMPs are demonstrated to the Copermittee as technically infeasible to retain the entire design capture volume, any volume up to and including the design capture volume not retained by regional LID BMPs, nor treated by biofiltration BMPs, must be treated using conventional treatment control BMPs and the project applicant must implement additional alternative compliance project, in-lieu fee and/or water quality credit system options below.

(iv) *Offsite Regional BMPs*

[a] The Copermittee may allow Priority Development Projects to utilize offsite regional BMPs to comply with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1) if the offsite regional BMPs have the capacity to receive and retain at least 1.1 times the design capture volume that is not reliably retained onsite.

[28] See LEED for New Construction and Major Renovations rating system at http://www.usgbc.org

[b] The Copermittee may allow Priority Development Projects to utilize offsite regional BMPs to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) if the offsite regional BMPs ~~have the capacity to manage the storm water flows rates and durations from the site such that the receiving waters are protected from the potential for increased erosion that would be caused if the unmanaged portion of the runoff was discharged from the site~~will have a greater overall receiving water benefit within the Watershed Management Area than implementation of the hydromodification controls onsite.

(v) *Offsite Retrofitting Projects*

The Copermittee may allow Priority Development Projects to utilize offsite retrofitting projects to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the retrofitting projects have been identified within the strategies included in the Water Quality Improvement Plan, or identified as potential retrofitting projects by the Copermittee pursuant to Provision E.5.

(vi) *Offsite Channel, Stream, or Habitat Rehabilitation Projects*

The Copermittee may allow Priority Development Projects to utilize offsite channel, stream, or habitat rehabilitation projects to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) if the rehabilitation projects have been identified within the strategies included in the Water Quality Improvement Plan, or identified as potential channel rehabilitation projects by the Copermittee pursuant to Provision E.5. The channel, stream, or habitat rehabilitation project cannot be utilized for pollutant treatment ~~except~~ unless constructed with an artificial wetland.~~where artificial wetlands are constructed and located upstream of receiving waters~~.

(vii) *Offsite Regional Water Supply Augmentation Projects*

The Copermittee may allow Priority Development Projects to utilize offsite regional water supply augmentation projects (i.e. groundwater recharge, recycled water, storm water harvesting) to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the projects have been identified within the strategies included in the Water Quality Improvement Plan.

(viii) *Project Applicant Proposed Alternative Compliance Projects*

The Copermittee may allow one or more Priority Development Project applicant(s) to propose and implement alternative compliance projects to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the alternative compliance projects are consistent with, and will address the highest water quality priorities of the Water Quality Improvement Plan, and comply with the requirements of Provision E.3.c.(3)(a).

(c) Alternative Compliance In-Lieu Fee Option

The Copermittee may develop and implement an alternative compliance in-lieu fee option, individually or with other Copermittees and/or entities, as a means for designing, developing, constructing, operating and/or maintaining offsite alternative compliance projects under Provision E.3.c.(3)(b). Priority Development Projects allowed to utilize the alternative compliance in-lieu fee option must comply with the following conditions:

(i) The in-lieu fee must be transferred to the Copermittee (for public projects) or an escrow account (for private projects) prior to the construction initiation date ~~construction~~ of the Priority Development Project~~ is initiated~~.

(ii) If the in-lieu fee is applied to the development, design, ~~and~~ construction, operation and maintenance of offsite alternative compliance projects, the following conditions must be met:

[a] The offsite alternative compliance projects must allow the Priority Development Project to comply with the onsite BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2);

[b] The offsite alternative compliance projects must be constructed as soon as possible, but no later than ~~4~~ 8 years after the certificate of occupancy is granted for the first Priority Development Project that contributed funds toward the construction of the offsite alternative compliance projects, unless a longer period of time is authorized by the San Diego Water Board Executive Officer;

~~[c] The in-lieu fee for the Priority Development Project must include mitigation of the pollutant loads and increased storm water flow rates and durations that are allowed to discharge from the site before the offsite alternative compliance projects are constructed; and~~

[d] The in-lieu fee must ~~also~~ include the cost to operate and maintain the offsite alternative compliance projects for the anticipated life of the constructed priority development project.

(iii) If the in-lieu fee ~~is applied~~ applies only to the operation and maintenance of offsite alternative compliance projects that have already been constructed, the offsite alternative compliance projects must allow the Priority Development Project to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2).

(d) Alternative Compliance Water Quality Credit System Option

The Copermittee may develop and implement an alternative compliance water quality credit system option, individually or with other Copermittees and/or entities, provided that such a credit system clearly exhibits that it will not allow discharges from Priority Development Projects to cause or contribute to a net impact over and above the impact caused by projects meeting the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2). Any credit system that a Copermittee chooses to implement must be submitted to the San Diego Water Board Executive Officer for review and acceptance as part of the Water Quality Improvement Plan.

~~(3)~~(4) Long-Term Structural BMP Maintenance

Each Copermittee must require the project applicant to submit proof of the mechanism under which ongoing long-term maintenance of all structural BMPs will be conducted.

~~(4)~~(5) Infiltration and Groundwater Protection

(a) Structural BMPs designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins) must not cause or contribute to an exceedance of an applicable groundwater quality objective. At a minimum, such infiltration BMPs must be in conformance with the design criteria listed below, unless the development project applicant demonstrates to the Copermittee that one or more of the specific design criteria listed below are not necessary to protect groundwater quality. The design criteria listed below do not apply to small infiltration systems dispersed throughout a development project.

(i) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;

(ii) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration BMPs are to be used;

(iii) Infiltration BMPs must be adequately maintained to remove pollutants in storm water to the MEP;

(iv) The vertical distance from the base of any infiltration BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;

(v) The soil through which infiltration is to occur must have physical and chemical characteristics (e.g., appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses;

(vi) Infiltration BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless runoff does not exceed Basin Plan water quality standards or runoff is first treated or filtered to remove pollutants prior to infiltration; and

(vii) Infiltration BMPs must be located a minimum of 100 feet horizontally from any water supply wells.

(b) The Copermittee may develop, individually or with other Copermittees, alternative mandatory design criteria to that listed above for infiltration BMPs which are designed to primarily function as centralized infiltration devices. Before implementing the alternative design criteria in the development planning process the Copermittee(s) must:

(i) Notify the San Diego Water Board of the intent to implement the alternative design criteria submitted; and

(ii) Comply with any conditions set by the San Diego Water Board.

d. BMP DESIGN MANUAL UPDATE

Each Copermittee must update its BMP Design Manual[29] pursuant to Provision F.2.b. Until the Copermittee has updated its BMP Design Manual with the requirements of Provisions E.3.a-c, the Copermittee must continue implementing its current BMP Design Manual. Unless directed otherwise by the San Diego Water Board, the Copermittee must implement the BMP Design Manual within 180 days of completing the update. The update of the BMP Design Manual must include the following:

(1) Updated procedures to determine the nature and extent of storm water requirements applicable to a potential development or redevelopment projects. These procedures must inform project applicants of the storm water management requirements applicable to their project including, but not limited to, general requirements for all development projects, structural BMP design procedures and requirements, hydromodification management requirements, requirements specific to phased projects, and procedures specific to private

[29] The BMP Design Manual was formerly known as the Standard Storm Water Mitigation Plan under Order Nos. R9-2007-0001, R9-2009-0002, and R9-2010-0016.

developments and public improvement projects;

(2) Updated procedures to identify pollutants and conditions of concern for selecting the most appropriate structural BMPs that consider, at a minimum, the following:

(a) Receiving water quality (including pollutants for which receiving waters are listed as impaired under the CWA section 303(d) List);

(b) Pollutants, stressors, and/or receiving water conditions that cause or contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan;

(c) Land use type of the project and pollutants associated with that land use type; and

(d) Pollutants expected to be present onsite.

(3) Updated procedures for designing structural BMPs, including any updated performance requirements to be consistent with the requirements of Provision E.3.c for all structural BMPs listed in the BMP Design Manual;

(4) Long-term maintenance criteria for each structural BMP listed in the BMP Design Manual; and

(5) Alternative compliance criteria, in accordance with the requirements under Provision E.3.c.(3), if the Copermittee elects to allow Priority Development Projects within its jurisdiction to utilize alternative compliance.

e. PRIORITY DEVELOPMENT PROJECT BMP IMPLEMENTATION AND OVERSIGHT

Each Copermittee must implement a program that requires and confirms structural BMPs on all Priority Development Projects are designed, constructed, and maintained to remove pollutants in storm water to the MEP.

(1) Structural BMP Approval and Verification Process

(a) Each Copermittee must require and confirm that for all Priority Development Project applications that have not received prior lawful approval by the Copermittee by 18 months after the commencement of coverage under this Order, the requirements of Provision E.3 are implemented. For project applications that have received prior lawful approval by 18 months after the commencement of coverage under this Order, the Copermittee may allow previous land development requirements to apply.

(b) Each Copermittee must identify the roles and responsibilities of various municipal departments in implementing the structural BMP requirements, including each stage of a project from application review and approval through BMP maintenance and inspections.

(c) Each Copermittee must require and confirm that appropriate easements and ownerships are properly recorded in public records~~ and the information is conveyed to all appropriate parties when there is a change in project or site ownership~~.

(d) Each Copermittee must require and confirm that prior to occupancy and/or intended use of any portion of the Priority Development Project, each structural BMP is inspected to verify that it has been constructed and is operating in compliance with all of its specifications, plans, permits, ordinances, and the requirements of this Order.

(2) Priority Development Project Inventory and Prioritization

(a) Each Copermittee must develop, maintain, and update ~~ at least annually~~regularly, a watershed-based database to track and inventory all Priority Development Projects and associated structural BMPs within its jurisdiction. Inventories must be accurate and complete beginning from January 2002 for the San Diego County Copermittees, February 2003 for the Orange County Copermittees, and July 2005 for the Riverside County Copermittees, where data is available. The use of an automated database system, such as GIS, is highly recommended. The database must include, at a minimum, the following information:

(i) Priority Development Project location (address and hydrologic subarea);

(ii) Descriptions of structural BMP type(s);

(iii) Date(s) of construction;

(iv) Party responsible for structural BMP maintenance;

(v) Dates and findings of structural BMP maintenance verifications; and

(vi) Corrective actions and/or resolutions when applicable.

(b) Each Copermittee must prioritize the Priority Development Projects with structural BMPs within its jurisdiction. The designation of Priority Development Projects as high priority must consider the following:

(i) The highest water quality priorities identified in the Water Quality Improvement Plan;

(ii) Receiving water quality;

(iii) Number and sizes of structural BMPs;

(iv) Recommended maintenance frequency of structural BMPs;

(v) Likelihood of operation and maintenance issues of structural BMPs;

(vi) Land use and expected pollutants generated; and

(vii) Compliance record.

(3) Structural BMP Maintenance Verifications and Inspections

Each Copermittee is required to verify that structural BMPs on each Priority Development Project are adequately maintained, and continue to operate effectively to remove pollutants in storm water to the MEP through inspections, self-certifications, surveys, or other equally effective approaches.

(a) All (100 percent) of the structural BMPs at Priority Development Projects that are designated as high priority must be inspected directly by the Copermittee annually prior to each rainy season;

(b) For verifications performed through a means other than direct Copermittee inspection, adequate documentation must be required by the Copermittee to provide assurance that the required maintenance of structural BMPs at each Priority Development Project has been completed; and

(c) Appropriate follow-up measures (including re-inspections, enforcement, etc.) must be conducted to ensure that structural BMPs at each Priority Development Project continue to reduce pollutants in storm water to the MEP as originally designed.

f. DEVELOPMENT PROJECT ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all development projects, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

g. STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the development planning program to address development and redevelopment projects that may become sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional BMPs, focus education, increase frequency of verifications and/or inspections, alternative compliance options);

(2) Each Copermittee must identify areas within its jurisdiction where Priority

Development Projects may be allowed or should be encouraged to implement or contribute toward the implementation of alternative compliance retrofitting and/or stream, channel, or habitat rehabilitation projects;

(3) Each Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify regional alternative compliance projects that Priority Development Projects may be allowed or should be encouraged to implement or participate in implementing; and

(4) The strategies and/or activities must be consistent with the requirements of Provisions E.3.a-c and E.3.e-f and the strategies identified in the Water Quality Improvement Plan.

4. Construction Management

Each Copermittee must implement a construction management program in accordance with the strategies identified in the Water Quality Improvement Plan and includes, at a minimum, the following requirements:

a. Construction Program Management

Each Copermittee must define in the Jurisdictional Runoff Management Plan the following:

(1) Define construction sites to be inventoried, such as sites that involve any ground disturbance or soil disturbing activities.

(2) Define a process for confirming adequate construction BMP implementation for non-inventoried sites. Non-inventoried sites involve minor construction activities that are not anticipated to create storm water pollution such as interior improvements, plumbing, electrical and mechanical work.

~~a.~~ b. Project Approval Process

Prior to issuance of any local permit(s) that allows the commencement of construction projects that involve ground disturbance or soil disturbing activities that can potentially generate pollutants in storm water runoff, each Copermittee must:

(1) Require a site-specific Pollution Control, construction BMP, and/or erosion and sediment control plan, to be submitted by the project applicant to the Copermittee;

(2) Confirm the Pollution Control, construction BMP, and/or erosion and sediment control plan, complies with the local grading ordinance, other applicable local

ordinances, and the requirements of this Order;

(3) Confirm the Pollution Control, construction BMP, and/or erosion and sediment control plan, includes seasonally appropriate and effective BMPs and management measures described in Provision E.4.c, as applicable to the project; and

(4) Verify that the project applicant has obtained coverage under ~~applicable permits, including, but not limited to~~ the Construction General Permit~~, Clean Water Act Section 401 Water Quality Certification and Section 404 Permit, and California Department of Fish and Game Streambed Alteration Agreement~~.

~~i.~~c. **CONSTRUCTION SITE INVENTORY AND TRACKING**

(1) Each Copermittee must maintain, and update at least monthly, a watershed-based inventory of all construction projects issued a local permit that allows ground disturbance or soil disturbing activities that can potentially generate pollutants in storm water runoff. The use of an automated database system, such as GIS, is highly recommended. The inventory must include:

(a) Relevant contact information for each site (e.g., name, address, phone, and email for the owner and contractor);

(b) The basic site information including location (address and hydrologic subarea), Waste Discharge Identification (WDID) number (if applicable), size of the site, and approximate area of disturbance;

(c) Whether or not the site is considered a high threat to water quality, as defined in Provision E.4.b.(2) below;

(d) The project start and ~~anticipated completion~~ completed dates;

(e) Current construction phase;

(f) The required inspection frequency, as defined in the Copermittee's jurisdictional runoff management program document;

(g) The date the Copermittee accepted and/or approved the site-specific pollution control, construction BMP, and/or erosion and sediment control plan; and

(h) Whether or not there are ongoing enforcement actions administered to the site.

(2) Each Copermittee must identify all construction sites within its jurisdiction that represent a high threat to downstream surface water quality. The designation of construction sites as high threat to water quality must consider the

following:

(a) Sites located within a hydrologic subarea where sediment is known or suspected to contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan;

(b) Sites located within the same hydrologic subarea and tributary to a water body segment listed as impaired for sediment on the CWA section 303(d) List;

(c) Sites located within, directly adjacent to, or discharging directly to a receiving water within an ESA; and

(d) Other sites determined by the Copermittees or the San Diego Water Board as a high threat to water quality.

~~j.~~d. CONSTRUCTION SITE BMP IMPLEMENTATION

Each Copermittee must implement, or require the implementation of effective BMPs to reduce discharges of pollutants in storm water from construction sites to the MEP, and prevent non-storm water discharges from construction sites into the MS4. These BMPs must be site specific, seasonally appropriate, and construction phase appropriate. BMPs must be implemented at each construction site year round. Dry season BMP implementation must plan for and address unseasonal rain events that may occur during the dry season (May 1 through September 30). Copermittees must implement, or require the implementation of, BMPs in the following categories:

(1) Project Planning;

(2) Good Site Management “Housekeeping”, including waste management;

(3) Non-storm Water Management;

(4) Erosion Control;

(5) Sediment Control;

(6) Run-on and Run-off Control; and

(7) Active/Passive Sediment Treatment Systems, where applicable.

~~k.~~e. CONSTRUCTION SITE INSPECTIONS

Each Copermittee must conduct construction site inspections to require and confirm compliance with its local permits and applicable local ordinances, and the requirements of this Order. Priority for site inspections must consider threat to water quality pursuant to Provision E.4.b as well as the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.

(1) Inspection Frequency

(a) Each Copermittee must conduct inspections at all inventoried sites, including high threat to water quality sites, at an appropriate frequency for each phase of construction to ~~ensure~~ confirm the site reduces the discharge of pollutants in storm water from construction sites to the MEP, and prevents non-storm water discharges from entering the MS4.

(b) Each Copermittee must establish appropriate inspection frequencies for high threat to water quality sites, and all other sites, for each phase of construction. Inspection frequencies appropriate for addressing the highest water quality priorities identified in the Water Quality Improvement Plan, and for complying with the requirements of this Order must be identified in each Copermittee's jurisdictional runoff management program document.

(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e., re-inspection, enforcement) necessary to require and confirm site compliance with its local permits and applicable local ordinances, and the requirements of this Order.

(2) Inspection Content

Inspections of construction sites by the Copermittee must include, at a minimum:

(a) Verification of coverage under the Construction General Permit (Notice of Intent (NOI) and/or WDID number) during initial inspections, when applicable;

(b) Assessment of compliance with its local permits and applicable local ordinances related to pollution prevention, including the implementation and maintenance of applicable BMPs;

(c) Assessment of BMP adequacy and effectiveness;

(d) Visual observations of actual non-storm water discharges;

(e) Visual observations of actual or potential discharge of sediment and/or construction related materials from the site;

(f) Visual observations of actual or potential illicit connections; and

(g) If any violations are found and BMP corrections are needed, inspectors must take and document appropriate actions in accordance with the

Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried construction sites. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must include, at a minimum:

(a) Site name, location (address and hydrologic subarea), and WDID number (if applicable);

(b) Inspection date;

(c) ~~Approximate amount of rainfall since last inspection~~Weather condition during inspection;

(d) Description of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;

(e) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time;

(f) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and

(g) Resolution of problems noted and date problems fixed.

~~l.~~f. CONSTRUCTION SITE ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried construction sites, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

~~m.~~g. STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the construction management program to address construction sites that the Copermittee has identified as potential sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) Provide specific details about how the strategies and/or activities will be

implemented (e.g. designate additional BMPs, focus education, and/or increase/decrease frequency of inspections for specific types of sites and/or activities); and

(2) The strategies and/or activities must be consistent with the requirements of Provisions E.4.c-e and the strategies identified in the Water Quality Improvement Plan.

5. Existing Development Management

Each Copermittee must implement an existing development management program in accordance with the strategies identified in the Water Quality Improvement Plan and includes, at a minimum, the following requirements:

a. Existing Development Inventory and Tracking

Each Copermittee must maintain, and update at least annually, a watershed-based inventory of the existing development within its jurisdiction that ~~may~~ has the reasonable potential to discharge a pollutant load to and from the MS4. The use of an automated database system, such as GIS, is highly recommended. The inventory must, at a minimum, include:

(1) Name, location (hydrological subarea and address, if applicable) of the following types of existing development with its jurisdiction:

(a) Commercial facilities or areas;

(b) Industrial facilities;

(c) Municipal facilities, including:

(i) MS4 and related structures,[30]

(ii) Roads, streets, and highways,

(iii) Parking facilities,

(iv) Municipal airfields,

(v) Parks and recreation facilities,

(vi) Flood management and flood control devices and structures,

(vii) Operating or closed municipal landfills,

(viii) Publicly owned treatment works (including water and wastewater treatment plants) and sanitary sewer collection systems,

[30] The inventory may refer to the MS4 map required to be maintained pursuant to Provision E.2.b.(1).

(ix) Corporate yards, including maintenance and storage yards for materials, waste, equipment, and vehicles,

(x) Hazardous waste collection facilities,

(xi) Other treatment, storage or disposal facilities for municipal waste, and

(xii) Other municipal facilities that the Copermittee determines may contribute a significant pollutant load to the MS4; and

(d) Residential areas, which may be designated by one or more of the following:

(i) Residential management area,

(ii) Drainage basin or area,

(iii) Land use (e.g., single family, multi-family, rural),

(iv) Neighborhood,

(v) Common Interest Area,

(vi) Home Owner Association, and/or

~~(vii) Mobile home park, and/or~~

~~(viii)~~(vii) Other designations accepted by the San Diego Water Board Executive Officer.

(2) A description of the facility or area, including the following information:

(a) Classification as commercial, industrial, municipal, or residential;

(b) Status of facility or area as active or inactive;

(c) Identification if a business is a mobile business;

(d) SIC Code or NAICS Code, if applicable;

(e) Industrial General Permit NOI and/or WDID number, if applicable;

(f) ~~Identification if a residential area is or includes a~~ Common Interest Areas (CIAs) / Home Owner Associations (HOAs)~~, or mobile home park~~;

(g) Identification of pollutants generated and potentially generated by the facility or area;

(h) Whether the facility or area is adjacent to an ESA;

(i) Whether the facility or area is tributary to and within the same hydrologic subarea as a water body segment listed as impaired on the CWA section 303(d) List and generates pollutants for which the water body segment is impaired; and

(j) Whether the facility or area contributes or potentially contributes to the highest priority water quality conditions identified in the Water Quality Improvement Plan.

(3) An annually updated map showing the location of inventoried existing development, watershed boundaries, and water bodies.

b. EXISTING DEVELOPMENT BMP IMPLEMENTATION AND MAINTENANCE

Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development with the reasonable potential to discharge pollutant loads to their MS4, including special event venues. The designated minimum BMPs must be specific to facility or area types and pollutant generating activities, as appropriate.

(1) Commercial, Industrial, and Municipal Facilities and Areas

(a) Pollution Prevention

Each Copermittee must ~~require~~ promote the use of pollution prevention methods by the commercial, industrial, and municipal facilities and areas in its inventoried existing development through public outreach.

(b) BMP Implementation

Each Copermittee must implement, or require the implementation of, designated BMPs at commercial facilities and areas, industrial facilities, and municipal facilities in its inventoried existing development.

(c) BMP Operation and Maintenance

(i) Each Copermittee must properly operate and maintain, or require the proper operation and maintenance of designated BMPs at commercial facilities and areas, industrial facilities, and municipal facilities in its inventoried existing development.

(ii) Each Copermittee must implement a schedule of operation and maintenance activities for its MS4 and related structures (including but not limited to catch basins, storm drain inlets, detention basins, etc.), and verify proper operation of all its municipal structural treatment controls designed to reduce pollutants (including floatables) in storm water discharges to or from its MS4s and related drainage structures. Operation and maintenance activities may include, but is not limited to, the following:

[a] Inspections of the MS4 and related structures;
[b] Cleaning of the MS4 and related structures; and
[c] Proper disposal of materials removed from cleaning of the MS4 and related structures.

(iii) Each Copermittee must implement a schedule of operation and maintenance for public streets, unpaved roads, paved roads, and paved highways and freeways within its jurisdiction to minimize pollutants that can be discharged in storm water.

(iv) Each Copermittee must implement controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers. Copermittees that operate both a municipal sanitary sewer system and a MS4 must implement controls and measures to prevent and eliminate seeping sewage from infiltrating the MS4. Copermittees that do not operate both a municipal sanitary sewer system and a MS4 must coordinate with sewering agencies to keep themselves informed of relevant and appropriate maintenance activities and sanitary sewage projects in their jurisdiction that may cause or contribute to seepage of sewage into the MS4.

(d) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must implement BMPs, or require the implementation of BMPs, to reduce pollutants in storm water discharges to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from commercial facilities and areas, industrial facilities, and municipal facilities in its inventoried existing development. Such BMPs must include, as appropriate, educational activities, permits, certifications and other measures for applicators and distributors.

(2) Residential Areas

(a) Pollution Prevention

Each Copermittee must promote and encourage the use of pollution prevention methods, where appropriate, by the residential areas in its inventoried existing development.

(b) BMP Implementation

Each Copermittee must promote and encourage the implementation of designated BMPs at residential areas in its inventoried existing development.

(c) BMP Operation and Maintenance

Each Copermittee must properly operate and maintain, or require the proper operation and maintenance of designated BMPs at residential areas in its inventoried existing development.

(d) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must promote and encourage the implementation of BMPs to reduce pollutants in storm water discharges to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from residential areas in its inventoried existing development.

c. EXISTING DEVELOPMENT INSPECTIONS

Each Copermittee must conduct inspections of inventoried existing development that have been identified by the Copermittee as having the reasonable potential to discharge pollutant loads from their MS4 to ensure compliance with applicable local ordinances and permits, and the requirements of this Order.

(1) Inspection Frequency

(a) Each Copermittee must establish appropriate inspection frequencies for inventoried existing development in accordance with the following requirements:

(i) At a minimum, inventoried existing development that has been identified by the Copermittee as having the reasonable potential to discharge pollutant loads to and from their MS4 must be inspected once during the permit term ~~every five years~~ utilizing one or more of the following methods:

[a] Drive-by inspections by Copermittee municipal and contract staff,
[b] Onsite inspections by Copermittee municipal and contract staff, and/or
[c] Inspections by volunteer monitoring or patrol programs trained by the Copermittee;

(ii) The frequency of inspections must be appropriate to confirm that BMPs are being implemented to reduce the discharge of pollutants in storm water from the MS4 to the MEP and effectively prohibit non-storm water discharges to the MS4;

(iii) The frequency of inspections must be based on the potential for a facility or area to discharge non-storm water and pollutants in storm water, and should reflect the priorities set forth in the Water Quality Improvement Plan;

(iv) Each Copermittee must annually perform onsite inspections of an equivalent of at least 20 percent of the commercial facilities and areas, industrial facilities, and municipal facilities in its inventoried existing development;[31] and

(v) Inventoried existing development must be inspected by the Copermittee, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff ~~or volunteer monitoring or patrol program~~ inspections.

(b) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e. education and outreach, re-inspection, enforcement) necessary to require and confirm compliance with its applicable local ordinances and permits and the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

(2) Inspection Content

(a) Inspections of existing development by the Copermittee or volunteer monitoring or patrol programs must include, at a minimum:

(i) Visual inspections for actual non-storm water discharges, if present;

(ii) Visual inspections for actual or potential discharge of pollutants, if present;

(iii) Visual inspections for actual or potential illicit connections, if present; and

(iv) Verification that the description of the facility or area in the inventory, required pursuant to Provision E.5.a.(2), has not changed.

(b) Onsite inspections of existing development by the Copermittee must include, at a minimum:

(i) Assessment of compliance with its applicable local ordinances and permits related to non-storm water and storm water discharges and runoff;

(ii) Assessment of the implementation of the designated BMPs;

(iii) Verification of coverage under the Industrial General Permit, when applicable; and

(iv) If any problems or violations are found, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

[31] If any commercial, industrial, or municipal facilities or areas require multiple onsite inspections during any given year, those additional inspection may count toward the total annual inspection requirement. This requirement excludes linear municipal facilities (i.e., MS4, streets, roads and highways).

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried existing development. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must include, at a minimum:

(a) Name and location of facility or area (address and hydrologic subarea) consistent with the inventory name and location, pursuant to Provision E.5.a.(1);

(b) Inspection and re-inspection date(s);

(c) Inspection method(s) (i.e. drive-by, onsite);

(d) Observations and findings from the inspection(s);

(e) For onsite inspections of existing development by Copermittee municipal or contract staff, the records must also include, as applicable:

(i) Description of any problems or violations found during the inspection(s),

(ii) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6, and

(iii) The date problems or violations were resolved.

d. EXISTING DEVELOPMENT ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development identified by the Copermittee as having the reasonable potential to discharge pollutant loads from the MS4 within their jurisdiction, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

e. STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Each Copermittee must implement the water quality improvement strategies, where necessary, to address areas of existing development within its jurisdiction that are identified as sources of pollutants and/or stressors contributing to the highest priority water quality conditions in the Watershed Management Area. For the existing development management program, the following strategies must be implemented:

(1) Specific Existing Development Management Program Strategies

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented within its jurisdiction to address areas of existing development that the Copermittee has identified as sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(a) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional BMPs, focus education, and/or increase/decrease frequency of inspections for specific types of facilities, areas and/or activities);

(b) The facilities and/or areas within the Copermittee's jurisdiction where the strategies and/or activities will be implemented; and

(c) The strategies and/or activities must be consistent with the requirements of Provisions E.5.b-d and the strategies identified in the Water Quality Improvement Plan.

(2) Retrofitting Areas of Existing Development

Each Copermittee must describe in its jurisdictional runoff management program document, a program to retrofit areas of existing development within its jurisdiction to address identified sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area. The program must be implemented as follows:

(a) Each Copermittee must identify areas of existing development as candidates for retrofitting, focusing on areas where retrofitting will address pollutants and/or stressors that contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan;

(b) Candidates for retrofitting projects may be utilized to reduce pollutants that may be discharged in storm water from areas of existing development, and/or address storm water runoff flows and durations from areas of existing development that cause or contribute to hydromodification in receiving waters;

(c) Each Copermittee must develop a strategy to facilitate the implementation of retrofitting projects in areas of existing development identified as candidates;

(d) Each Copermittee should identify areas of existing development where Priority Development Projects may be allowed or should be encouraged to implement or contribute toward the implementation of alternative compliance retrofitting projects; and

(e) Where retrofitting projects within specific areas of existing development are determined to be infeasible to address the highest priority water quality conditions in the Water Quality Improvement Plan, the Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify, develop, and implement regional retrofitting projects (i.e. projects that can receive and/or treat storm water from one or more areas of existing development and will result in a net benefit to water quality and the environment) adjacent to and/or downstream of the areas of existing development.

(3) Stream, Channel and/or Habitat Rehabilitation in Areas of Existing Development

Each Copermittee must describe in its jurisdictional runoff management program document, a program to rehabilitate streams, channels, and/or habitats in areas of existing development within its jurisdiction to address the highest priority water quality conditions in the Watershed Management Area. The program must be implemented as follows:

(a) Each Copermittee must identify streams, channels, and/or habitats in areas of existing development as candidates for rehabilitation, focusing on areas where stream, channel, and/or habitat rehabilitation projects will address the highest priority water quality conditions identified in the Water Quality Improvement Plan;

(b) Candidates for stream, channel, and/or habitat rehabilitation projects may be utilized to address storm water runoff flows and durations from areas of existing development that cause or contribute to hydromodification in receiving waters, rehabilitate channelized or hydromodified streams, restore wetland and riparian habitat, restore watershed functions, and/or restore beneficial uses of receiving waters;

(c) Each Copermittee must develop a strategy to facilitate the implementation of stream, channel, and/or habitat rehabilitation projects in areas of existing development identified as candidates;

(d) Each Copermittee should identify areas of existing development where Priority Development Projects may be allowed or should be encouraged to implement or contribute toward the implementation of alternative compliance stream, channel, and/or habitat rehabilitation projects; and

(e) Where stream, channel, and/or habitat rehabilitation projects within specific areas of existing development are determined to be infeasible to address the highest priority water quality conditions in the Water Quality

Improvement Plan, the Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify, develop, and implement regional stream, channel, and/or habitat rehabilitation projects (i.e. projects that can receive storm water from one or more areas of existing development and will result in a net benefit to water quality and the environment).

(4) Upon Regional Board approval and in lieu of monitoring during any given year, the Copermittees may reallocate resources originally authorized for water quality monitoring for retrofit and/or rehabilitation project(s), if those projects occur at a location where monitoring is conducted, for a maximum of two nonconsecutive years during the permit term.

6. Enforcement Response Plans

Each Copermittee must develop and implement an Enforcement Response Plan as part of its jurisdictional runoff management program document. The Enforcement Response Plan must describe the applicable approaches and options to enforce its legal authority established pursuant to Provision E.1, as necessary, to achieve compliance with the requirements of this Order. The Enforcement Response Plan must include the following:

a. Enforcement Response Plan Components

The Enforcement Response Plan must include the following individual components:

(1) Illicit Discharge Detection and Elimination Enforcement Component;

(2) Development Planning Enforcement Component;

(3) Construction Management Enforcement Component; and

(4) Existing Development Enforcement Component.

b. Enforcement Response Approaches and Options

Each component of the Enforcement Response Plan must describe the enforcement response approaches that the Copermittee will implement to compel compliance with its statutes, ordinances, permits, contracts, orders, or similar means, and the requirements of this Order. The description must include the protocols for implementing progressively stricter enforcement responses. The enforcement response approaches must include appropriate sanctions to compel compliance, including, at a minimum, the following tools or their equivalent:

(1) Verbal and written notices of violation;

(2) Cleanup requirements;

(3) Fines;

(4) Bonding requirements;

(5) Administrative and criminal (if intentional or criminally negligent) penalties;

(6) Liens;

(7) Stop work orders; and

(8) Permit and occupancy denials.

c. CORRECTION OF VIOLATIONS

(1) Violations must be corrected in a timely manner with the goal of correcting the violations within 30 calendar days after the violations are discovered, or prior to the next predicted rain event, whichever is sooner.

(2) If more than 30 calendar days are required to achieve compliance, then a rationale must be recorded in the applicable electronic database or tabular system used to track violations.

d. ESCALATED ENFORCEMENT

(1) The Enforcement Response Plan must include a definition of "escalated enforcement." Escalated enforcement must include any enforcement scenario where a violation or other non-compliance is determined to cause or contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan. Escalated enforcement may be defined differently for development planning, construction sites, commercial facilities or areas, industrial facilities, municipal facilities, and residential areas.

(2) Where the Copermittee determines escalated enforcement is not required, a rationale must be recorded in the applicable electronic database or tabular system used to track violations.

(3) Escalated enforcement actions must continue to increase in severity, as necessary, to compel compliance as soon as possible.

e. REPORTING OF NON-COMPLIANT SITES

(1) Each Copermittee must notify the San Diego Water Board in writing within ~~2~~

~~working days~~ 5 calendar days of issuing escalated enforcement (as defined in the Copermittee's Enforcement Response Plan) to a construction site that poses a significant threat to water quality as a result of violations or other non-compliance with its permits and applicable local ordinances, and the requirements of this Order. Written notification may be provided electronically by email.

(2) Each Copermittee must notify the San Diego Water Board of non-filers under the Industrial General Permit and Construction General Permit by email to Nonfilers_R9@waterboards.ca.gov.

7. Public Education and Participation

Each Copermittee must implement, individually or with other Copermittees, a public education and participation program in accordance with the strategies identified in the Water Quality Improvement Plan to promote and encourage the development of programs, management practices, and behaviors that reduce the discharge of pollutants from the MS4 ~~in storm water~~ to the MEP, prevent controllable non-storm water discharges from entering the MS4, and protect water quality standards in receiving waters.

a. Public Education

The public education program component implemented within the Copermittee's jurisdiction must include, at a minimum, the following:

(1) Educational activities, public information activities, and other appropriate outreach activities intended to reduce pollutants ~~associated with the application of pesticides, herbicides and fertilizer and other pollutants of concern in storm water discharges~~ of concern ~~to and~~ from ~~its~~ the MS4 to the MEP. Activities shall be determined and prioritized by Copermittees by jurisdiction and/or watershed (Provision B) to address the highest threats to water quality (such as pesticides, herbicides and fertilizers, used oil, toxic waste, etc.; and to facilitate the proper management and disposal of used oil and toxic waste, etc.) as determined and prioritized by the Copermittee(s) by jurisdiction and/or watershed to address the highest priority water quality conditions identified in the Water Quality Improvement Plan;

~~(2) Educational activities, public information activities, and other appropriate outreach activities to facilitate the proper management and disposal of used oil and toxic materials; and~~

~~(3)~~(2) Appropriate education and training measures for specific target audiences, such as construction site operators, residents, underserved target audiences and school-aged children, as determined and prioritized by the Copermittee(s) by jurisdiction and/or watershed, based on high risk behaviors and pollutants of concern.

b. PUBLIC PARTICIPATION

The public participation program component implemented within the Copermittee's jurisdiction must include, at a minimum, the following:

(1) A process for members of the public to participate in updating the highest priority water quality conditions, numeric goals, and water quality improvement strategies in the Water Quality Improvement Plan.

(2) Opportunities for members of the public to participate in providing the Copermittee recommendations for improving the effectiveness of the water quality improvement strategies implemented within its jurisdiction.

(3) Opportunities for members of the public to participate in programs and/or activities that can result in the prevention or elimination of non-storm water discharges to the MS4, reduction of pollutants in storm water discharges from the MS4, and/or restoration and protection of the quality of receiving waters.

c. STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented within its jurisdiction, as applicable, to educate the public and encourage public participation to address potential sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) The target audiences and/or areas within the Copermittee's jurisdiction where the strategies and/or activities will be implemented;

(2) Provide specific details about how the strategies and/or activities will be implemented (e.g. educational topics, materials and/or activities, public outreach and participation programs and/or opportunities);

(3) Each Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify and implement regional public education and participation activities, programs and opportunities;

(4) Each Copermittee must incorporate a mechanism for evaluating and

assessing educational and other public outreach activities, as needed, to identify progress and incorporate modifications necessary to increase the effectiveness of the public education and participation program.

8. Fiscal Analysis

a. Each Copermittee must secure the resources necessary to meet all the requirements of this Order.

b. Each Copermittee must conduct an annual fiscal analysis of its jurisdictional runoff management program in its entirety. The fiscal analysis must include the following:

(1) Identification of the various categories of expenditures necessary to implement the requirements of this Order, including a description of the specific capital, operation and maintenance, and other expenditure items to be accounted for in each category of expenditures;

(2) The staff resources needed and allocated to meet the requirements of this Order, including any development, implementation, and enforcement activities required;

(3) The estimated expenditures for Provisions E.8.b.(1) and E.8.b.(2) for the current fiscal year; and

(4) The source(s) of funds that are proposed to meet the necessary expenditures described in Provisions E.8.b.(1) and E.8.b.(2), including legal restrictions on the use of such funds, for the current fiscal year and next fiscal year.

c. Each Copermittee must submit a summary of the annual fiscal analysis with each Annual Report required pursuant to Provision F.3.b.

d. Each Copermittee must provide the documentation used to develop the summary of the annual fiscal analysis upon request by the San Diego Water Board.

F. REPORTING

The purpose of this provision is to determine and document compliance with the requirements set forth in this Order. The goal of reporting is to communicate to the San Diego Water Board and the people of the State of California the implementation status of each jurisdictional runoff management program and compliance with the requirements of this Order. This goal is to be accomplished through the submittal of specific deliverables to the San Diego Water Board by the Copermittees.

1. Water Quality Improvement Plans

The Copermittees for each Watershed Management Area must develop and submit the Water Quality Improvement Plan in accordance with the following requirements:

a. WATER QUALITY IMPROVEMENT PLAN DEVELOPMENT

Each Water Quality Improvement Plan must be developed in accordance with the following process:

(1) Priority Water Quality Conditions and Potential Strategies ~~Numeric Goals~~

(a) The Copermittees must implement a public participation process to solicit data and information to be utilized in the development and identification of the priority water quality conditions for the Watershed Management Area.

(b) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the development of the priority water quality conditions and ~~numeric goals~~ potential strategies to be included in the Water Quality Improvement Plan.

(c) Within 6 months after the commencement of coverage under this Order, the Copermittees must develop and submit the Water Quality Improvement Plan requirements of Provision B.2.a-d and a list of potential strategies that will be considered for the draft Water Quality Improvement Plan to the San Diego Water Board. Each Copermittee selecting the option to develop a Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism per Provision B.3.a.(3) must also indicate their intent to pursue the option in the submittal. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 60 days.

(d) The Copermittees must consider ~~revise~~ revisions to the priority water quality conditions ~~and numeric goals~~ based on comments received and must respond to ~~and/or~~ recommendations or direction from the San Diego Water Board Executive Officer.

(2) Numeric Goals and Water Quality Improvement Strategies and Schedules

(a) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the development of the numeric goals and water quality improvement strategies and schedules to be included in the Water Quality Improvement Plan.

(b) Within ~~9~~ 16 months after the commencement of coverage under this Order, the Copermittees must develop and submit the Water Quality Improvement Plan requirements of Provisions B.2.e and B.3 to the San Diego Water Board. Each Copermittee selecting the option to develop a Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism per Provision B.3.a.(3) must also submit a draft Reasonable Assurance Analysis. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 60 days.

(c) The Copermittees must consider revisions to~~revise~~ the numeric goals and water quality improvement strategies and schedules based on public comments received ~~and/or~~ and must respond to recommendations or direction from the San Diego Water Board Executive Officer.

b. WATER QUALITY IMPROVEMENT PLAN SUBMITTAL

(1) Within ~~18~~ 24 months after the commencement of coverage under this Order, the Copermittees for each Watershed Management Area must submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B to the San Diego Water Board. Each Copermittees selecting the option to develop a Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism per Provision B.3.a.(3) must also submit a final Reasonable Assurance Analysis. The Santa Margarita River Watershed Management Area must submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B to the San Diego Water Board 18 months after the Riverside Copermittees are covered under this Order. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 30 days.

(2) Based on the comments received, the San Diego Water Board will determine whether to hold a public hearing or to limit public input to submittal of written comments. If no hearing is held the San Diego Water Board will notify the Copermittees within 6 months that the Water Quality Improvement Plan has been accepted as complete following its review and determination that the Water Quality Improvement Plan meets the requirements of this Order.

(3) The Copermittees must consider revisions to ~~revise~~ the Water Quality Improvement Plan based on public comments received ~~and/or~~ and must

respond to recommendations or direction from the San Diego Water Board Executive Officer.

(4) The Water Quality Improvement Plan must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of acceptance by the San Diego Water Board.

(5) Copermittees must commence with implementation of the Water Quality Improvement Plan no later than the fiscal year (July 1) following San Diego Water Board approval of the Water Quality Improvement Plan.

2. Updates

a. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATES

Each Copermittee must update its jurisdictional runoff management program document in accordance with the following requirements:

(1) Each Copermittee is encouraged to involve the public and key stakeholders as early and often as possible to solicit recommendations for updates to its jurisdictional runoff management program document.

(2) Each Copermittee must update its jurisdictional runoff management program document to incorporate the requirements of Provision E no later than ~~18~~24 months after the commencement of coverage under this Order.

(3) Each Copermittee must submit updates to its jurisdictional runoff management program, with a rationale for the modifications, either in the Annual Report required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b.

(4) The Copermittee must revise the modifications as directed by the San Diego Water Board Executive Officer.

(5) Updated jurisdictional runoff management program documents must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of submitting the Annual Report.

b. BMP DESIGN MANUAL UPDATES

Each Copermittee must update its BMP Design Manual in accordance with the following requirements:

(1) Each Copermittee must update its BMP Design Manual to incorporate the requirements of Provisions E.3.a-d no later than ~~18~~24 months after the commencement of coverage under this Order.

(2) Subsequent updates must be consistent with the requirements of Provisions E.3.a-d and must be submitted as part of the Annual Reports required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b.

(3) Updated BMP Design Manuals must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of completing the update.

c. Water Quality Improvement Plan Updates

The Water Quality Improvement Plans must be updated in accordance with the following process:

(1) The Copermittees must implement a public participation process to solicit data and information to be utilized in updating the Water Quality Improvement Plan.

(2) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the updates to the Water Quality Improvement Plan.

(3) The Copermittees for each Watershed Management Area must submit requested updates to the Water Quality Improvement Plan, with the public input received and the rationale for the requested updates, either in the Annual Reports required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b. The requested updates are considered accepted by the San Diego Water Board if no response is provided to the Copermittee after 3 months of submitting the request.

(4) The Copermittees must revise the requested updates as directed by the San Diego Water Board Executive Officer.

(5) Updated Water Quality Improvement Plans must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of acceptance of the requested updates by the San Diego Water Board.

3. Progress Reporting

a. Progress Report Presentations

The Copermittees for each Watershed Management Area must appear before the San Diego Water Board, as requested by the San Diego Water Board, to provide progress reports on the implementation of the Water Quality

Improvement Plan and jurisdictional runoff management programs.

b. ANNUAL REPORTS

(1) The Copermittees for each Watershed Management Area must submit an Annual Report for each reporting period no later than January 31 of the following year. The annual reporting period consists of two periods: 1) July 1 to June 30 of the following year for the jurisdictional runoff management programs, 2) October 1 to September 30 of the following year for the monitoring and assessment programs. The first Annual Report must be prepared for the reporting period beginning July 1 after commencement of coverage under this Order, and upon San Diego Water Board determination that the Water Quality Improvement Plan meets the requirements of this Order to June 30 in the following year for the jurisdictional runoff management programs. ~~,~~ The first Annual Report must be prepared for the reporting period beginning 50 days after adoption of this Order and the January 31st following the first September 30th (conclusion of monitoring season) after the San Diego Water Board determines that the Water Quality Improvement Plan meets the requirements of this Order ~~and September 30 in the following year~~ for the monitoring and assessment programs. Annual Reports must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Each Annual Report must include the following:

(a) The receiving water and MS4 outfall discharge monitoring data collected pursuant to Provisions D.1 and D.2, summarized and presented in tabular and graphical form;

(b) Progress of the special studies required pursuant to Provision D.3, and the results or findings when a special study, or each phase of a special study, is completed;

(c) The findings from the assessments required pursuant to Provision D.4;

(d) The progress of implementing the Water Quality Improvement Plan, including, but not limited to, the following:

(i) The progress toward achieving the interim and final numeric goals for the highest water quality priorities for the Watershed Management Area,

(ii) The water quality improvement strategies that were implemented and/or no longer implemented by each of the Copermittees during the reporting period and previous reporting periods, and are planned to be implemented during the next reporting period,

(iii) Proposed modifications to the water quality improvement strategies, with public input received and rationale for the proposed modifications,

(iv) Previously proposed modifications or updates incorporated into the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document and implemented by the Copermittees in the Watershed Management Area, and

(v) Proposed modifications or updates to the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document;

(d) A completed Jurisdictional Runoff Management Program Annual Report Form (Attachment D or accepted revision) for each Copermittee in the Watershed Management Area, certified by a Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative.

(2) Each Copermittee must complete and submit a Jurisdictional Runoff Management Program Annual Report Form (Attachment D or accepted revision) no later than October 31 of each year until the first Annual Report is required to be submitted. Each Copermittee must submit the information on the Jurisdictional Runoff Management Program Annual Report Form specific to the area within its jurisdiction in each Watershed Management Area.

(3) Each Copermittee must provide any data or documentation utilized in developing the Annual Report upon request by the San Diego Water Board. ~~Any~~ Copermittee monitoring data utilized in developing the Annual Report must be uploaded to the California Environmental Data Exchange Network (CEDEN).[32] Any Copermittee monitoring and assessment data utilized in developing the Annual Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.

~~c. REGIONAL MONITORING AND ASSESSMENT REPORT~~

~~(1) The Copermittees must submit a Regional Monitoring and Assessment Report no later than 180 days in advance of the expiration date of this Order. The Regional Monitoring and Assessment Report may be submitted as part of the Report of Waste Discharge required pursuant to Provision F.5.b. The Copermittees must review the receiving water and MS4 outfall discharge monitoring data collected pursuant to Provisions D.1 and D.2, and findings from the assessments required pursuant to Provision D.4, to assess the following:~~

~~(a) The beneficial uses of the receiving waters within the San Diego Region~~

[32] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

~~that are protected or must be restored;~~

~~(b) The progress toward restoring impacted beneficial uses in the receiving waters within the San Diego Region; and~~

~~(c) Pollutants or conditions of emerging concern that may impact beneficial uses in the receiving waters within the San Diego Region.~~

~~(2) The Regional Monitoring and Assessment Report must include recommendations for improving the implementation and assessment of the Water Quality Improvement Plans and jurisdictional runoff management programs.~~

~~(3) Each Copermittee must provide any data or documentation utilized in developing the Regional Monitoring and Assessment Report upon request by the San Diego Water Board. Any monitoring and assessment data utilized in developing the Regional Monitoring and Assessment Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.~~

4. Regional Clearinghouse

The Copermittees must develop, update, and maintain an internet-based Regional Clearinghouse that is made available to the public no later than 18 months after the effective date of this Order.[33]

a. The Copermittees, through the Regional Clearinghouse, must make the following documents and data available, organized by Watershed Management Area, which may be linked to other internet-based data portals and databases where the original documents are stored:

(1) Water Quality Improvement Plan for the Watershed Management Area, and all updated versions with date of update;

(2) Annual Reports for the Watershed Management Area;

(3) Jurisdictional Runoff Management Program document for each Copermittee within the Watershed Management Area, and all updated versions with date of update;

(4) BMP Design Manual for each Copermittee within the Watershed Management Area, and all updated versions with date of update;

[33] The Copermittee may elect to develop and maintain the clearinghouse(s) provided by other Copermittees or agencies.

(5) Reports from special studies (e.g. source identification, BMP effectiveness assessment) conducted in the Watershed Management Area;

(6) Monitoring data collected pursuant to Provision D for each Watershed Management Area must be uploaded to CEDEN,[34] with links to the uploaded data; and

(7) Available GIS data, layers, and/or shapefiles used to develop the maps generated and maintained by the Copermittees for the Water Quality Improvement Plans, Annual Reports, and jurisdictional runoff management program documents.

b. The Copermittees, through the Regional Clearinghouse, must make the following information and documents available:

(1) Contact information (point of contact, phone number, email address, and mailing address) for each Copermittee;

(2) Public hotline number for reporting non-storm water and illicit discharges for each Copermittee;

[34] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

(3) Email address for reporting non-storm water and illicit discharges for each Copermittee;

(4) Link to each Copermittee's website, if available, where the public may find additional information about the Copermittee's storm water management program and for requesting records for the implementation of its program;

(5) Information about opportunities for the public to participate in programs and/or activities that can result in the prevention or elimination of non-storm water discharges to the MS4, reduction of pollutants in storm water discharges from the MS4, and/or restoration and protection of the quality of receiving waters; and

(6) Reports from regional monitoring programs in which the Copermittees participate (e.g. Southern California Monitoring Coalition, Southern California Coastal Water Research Project Bight Monitoring);

(7) Regional Monitoring and Assessment Reports; and

(8) Any other information, data, and documents the Copermittees determine as appropriate for making available to the public.

5. Report of Waste Discharge

a. The Orange County Copermittees and the Riverside County Copermittees are required to submit a complete Report of Waste Discharge pursuant to the requirements of their current Orders. The San Diego Water Board will review and consider the Reports of Waste Discharge to determine whether modification to this Order, pursuant to the requirements of Provision H, will be required prior the Orange County Copermittees and/or Riverside County Copermittees becoming covered under this Order. The current Orders for the Orange County Copermittees and Riverside County Copermittees are rescinded upon notification of coverage under this Order except for enforcement purposes.

b. The Copermittees subject to the requirements of this Order must submit to the San Diego Water Board a complete Report of Waste Discharge as an application for the re-issuance of this Order and NPDES permit. The Report of Waste Discharge must be submitted no later than 180 days in advance of the expiration date of this Order. The Report of Waste Discharge must contain the following minimum information:

(1) Names and addresses of the Copermittees;

(2) Names and titles of the primary contacts of the Copermittees;

(3) Proposed changes to the Copermittees' Water Quality Improvement Plans and the supporting justification;

(4) Proposed changes to the Copermittees' jurisdictional runoff management programs and the supporting justification;

(5) Any other information necessary for the re-issuance of this Order;

(6) Any information to be included as part of the Report of Waste Discharge pursuant to the requirements of this Order; and

(7) Any other information required by federal regulations for NPDES permit reissuance.

6. Application for Early Coverage

a. The Orange County Copermittees, collectively, or Riverside County Copermittees, collectively, may apply for early coverage under this Order by submitting a Report of Waste Discharge Form 200, with a written request for early coverage under this Order.

b. The San Diego Water Board will review the application for early coverage. A notification of coverage under this Order will be issued to the Copermittees in the respective county by the San Diego Water Board upon completion of the early coverage application requirements. The effective coverage date will be specified in the notification of coverage. The Copermittees in the respective county are authorized to have MS4 discharges pursuant to the requirements of this Order starting on the effective coverage date specified in the notification of coverage. The existing Order for the respective county is rescinded upon the effective coverage date specified in the notification of coverage except for enforcement purposes.

7. Reporting Provisions

Each Copermittee must comply with all the reporting and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

G. PRINCIPAL WATERSHED COPERMITTEE RESPONSIBILITIES

1. The Copermittees within each Watershed Management Area must designate a Principal Watershed Copermittee and notify the San Diego Water Board of the name of the Principal Watershed Copermittee. ~~An individual Copermittee should not be designated a Principal Watershed Copermittee for more than two Watershed Management Areas.~~ The notification may be submitted with the Water Quality Improvement Plan required pursuant to Provision F.1 of this Order.

2. All Copermittees have some level of commitment, not just the Principal Watershed Copermittee. The Principal Watershed Copermittee is responsible for, at a minimum, the following:

- **a.** Serving as liaison between the Copermittees in the Watershed Management Area and the San Diego Water Board on general permit issues, and when necessary and appropriate, representing the Copermittees in the Watershed Management Area before the San Diego Water Board.

- **b.** Facilitating the development of the Water Quality Improvement Plan in accordance with the requirements of Provision B of this Order

- **c.** Coordinating the submittal of the deliverables required by Provisions F.1, F.2, F.3.a, and F.3.b of this Order.

- **d.** Coordinating and developing, with the other Principal Watershed Copermittees, the requirements of Provisions F.3.c, F.4, and F.5.b of this Order.

H. MODIFICATION OF PROGRAMS

1. Modifications of the Order may be initiated by the San Diego Water Board or by the Copermittees. Requests by Copermittees must be made to the San Diego Water Board.

2. Minor modifications to the Order may be made by the San Diego Water Board where the proposed modification complies with all the effective prohibitions and limitations, and other requirements of this Order.

3. Proposed modifications to the Order outside of the Water Quality Improvement Plan process that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures.

4. The San Diego Water Board may re-open and modify this Order at any time prior to its expiration, after opportunity for public comment and a public hearing, if the State Water Board determines that revisions are warranted to those provisions of the Order addressing compliance with water quality standards in the receiving water and/or those provisions of the Order establishing an iterative process for implementation of management practices to assure compliance with water quality standards in the receiving water.

~~4.~~5. The San Diego Water Board may re-open and modify this order at any time prior to its expiration, after opportunity for public comment and a public hearing, if the Basin Plan Amendments for any of the TMDLs in Attachment E are revised by the San Diego Regional Board. Should a TMDL Basin Plan Amendment be revised and adopted by the Regional Board, then the Regional Board will re-open this Order as soon as possible to update the TMDL requirements in Attachment E to reflect the revised Basin Plan Amendment.

I. STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

Each Copermittee must comply with all the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

ATTACHMENT A

DISCHARGE PROHIBITIONS AND SPECIAL PROTECTIONS

1. Basin Plan Waste Discharge Prohibitions

California Water Code Section 13243 provides that a Regional Water Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste or certain types of waste is not permitted. The following waste discharge prohibitions in the Water Quality Control Plan for the San Diego Basin (Basin Plan) are applicable to any person, as defined by Section 13050(c) of the California Water Code, who is a citizen, domiciliary, or political agency or entity of California whose activities in California could affect the quality of waters of the state within the boundaries of the San Diego Region.

1. The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code Section 13050, is prohibited.

2. The discharge of waste to land, except as authorized by waste discharge requirements or the terms described in California Water Code Section 13264 is prohibited.

3. The discharge of pollutants or dredged or fill material to waters of the United States except as authorized by a National Pollutant Discharge Elimination System (NPDES) permit or a dredged or fill material permit (subject to the exemption described in California Water Code Section 13376) is prohibited.

4. Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this San Diego Water Board issues a NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State Department of Health Services (DHS) and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.

5. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the San Diego Water Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.

6. The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the San Diego Water Board.

7. The dumping, deposition, or discharge of waste directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the San Diego Water Board.

8. Any discharge to a storm water conveyance system that is not composed entirely of "*storm water*" is effectively prohibited unless authorized by the San Diego Water Board. [The federal regulations, 40 CFR 122.26(b)(13), define storm water as storm water runoff, snow melt runoff, and surface runoff and drainage. 40 CFR 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities.] [§122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].

9. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.

10. The discharge of industrial wastes to conventional septic tank/subsurface disposal systems, except as authorized by the terms described in California Water Code Section 13264, is prohibited.

11. The discharge of radioactive wastes amenable to alternative methods of disposal into the waters of the state is prohibited.

12. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.

13. The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the San Diego Water Board.

14. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.

15. The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.

16. The discharge of untreated sewage from vessels to San Diego Bay is prohibited.

17. The discharge of treated sewage from vessels to portions of San Diego Bay that are less than 30 feet deep at mean lower low water (MLLW) is prohibited.

18. The discharge of treated sewage from vessels, which do not have a properly functioning US Coast Guard certified Type I or Type II marine sanitation device, to portions of San Diego Bay that are greater than 30 feet deep at mean lower low water (MLLW) is prohibited.

2. Attachment B to State Water Board Resolution 2012-0012

Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges

I. PROVISIONS FOR POINT SOURCE DISCHARGES OF STORM WATER AND NONPOINT SOURCE WASTE DISCHARGES

The following terms, prohibitions, and special conditions (hereafter collectively referred to as special conditions) are established as limitations on point source storm water and nonpoint source discharges. These special conditions provide Special Protections for marine aquatic life and natural water quality in Areas of Special Biological Significance (ASBS), as required for State Water Quality Protection Areas pursuant to California Public Resources Code Sections 36700(f) and 36710(f). These Special Protections are adopted by the State Water Board as part of the California Ocean Plan (Ocean Plan) General Exception.

The special conditions are organized by category of discharge. The State Water Resources Control Board (State Water Board) and Regional Water Quality Control Boards (Regional Water Boards) will determine categories and the means of regulation for those categories [e.g., Point Source Storm Water National Pollutant Discharge Elimination System (NPDES) or Nonpoint Source].

A. PERMITTED POINT SOURCE DISCHARGES OF STORM WATER

1. General Provisions for Permitted Point Source Discharges of Storm Water

    a. Existing storm water discharges into an ASBS are allowed only under the following conditions:

        (1) The discharges are authorized by an NPDES permit issued by the State Water Board or Regional Water Board;

        (2) The discharges comply with all of the applicable terms, prohibitions, and special conditions contained in these Special Protections; and

        (3) The discharges:

            (i) Are essential for flood control or slope stability, including roof, landscape, road, and parking lot drainage;

            (ii) Are designed to prevent soil erosion;

            (iii) Occur only during wet weather;

(iv) Are composed of only storm water runoff.

b. Discharges composed of storm water runoff shall not alter natural ocean water quality in an ASBS.

c. The discharge of trash is prohibited.

d. Only discharges from existing storm water outfalls are allowed. Any proposed or new storm water runoff discharge shall be routed to existing storm water discharge outfalls and shall not result in any new contribution of waste to an ASBS (i.e., no additional pollutant loading). “Existing storm water outfalls” are those that were constructed or under construction prior to January 1, 2005. “New contribution of waste” is defined as any addition of waste beyond what would have occurred as of January 1, 2005. A change to an existing storm water outfall, in terms of re-location or alteration, in order to comply with these special conditions, is allowed and does not constitute a new discharge.

e. Non-storm water discharges are prohibited except as provided below:

(1) The term “non-storm water discharges” means any waste discharges from a municipal separate storm sewer system (MS4) or other NPDES permitted storm drain system to an ASBS that are not composed entirely of storm water.

(2) (i) The following non-storm water discharges are allowed, provided that the discharges are essential for emergency response purposes, structural stability, slope stability or occur naturally:

(a) Discharges associated with emergency fire fighting operations.

(b) Foundation and footing drains.

(c) Water from crawl space or basement pumps.

(d) Hillside dewatering.

(e) Naturally occurring groundwater seepage via a storm drain.

(f) Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.

(ii) An NPDES permitting authority may authorize non-storm water discharges to an MS4 with a direct discharge to an ASBS only to the extent the

NPDES permitting authority finds that the discharge does not alter natural ocean water quality in the ASBS.

(3) Authorized non-storm water discharges shall not cause or contribute to a violation of the water quality objectives in Chapter II of the Ocean Plan nor alter natural ocean water quality in an ASBS.

2. Compliance Plans for Inclusion in Storm Water Management Plans (SWMP) and Storm Water Pollution Prevention Plans (SWPPP).

The discharger shall specifically address the prohibition of non-storm water runoff and the requirement to maintain natural water quality for storm water discharges to an ASBS in an ASBS Compliance Plan to be included in its SWMP or a SWPPP, as appropriate to permit type. If a statewide permit includes a SWMP, then the discharger shall prepare a stand-alone compliance plan for ASBS discharges. The ASBS Compliance Plan is subject to approval by the Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (for permits issued by Regional Water Boards).

a. The Compliance Plan shall include a map of surface drainage of storm water runoff, showing areas of sheet runoff, prioritize discharges, and describe any structural Best Management Practices (BMPs) already employed and/or BMPs to be employed in the future. Priority discharges are those that pose the greatest water quality threat and which are identified to require installation of structural BMPs. The map shall also show the storm water conveyances in relation to other features such as service areas, sewage conveyances and treatment facilities, landslides, areas prone to erosion, and waste and hazardous material storage areas, if applicable. The SWMP or SWPPP shall also include a procedure for updating the map and plan when changes are made to the storm water conveyance facilities.

b. The ASBS Compliance Plan shall describe the measures by which all non-authorized non-storm water runoff (e.g., dry weather flows) has been eliminated, how these measures will be maintained over time, and how these measures are monitored and documented.

c. For Municipal Separate Storm Sewer System (MS4s), the ASBS Compliance Plan shall require minimum inspection frequencies as follows:

(1) The minimum inspection frequency for construction sites shall be weekly during rainy season;

(2) The minimum inspection frequency for industrial facilities shall be monthly during the rainy season;

(3) The minimum inspection frequency for commercial facilities (e.g., restaurants) shall be twice during the rainy season; and

(4) Storm water outfall drains equal to or greater than 18 inches (457 mm) in diameter or width shall be inspected once prior to the beginning of the rainy season and once during the rainy season and maintained to remove trash and other anthropogenic debris.

d. The ASBS Compliance Plan shall address storm water discharges (wet weather flows) and, in particular, describe how pollutant reductions in storm water runoff, that are necessary to comply with these special conditions, will be achieved through BMPs. Structural BMPs need not be installed if the discharger can document to the satisfaction of the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that such installation would pose a threat to health or safety. BMPs to control storm water runoff discharges (at the end-of-pipe) during a design storm shall be designed to achieve on average the following target levels:

(1) Table B Instantaneous Maximum Water Quality Objectives in Chapter II of the Ocean Plan; or

(2) A 90% reduction in pollutant loading during storm events, for the applicant's total discharges. The baseline for the reduction is the effective date of the Exception. The baseline for these determinations is the effective date of the Exception, and the reductions must be achieved and documented within four (4) years of the effective date.

e. The ASBS Compliance Plan shall address erosion control and the prevention of anthropogenic sedimentation in ASBS. The natural habitat conditions in the ASBS shall not be altered as a result of anthropogenic sedimentation.

f. The ASBS Compliance Plan shall describe the non-structural BMPs currently employed and planned in the future (including those for construction activities), and include an implementation schedule. The ASBS Compliance Plan shall include non-structural BMPs that address public education and outreach. Education and outreach efforts must adequately inform the public that direct discharges of pollutants from private property not entering an MS4 are prohibited. The ASBS Compliance Plan shall also describe the structural BMPs, including any low impact development (LID) measures, currently employed and planned for higher threat discharges and include an implementation schedule. To control storm water runoff discharges (at the end-of-pipe) during a design storm, permittees must first consider using LID practices to infiltrate, use, or evapotranspirate storm water runoff on-site.

g. The BMPs and implementation schedule shall be designed to ensure that natural water quality conditions in the receiving water are achieved and maintained by either reducing flows from impervious surfaces or reducing pollutant loading, or some combination thereof.

h. If the results of the receiving water monitoring described in IV.B. of these special conditions indicate that the storm water runoff is causing or contributing to an alteration of natural ocean water quality in the ASBS, the discharger shall submit a report to the State Water Board and Regional Water Board within 30 days of receiving the results.

(1) The report shall identify the constituents in storm water runoff that alter natural ocean water quality and the sources of these constituents.

(2) The report shall describe BMPs that are currently being implemented, BMPs that are identified in the SWMP or SWPPP for future implementation, and any additional BMPs that may be added to the SWMP or SWPPP to address the alteration of natural water quality. The report shall include a new or modified implementation schedule for the BMPs.

(3) Within 30 days of the approval of the report by the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits), the discharger shall revise its ASBS Compliance Plan to incorporate any new or modified BMPs that have been or will be implemented, the implementation schedule, and any additional monitoring required.

(4) As long as the discharger has complied with the procedures described above and is implementing the revised SWMP or SWPPP, the discharger does not have to repeat the same procedure for continuing or recurring exceedances of natural ocean water quality conditions due to the same constituent.

(5) Compliance with this section does not excuse violations of any term, prohibition, or condition contained in these Special Protections.

3. Compliance Schedule

a. On the effective date of the Exception, all non-authorized non-storm water discharges (e.g., dry weather flow) are effectively prohibited.

b. Within one year from the effective date of the Exception, the discharger shall submit a written ASBS Compliance Plan to the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that describes its strategy to comply with these special conditions, including the requirement to maintain natural water quality in the affected ASBS. The ASBS Compliance Plan shall include a time schedule to implement appropriate non-structural and structural controls (implementation schedule) to comply with these special conditions for inclusion in the discharger's SWMP or SWPPP, as appropriate to permit type.

c. Within 18 months of the effective date of the Exception, any non-structural controls that are necessary to comply with these special conditions shall be implemented.

d. Within four (4) years of the effective date of the Exception, any structural controls identified in the ASBS Compliance Plan that are necessary to comply with these special conditions shall be operational.

e. Within four (4) years of the effective date of the Exception, all dischargers must comply with the requirement that their discharges into the affected ASBS maintain natural ocean water quality. If the initial results of post-storm receiving water quality testing indicate levels higher than the 85th percentile threshold of reference water quality data and the pre-storm receiving water levels, then the discharger must re-sample the receiving water, pre- and post-storm. If after re-sampling the post-storm levels are still higher than the 85th percentile threshold of reference water quality data, and the pre-storm receiving water levels, for any constituent, then natural ocean water quality is exceeded. See attached Flowchart.

f. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may only authorize additional time to comply with the special conditions d. and e., above if good cause exists to do so. Good cause means a physical impossibility or lack of funding.

If a discharger claims physical impossibility, it shall notify the Board in writing within thirty (30) days of the date that the discharger first knew of the event or circumstance that caused or would cause it to fail to meet the deadline in d. or e. The notice shall describe the reason for the noncompliance or anticipated noncompliance and specifically refer to this Section of this Exception. It shall describe the anticipated length of time the delay in compliance may persist, the cause or causes of the delay as well as measures to minimize the impact of the delay on water quality, the measures taken or to be taken by the discharger to prevent or minimize the delay, the schedule by which the measures will be implemented, and the anticipated date of compliance. The discharger shall adopt all reasonable measures to avoid and minimize such delays and their impact on water quality.

The discharger may request an extension of time for compliance based on lack of funding. The request for an extension shall require:

(1) for municipalities, a demonstration of significant hardship to discharger ratepayers, by showing the relationship of storm water fees to annual

household income for residents within the discharger's jurisdictional area, and the discharger has made timely and complete applications for all available bond and grant funding, and either no bond or grant funding is available, or bond and/or grant funding is inadequate; or

(2) for other governmental agencies, a demonstration and documentation of a good faith effort to acquire funding through that agency's budgetary process.

B. NONPOINT SOURCE DISCHARGES

[NOT INCLUDED]
[PROVISIONS FOR NONPOINT SOURCE DISCHARGES NOT APPLICABLE]

II. ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES

[NOT INCLUDED]
[ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES NOT APPLICABLE]

III. ADDITIONAL REQUIREMENTS – WATERFRONT AND MARINE OPERATIONS

[NOT INCLUDED]
[ADDITIONAL REQUIREMENTS FOR WATERFRONT AND MARINE OPERATIONS NOT APPLICABLE]

IV. MONITORING REQUIREMENTS

Monitoring is mandatory for all dischargers to assure compliance with the Ocean Plan. Monitoring requirements include both: (A) core discharge monitoring, and (B) ocean receiving water monitoring. The State and Regional Water Boards must approve sampling site locations and any adjustments to the monitoring programs. All ocean receiving water and reference area monitoring must be comparable with the Water Boards' Surface Water Ambient Monitoring Program (SWAMP).

Safety concerns: Sample locations and sampling periods must be determined considering safety issues. Sampling may be postponed upon notification to the State and Regional Water Boards if hazardous conditions prevail.

Analytical Chemistry Methods: All constituents must be analyzed using the lowest minimum detection limits comparable to the Ocean Plan water quality objectives. For metal analysis, all samples, including storm water effluent, reference samples, and ocean receiving water samples, must be analyzed by the approved analytical method with the lowest minimum detection limits (currently Inductively Coupled Plasma/Mass Spectrometry) described in the Ocean Plan.

A. CORE DISCHARGE MONITORING PROGRAM

1. General sampling requirements for timing and storm size:

   Runoff must be collected during a storm event that is greater than 0.1 inch and generates runoff, and at least 72 hours from the previously measurable storm event. Runoff samples shall be collected when post-storm receiving water is sampled, and analyzed for the same constituents as receiving water and reference site samples (see section IV B) as described below.

2. Runoff flow measurements

   a. For municipal/industrial storm water outfalls in existence as of December 31, 2007, 18 inches (457mm) or greater in diameter/width (including multiple outfall pipes in combination having a width of 18 inches, runoff flows must be measured or calculated, using a method acceptable to and approved by the State and Regional Water Boards.
   b. This will be reported annually for each precipitation season to the State and Regional Water Boards.

3. Runoff samples – storm events

   a. For outfalls equal to or greater than 18 inches (0.46m) in diameter or width:

      (1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination, ; and

      (2) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS

      (3) If an applicant has no outfall greater than 36 inches, then storm water runoff from the applicant's largest outfall shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates).

   b. For outfalls equal to or greater than 36 inches (0.91m) in diameter or width:

      (1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and,

within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination; and

(2) samples of storm water runoff shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates) and

(3) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS.

c. For an applicant not participating in a regional monitoring program [see below in Section IV (B)] in addition to (a.) and (b.) above, a minimum of the two largest outfalls or 20 percent of the larger outfalls, whichever is greater, shall be sampled (flow weighted composite samples) at least three times annually during wet weather (storm event) and analyzed for all Ocean Plan Table A constituents, Table B constituents for marine aquatic life protection (except for toxicity, only chronic toxicity for three species shall be required), DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, and Ocean Plan indicator bacteria. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one (the largest) such discharge shall be sampled annually in each Region.

4. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may reduce or suspend core monitoring once the storm runoff is fully characterized. This determination may be made at any point after the discharge is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

B. OCEAN RECEIVING WATER AND REFERENCE AREA MONITORING PROGRAM

In addition to performing the Core Discharge Monitoring Program in Section II.A above, all applicants having authorized discharges must perform ocean receiving water monitoring. In order to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS, dischargers may choose either (1) an individual monitoring program, or (2) participation in a regional integrated monitoring program.

1. Individual Monitoring Program: The requirements listed below are for those dischargers who elect to perform an individual monitoring program to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within the affected ASBS. In addition to Core Discharge Monitoring, the following additional monitoring requirements shall be met:

a. Three times annually, during wet weather (storm events), the receiving water at the point of discharge from the outfalls described in section (IV)(A)(3)(c) above shall be sampled and analyzed for Ocean Plan Table A constituents, Table B constituents for marine aquatic life, DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, salinity, chronic toxicity (three species), and Ocean Plan indicator bacteria.

   The sample location for the ocean receiving water shall be in the surf zone at the point of discharges; this must be at the same location where storm water runoff is sampled. Receiving water shall be sampled at approximately the same time prior to (pre-storm) and during (or immediately after) the same storm (post storm). Reference water quality shall also be sampled and analyzed for the same constituents pre-storm and post-storm, during the same storms when receiving water is sampled. Reference stations will be determined by the State Water Board's Division of Water Quality and the applicable Regional Water Board(s).

b. Sediment sampling shall occur at least three times during every five (5) year period. The subtidal sediment (sand or finer, if present) at the discharge shall be sampled and analyzed for Ocean Plan Table B constituents for marine aquatic life, DDT, PCBs, PAHs, pyrethroids, and OP pesticides. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed.

c. A quantitative survey of intertidal benthic marine life shall be performed at the discharge and at a reference site. The survey shall be performed at least once every five (5) year period. The survey design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The results of the survey shall be completed and submitted to the State Water Board and Regional Water Board at least six months prior to the end of the permit cycle.

d. Once during each five (5) year period, a bioaccumulation study shall be conducted to determine the concentrations of metals and synthetic organic pollutants at representative discharge sites and at representative reference sites. The study design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The bioaccumulation study may include California mussels (Mytilus californianus) and/or sand crabs (Emerita analoga or Blepharipoda occidentalis). Based on the study results, the Regional Water Board and the State Water Board's Division of Water Quality, may adjust the study design in subsequent permits, or add or modify additional test organisms (such as shore crabs or fish), or modify the study design appropriate for the area and best available sensitive measures of contaminant exposure.

e. Marine Debris: Representative quantitative observations for trash by type and source shall be performed along the coast of the ASBS within the influence of the discharger's outfalls. The design, including locations and frequency, of the marine debris observations is subject to approval by the Regional Water Board and State Water Board's Division of Water Quality.

f. The monitoring requirements of the Individual Monitoring Program in this section are minimum requirements. After a minimum of one (1) year of continuous water quality monitoring of the discharges and ocean receiving waters, the Executive Director of the State Water Board (statewide permits) or Executive officer of the Regional Water Board (Regional Water Board permits) may require additional monitoring, or adjust, reduce or suspend receiving water and reference station monitoring. This determination may be made at any point after the discharge and receiving water is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

2. Regional Integrated Monitoring Program: Dischargers may elect to participate in a regional integrated monitoring program, in lieu of an individual monitoring program, to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS. This regional approach shall characterize natural water quality, pre- and post-storm, in ocean reference areas near the mouths of identified open space watersheds and the effects of the discharges on natural water quality (physical, chemical, and toxicity) in the ASBS receiving waters, and should include benthic marine aquatic life and bioaccumulation components. The design of the ASBS stratum of a regional integrated monitoring program may deviate from the otherwise prescribed individual monitoring approach (in Section IV.B.1) if approved by the State Water Board's Division of Water Quality and the Regional Water Boards.

a. Ocean reference areas shall be located at the drainages of flowing watersheds with minimal development (in no instance more than 10% development), and shall not be located in CWA Section 303(d) listed waterbodies or have tributaries that are 303(d) listed. Reference areas shall be free of wastewater discharges and anthropogenic non-storm water runoff. A minimum of low threat storm runoff discharges (e.g. stream highway overpasses and campgrounds) may be allowed on a case-by-case basis. Reference areas shall be located in the same region as the ASBS receiving water monitoring occurs. The reference areas for each Region are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean reference water samples must be collected from each station, each from a separate storm. A minimum of one reference location shall be sampled for each ASBS receiving water site sampled per responsible party. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

b. ASBS ocean receiving water must be sampled in the surf zone at the location where the runoff makes contact with ocean water (i.e. at "point zero"). Ocean receiving water stations must be representative of worst-case discharge conditions (i.e. co-located at a large drain greater than 36 inches, or if drains greater than 36 inches are not present in the ASBS then the largest drain greater than18 inches.) Ocean receiving water stations are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean receiving water samples must be collected during each storm season from each station, each from a separate storm. A minimum of one receiving water location shall be sampled in each ASBS per responsible party in that ASBS. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

c. Reference and receiving water sampling shall commence during the first full storm season following the adoption of these special conditions, and post-storm samples shall be collected when annual storm water runoff is sampled. Sampling shall occur in a minimum of two storm seasons. For those ASBS dischargers that have already participated in the Southern California Bight 2008 ASBS regional monitoring effort, sampling may be limited to only one storm season.

d. Receiving water and reference samples shall be analyzed for the same constituents as storm water runoff samples. At a minimum, constituents to be sampled and analyzed in reference and discharge receiving waters must include oil and grease, total suspended solids, Ocean Plan Table B metals for protection of marine life, Ocean Plan PAHs, pyrethroids, OP pesticides, ammonia, nitrate, phosphates, and critical life stage chronic toxicity for three species. In addition, within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination shall be analyzed.

3. Waterfront and Marine Operations: In addition to the above requirements for ocean receiving water monitoring, additional monitoring must be performed for marinas and boat launch and pier facilities:

a. For all marina or mooring field operators, in mooring fields with 10 or more occupied moorings, the ocean receiving water must be sampled for Ocean Plan indicator bacteria, residual chlorine, copper, zinc, grease and oil, methylene blue active substances (MBAS), and ammonia nitrogen.

(1) For mooring field operators opting for an individual monitoring program (Section IV.B.1 above), this sampling must occur weekly (on the weekend) from May through October.

(2) For mooring field operators opting to participate in a regional integrated monitoring program (Section IV.B.2 above), this sampling must occur monthly from May through October on a high use weekend in each month. The Water

Boards may allow a reduction in the frequency of sampling, through the regional monitoring program, after the first year of monitoring.

b. For all mooring field operators, the subtidal sediment (sand or finer, if present) within mooring fields and below piers shall be sampled and analyzed for Ocean Plan Table B metals (for marine aquatic life beneficial use), acute toxicity, PAHs, and tributyltin. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed. This sampling shall occur at least three times during a five (5) year period. For mooring field operators opting to participate in a regional integrated monitoring program, the Water Boards may allow a reduction in the frequency of sampling after the first sampling effort's results are assessed.

STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

1. Standard Permit Provisions

Code of Federal Regulations Title 40 Section 122.41 (40 CFR 122.41) includes conditions, or provisions, that apply to all National Pollutant Discharge Elimination System (NPDES) permits. Additional provisions applicable to NPDES permits are in 40 CFR 122.42. All applicable provisions in 40 CFR 122.41 and 40 CFR 122.42 must be incorporated into this Order and NPDES permit. The applicable 40 CFR 122.41 and 40 CFR 122.42 provisions are as follows:

a. DUTY TO COMPLY [40 CFR 122.41(a)]

The Copermittee must comply with all of the provisions of this permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.

(1) The Copermittee must comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement. [40 CFR 122.41(a)(1)]

(2) The CWA provides that any person who violates Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any such sections in a permit issued under Section 402, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to a civil penalty not to exceed $25,000 per day for each violation. The CWA provides that any person who *negligently* violates Section 301, 302, 306, 307, 308, 318, or 405 of the CWA, or any condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than 1 year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than 2 years, or both. Any person who *knowingly* violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than 3 years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than 6 years, or both. Any person who knowingly violates Section 301, 302, 303, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of

not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in Section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.
[40 CFR 122.41(a)(2)]

(3) Any person may be assessed an administrative penalty by the San Diego Regional Water Quality Control Board (San Diego Water Board), State Water Resources Control Board (State Water Board), or United States Environmental Protection Agency (USEPA) for violating Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed $10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed $25,000. Penalties for Class II violations are not to exceed $10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed $125,000.
[40 CFR 122.41(a)(3)]

b. DUTY TO REAPPLY [40 CFR 122.41(b)]

If a Copermittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the Copermittee must apply for and obtain a new permit.

c. NEED TO HALT OR REDUCE ACTIVITY NOT A DEFENSE [40 CFR 122.41(c)]

It shall not be a defense for a Copermittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

d. DUTY TO MITIGATE [40 CFR 122.41(d)]

The Copermittee must take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this permit that has a reasonable likelihood of adversely affecting human health or the environment.

e. PROPER OPERATION AND MAINTENANCE [40 CFR 122.41(e)]

The Copermittee must at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Copermittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems that are installed by a Copermittee only when the operation is necessary to achieve compliance with the conditions of this permit.

f. PERMIT ACTIONS [40 CFR 122.41(f)]

This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Copermittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

g. PROPERTY RIGHTS [40 CFR 122.41(g)]

This permit does not convey any property rights of any sort, or any exclusive privilege.

h. DUTY TO PROVIDE INFORMATION [40 CFR 122.41(h)]

The Copermittee must furnish to the San Diego Water Board, State Water Board, or USEPA within a reasonable time, any information which the San Diego Water Board, State Water Board, or USPEA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The Copermittee must also furnish to the San Diego Water Board, State Water Board, or USPEA upon request, copies of records required to be kept by this permit.

i. INSPECTION AND ENTRY [40 CFR 122.41(i)]

The Copermittee must allow the San Diego Water Board, State Water Board, USEPA, and/or their authorized representative (including an authorized contractor acting as their representative), upon presentation of credentials and other documents as may be required by law, to:

(1) Enter upon the Copermittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit; [40 CFR 122.41(i)(1)]

(2) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit; [40 CFR 122.41(i)(2)]

(3) Inspect and photograph at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; [40 CFR 122.41(i)(3)] and

(4) Sample or monitor at reasonable times, for the purpose of assuring permit compliance or as otherwise authorized by the CWA, any substances or parameters at any location. [40 CFR 122.41(i)(4)]

j. MONITORING AND RECORDS [40 CFR 122.41(j)]

(1) Samples and measurements taken for the purpose of monitoring must be representative of the monitored activity. [40 CFR 122.41(j)(1)]

(2) Except for records of monitoring information required by this permit related to the Copermittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five (5) years (or longer as required by 40 CFR Part 503), the

Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time. [40 CFR 122.41(j)(2)]

(3) Records for monitoring information must include: [40 CFR 122.41(j)(3)]

(a) The date, exact place, and time of sampling or measurements; [40 CFR 122.41(j)(3)(i)]
(b) The individual(s) who performed the sampling or measurements; [40 CFR 122.41(j)(3)(ii)]
(c) The date(s) analyses were performed; [40 CFR 122.41(j)(3)(iii)]
(d) The individual(s) who performed the analyses; [40 CFR 122.41(j)(3)(iv)]
(e) The analytical techniques or methods used; [40 CFR 122.41(j)(3)(v)] and
(f) The results of such analyses. [40 CFR 122.41(j)(3)(vi)]

(4) Monitoring must be conducted according to test procedures under 40 CFR Part 136 unless another method is required under 40 CFR Subchapters N or O. [40 CFR 122.41(j)(4)]

In the case of pollutants for which there are no approved methods under 40 CFR Part 136 or otherwise required under 40 CFR Subchapters N and O, monitoring must be conducted according to a test procedure specified in the permit for such pollutants. [40 CFR 122.44(i)(1)(iv)]

(5) The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both. [40 CFR 122.41(j)(5)]

k. SIGNATORY REQUIREMENT [40 CFR 122.41(k)]

(1) All applications, reports, or information submitted to the San Diego Water Board, State Water Board, or USEPA must be signed and certified. (See 40 CFR 122.22) [40 CFR 122.41(k)(1)]

(a) *For a municipality, State, Federal, or other public agency.* [All applications must be signed] [b]y either a principal executive officer or ranking elected official. [40 CFR 122.22(a)(3)]

(b) All reports required by permits, and other information requested by the San Diego Water Board, State Water Board, or USEPA must be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if: [40 CFR 122.22(b)]

(i) The authorization is made in writing by a person described in paragraph (a) of this section; [40 CFR 122.22(b)(1)]

(ii) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company, (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) [40 CFR 122.22(b)(2)] and,

(iii) The written authorization is submitted to the San Diego Water Board and State Water Board. [40 CFR 122.22(b)(3)]

(c) *Changes to authorization.* If an authorization under paragraph (b) of this section is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (b) of this section must be submitted to the San Diego Water Board prior to or together with any reports, information, or applications to be signed by an authorized representative. [40 CFR 122.22(c)]

(d) *Certification.* Any person signing a document under paragraph (a) or (b) of this section shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." [40 CFR 122.22(d)]

(2) The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both. [40 CFR 122.41(k)(2)]

I. REPORTING REQUIREMENTS [40 CFR 122.41(l)]

(1) *Planned changes.* The Copermittee must give notice to the San Diego Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required only when: [40 CFR 122.41(l)(1)]

(a) The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR 122.29(b); [40 CFR 122.41(l)(1)(i)] or

(b) The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which

are subject neither to effluent limitations in the permit, nor to notification requirements under 40 CFR 122.42(a)(1).
[40 CFR 122.41(l)(1)(ii)]

(c) The alteration or addition results in a significant change in the Copermittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. [40 CFR 122.41(l)(1)(iii)]

(2) *Anticipated noncompliance*. The Copermittee must give advance notice to the San Diego Water Board or State Water Board of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.
[40 CFR 122.41(l)(2)]

(3) *Transfers*. This permit is not transferable to any person except after notice to the San Diego Water Board. The San Diego Water Board may require modification or revocation and reissuance of the permit to change the name of the Copermittee and incorporate such other requirements as may be necessary under the CWA.
[40 CFR 122.41(l)(3)]

(4) *Monitoring reports.* Monitoring results must be reported at the intervals specified elsewhere in this permit. [40 CFR 122.41(l)(4)]

(a) Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the San Diego Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. [40 CFR 122.41(l)(4)(i)]

(b) If the Copermittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR Part 136 or another method required for an industry-specific waste stream under 40 CFR Subchapters N or O, the results of this monitoring must be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the San Diego Water Board or State Water Board.
[40 CFR 122.41(l)(4)(ii)]

(c) Calculations for all limitations which require averaging of measurements must utilize an arithmetic mean unless otherwise specified in the permit.
[40 CFR 122.41(l)(4)(iii)]

(5) *Compliance schedules*. Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit must be submitted no later than 14 days following each schedule date. [40 CFR 122.41(l)(5)]

(6) *Twenty-four hour reporting.*

(a) The Copermittee must report any noncompliance that may endanger health or the environment. Any information must be provided orally within 24 hours from the time the Copermittee becomes aware of the circumstances. A written submission must also be provided within five (5) days of the time the Copermittee becomes aware of the circumstances. The written submission must contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. [40 CFR 122.41(l)(6)(i)]

(b) The following must be included as information which must be reported within 24 hours under this paragraph: [40 CFR 122.41(l)(6)(ii)]

(i) Any unanticipated bypass that exceeds any effluent limitation in the permit (See 40 CFR 122.41(g)). [40 CFR 122.41(l)(6)(ii)(A)]
(ii) Any upset which exceeds any effluent limitation in the permit. [40 CFR 122.41(l)(6)(ii)(B)] and,
(iii) Violation of a maximum daily discharge limitation for any of the pollutants listed by the San Diego Water Board in the permit to be reported within 24 hours. (See 40 CFR 122.44(g)) [40 CFR 122.41(l)(6)(ii)(C)]

(c) The San Diego Water Board may waive the above-required written report on a case-by-case basis if the oral report has been received within 24 hours. [40 CFR 122.41(l)(6)(iii)]

(7) *Other noncompliance.* The Copermittee must report all instances of noncompliance not reported in accordance with the standard provisions required under 40 CFR 122.41(l)(4), (5), and (6), at the time monitoring reports are submitted. The reports must contain the information listed in the standard provisions required under 40 CFR 122.41(l)(6). [40 CFR 122.41(l)(7))]

(8) *Other information.* When the Copermittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the San Diego Water Board, State Water Board, or USEPA, the Copermittee must promptly submit such facts or information. [40 CFR 122.41(l)(8)]

~~**m. BYPASS** [40 CFR 122.41(m)]~~

~~(1) *Definitions.*~~

~~(a) "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. [40 CFR 122.41(m)(1)(i)] or~~

~~(b) "Severe property damage" means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be~~

~~expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.~~
~~[40 CFR 122.41(m)(1)(ii)]~~

~~(2) *Bypass not exceeding limitations*. The Copermittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the standard provisions required under 40 CFR 122.41(m)(3) and (4).~~
~~[40 CFR 122.41(m)(2)]~~

~~(3) *Notice.*~~

~~(a) *Anticipated bypass*. If the Copermittee knows in advance of the need for a bypass, it must submit a notice, if possible at least ten days before the date of the bypass. [40 CFR 122.41(m)(3)(i)] or~~

~~(b) *Unanticipated bypass*. The Copermittee must submit notice of an unanticipated bypass in accordance with the standard provisions required under 40 CFR 122.41(l)(6) (24-hour notice).~~
~~[40 CFR 122.41(m)(3)(ii)]~~

~~(4) *Prohibition of Bypass.*~~

~~(a) Bypass is prohibited, and the San Diego Water Board may take enforcement action against a Copermittee for bypass, unless:~~
~~[40 CFR 122.41(m)(4)(i)]~~

~~(i) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage; [40 CFR 122.41(m)(4)(i)(A)]~~
~~(ii) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance;~~
~~[40 CFR 122.41(m)(4)(i)(B)] and,~~
~~(iii) The Copermittee submitted notice in accordance with the standard provisions required under 40 CFR 122.41(m)(3).~~
~~[40 CFR 122.41(m)(4)(i)(C)]~~

~~(b) The San Diego Water Board may approve an anticipated bypass, after considering its adverse effects, if the San Diego Water Board determines that it will meet the three conditions listed above.~~
~~[40 CFR 122.41(m)(4)(ii)]~~

~~n.~~m. **UPSET** [40 CFR 122.41(n)]

(1) *Definition.* “Upset” means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Copermittee. An upset does not

include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. [40 CFR 122.41(n)(1)]

(2) *Effect of an upset*. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the standard provisions required under 40 CFR 122.41(n)(3) are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. [40 CFR 122.41(n)(2)]

(3) *Conditions necessary for a demonstration of upset*. A Copermittee who wishes to establish the affirmative defense of upset must demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that: [40 CFR 122.41(n)(3)]

(a) An upset occurred and that the Copermittee can identify the cause(s) of the upset; [40 CFR 122.41(n)(3)(i)]
(b) The permitted facility was at the time being properly operated; [40 CFR 122.41(n)(3)(ii)] and
(c) The Copermittee submitted notice of the upset in accordance with the standard provisions required under 40 CFR 122.41(l)(6)(ii)(B) (24-hour notice). [40 CFR 122.41(n)(3)(iii)]
(d) The Copermittee complied with any remedial measures pursuant to the standard provisions required under 40 CFR 122.41(d). [40 CFR 122.41(n)(3)(iii)]

(4) *Burden of proof*. In any enforcement proceeding, the Copermittee seeking to establish the occurrence of an upset has the burden of proof. [40 CFR 122.41(n)(4)]

~~o.~~n. STANDARD PERMIT PROVISIONS FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS

[40 CFR 122.42(c)]

The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the San Diego Water Board or State Water Board under 40 CFR 122.26(a)(1)(v) must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report must include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions; [40 CFR 122.42(c)(1)]

(2) Proposed changes to the storm water management programs that are established as permit conditions. Such proposed changes must be consistent with 40 CFR 122.26(d)(2)(iii); [40 CFR 122.42(c)(2)] and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under 40 CFR 122.26(d)(2)(iv) and (v); [40 CFR 122.42(c)(3)]

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; [40 CFR 122.42(c)(4)]

(5) Annual expenditures and budget for year following each annual report; [40 CFR 122.42(c)(5)]

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; [40 CFR 122.42(c)(6)]

(7) Identification of water quality improvements or degradation. [40 CFR 122.42(c)(7)]

~~p.~~o. **STANDARD PERMIT PROVISIONS FOR STORM WATER DISCHARGES** [40 CFR 122.42(d)]

The initial permits for discharges composed entirely of storm water issued pursuant to 40 CFR 122.26(e)(7) must require compliance with the conditions of the permit as expeditiously as practicable, but in no event later than three years after the date of issuance of the permit.

2. General Provisions

In addition to the standard provisions required to be incorporated into the Order and NPDES permit pursuant to 40 CFR 122.41 and 40 CFR 122.42, several other general provisions apply to this Order. The general provisions applicable to this Order and NPDES permit are as follows:

a. DISCHARGE OF WASTE IS A PRIVILEGE

No discharge of waste into the waters of the State, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the State are privileges, not rights. [CWC Section 13263(g)]

b. DURATION OF ORDER AND NPDES PERMIT

(1) *Effective date*. This Order and NPDES permit becomes effective on the 50th day after its adoption provided the USEPA has no objection. If the USEPA objects to its issuance, this Order shall not become effective until such objection is withdrawn. This Order supersedes Order No. R9-2007-0001 upon the effective date of this Order, and supersedes Order Nos. R9-2009-0002 and R9-2010-0016 upon their expiration or earlier notice of coverage.

(2) *Expiration*. This Order and NPDES permit expires five years after its effective date. [40 CFR 122.46(a)]

(3) *Continuation of expired order*. After this Order and NPDES permit expires, the terms and conditions of this Order and NPDES permit are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on the continuation of expired permits (40 CFR 122.6) are complied with.

c. AVAILABILITY

A copy of this Order must be kept at a readily accessible location and must be available to on-site personnel at all times.

d. CONFIDENTIALITY OF INFORMATION

Except as provided for in 40 CFR 122.7, no information or documents submitted in accordance with or in application for this Order will be considered confidential, and all such information and documents shall be available for review by the public at the San Diego Water Board office.

Claims of confidentiality for the following information will be denied:
[40 CFR 122.7(b)]

(1) The name and address of any permit applicant or Copermittee; [40 CFR 122.7(b)(1)] and

(2) Permit applications and attachments, permits, and effluent data. [40 CFR 122.7(b)(2)]

e. EFFLUENT LIMITATIONS

(1) *Interim effluent limitations*. The Copermittee must comply with any interim effluent limitations as established by addendum, enforcement action, or revised waste discharge requirements which have been, or may be, adopted by the San Diego Water Board.

(2) *Other effluent limitations and standards*. If any applicable toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant and that standard or prohibition is more stringent than any limitation on the pollutant in the permit, the San Diego Water Board shall institute proceedings under these regulations to modify or revoke and reissue the permit to conform to the toxic effluent standard or prohibition. [40 CFR 122.44(b)(1)].

f. DUTY TO MINIMIZE OR CORRECT ADVERSE IMPACTS

The Copermittee must take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncompliance.

g. PERMIT ACTIONS

The filing of a request by the Copermittee for modification, revocation and reissuance, or termination of this Order, or a notification of planned change in or anticipated noncompliance with this Order does not stay any condition of this Order. (See 40 CFR

122.41(f)) In addition, the following provisions apply to this Order:

(1) Upon application by any affected person, or on its own motion, the San Diego Water Board may review and revise the requirements in this Order. All requirements must be reviewed periodically. [CWC Section 13263(e)]

(2) This Order may be terminated or modified for cause, including, but not limited to, all of the following: [CWC Section 13381]

(a) Violation of any condition contained in the requirements of this Order. [CWC Section 13381(a)]

(b) Obtaining the requirements in this Order by misrepresentation, or failure to disclose fully all relevant facts. [CWC Section 13381(b)]

(c) A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge. [CWC Section 13381(c)]

(3) When this Order is transferred to a new owner or operator, such requirements as may be necessary under the CWC may be incorporated into this Order.

h. NPDES PERMITTED NON-STORM WATER DISCHARGES

The San Diego Water Board has, in prior years, issued a limited number of individual NPDES permits for non-storm water discharges to MS4s. The San Diego Water Board or State Water Board may in the future, upon prior notice to the Copermittee(s), issue an NPDES permit for any non-storm water discharge (or class of non-storm water discharges) to an MS4. A Copermittee will not be held responsible for pollutants in its MS4 discharge originating from an NPDES-permitted non-storm water discharge.

i. MONITORING

In addition to the standard provisions required under 40 CFR 122.41(j) and (l)(4), the following general monitoring provisions apply to this Order:

(1) Where procedures are not otherwise specified in Order, sampling, analysis and quality assurance/quality control must be conducted in accordance with the Quality Assurance Management Plan (QAMP) for the State of California's Surface Water Ambient Monitoring Program (SWAMP), adopted by the State Water Resources Control Board (State Water Board).

~~(2) Pursuant to 40 CFR 122.41(j)(2) and CWC Section 13383(a), each Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least five (5) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time.~~

~~(3)~~(2) All chemical, bacteriological, and toxicity analyses must be conducted at a laboratory certified for such analyses by the California Department of Public Health or a laboratory approved by the San Diego Water Board.

~~(4)~~(3) For priority toxic pollutants that are identified in the California Toxics Rule (CTR) (65 Fed. Reg. 31682), the Copermittees must instruct their laboratories to establish calibration standards that are equivalent to or lower than the Minimum Levels (MLs) published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). If a Copermittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR Part 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Copermittee must submit documentation from the laboratory to the San Diego Water Board for approval prior to raising the ML for any priority toxic pollutant.

j. ENFORCEMENT

(1) The San Diego Water Board is authorized to enforce the terms of this Order under several provisions of the CWC, including, but not limited to, CWC Sections 13385, 13386, and 13387.

(2) Nothing in this Order shall be construed to protect the Copermittee from its liabilities under federal, state, or local laws.

(3) The CWC provides for civil and criminal penalties comparable to, and in some cases greater than, those provided for under the CWA.

(4) Except as provided in the standard conditions required under 40 CFR 122.41(m) and (n), nothing in this Order shall be construed to relieve the Copermittee from civil or criminal penalties for noncompliance.

(5) Nothing in this Order shall be construed to preclude the institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties to which the Copermittee is or may be subject to under Section 311 of the CWA.

(6) Nothing in this Order shall be construed to preclude institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties established pursuant to any applicable state law or regulation under authoring preserved by Section 510 of the CWA.

k. SEVERABILITY

The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this Order shall not be affected thereby.

l. APPLICATIONS

Any application submitted by a Copermittee for reissuance or modification of this Order must satisfy all applicable requirements specified in federal regulations as well as any additional requirements for submittal of a Report of Waste Discharge specified in the CWC and the California Code of Regulations.

m. IMPLEMENTATION

All plans, reports and subsequent amendments submitted in compliance with this Order must be implemented immediately (or as otherwise specified). All submittals by Copermittees must be adequate to implement the requirements of this Order.

n. REPORT SUBMITTALS

(1) All report submittals must include an executive summary, introduction, conclusion, recommendations, and signed certified statement.

(2) Each Copermittee must submit a signed certified statement covering its responsibilities for each applicable submittal.

(3) The Principal Watershed Copermittee(s) must submit a signed certified statement covering its responsibilities for each applicable submittal and the sections of the submittals for which it is responsible.

(4) Unless otherwise directed, the Copermittees must submit one hard copy and one electronic copy of each report required under this Order to the San Diego Water Board, and one electronic copy to the USEPA.

(5) The Copermittees must submit reports and provide notifications as required by this Order to the following:

DEFINITIONS

Active/Passive Sediment Treatment - Using mechanical, electrical or chemical means to flocculate or coagulate suspended sediment for removal from runoff from construction sites prior to discharge.

Anthropogenic Litter – Trash generated from human activities, not including sediment.

Automotive Repair Shop – a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539 or equivalent NAICS code.

Average Monthly Action Level – The highest allowable average of daily discharges over a calendar month.

Beneficial Uses - The uses of water necessary for the survival or wellbeing of man, plants, and wildlife. These uses of water serve to promote tangible and intangible economic, social, and environmental goals. "Beneficial Uses" of the waters of the State that may be protected include, but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. Existing beneficial uses are uses that were attained in the surface or ground water on or after November 28, 1975; and potential beneficial uses are uses that would probably develop in future years through the implementation of various control measures. "Beneficial Uses" are equivalent to "Designated Uses" under federal law. [California Water Code Section 13050(f)].

Best Management Practices (BMPs) - Defined in 40 CFR 122.2 as schedules of activities, effective prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. In the case of municipal discharge permits, BMPs may be used in the place of numeric effluent limits.

Bioassessment - The use of biological community information to evaluate the biological integrity of a water body and its watershed. With respect to aquatic ecosystems, bioassessment is the collection and analysis of samples of the benthic macroinvertebrate community together with physical/habitat quality measurements associated with the sampling site and the watershed to evaluate the biological condition (i.e. biotic integrity) of a water body.

Biofiltration - Practices that use vegetation and amended soils to detain and treat runoff from impervious areas. Treatment is through filtration, infiltration, adsorption, ion exchange, and biological uptake of pollutants.

Biological Integrity - Defined in Karr J.R. and D.R. Dudley. 1981. Ecological perspective on water quality goals. *Environmental Management* 5:55-68 as: "A balanced, integrated, adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of natural habitat of the region." Also referred to as ecosystem health.

BMP Design Manual – A plan developed to eliminate, reduce, or mitigate the impacts of runoff from development projects, including Priority Development Projects.

Channel Rehabilitation and Improvement – Remedial measures or activities for the purpose of improving or restoring the environmental health of streams, channels or river systems. Techniques may vary from in-stream restoration techniques to off-line stormwater management practices installed in the system corridor or upland areas. Rehabilitation techniques may include, but are not limited to the following: riparian zone restoration, constructed wetlands, bank stabilization, channel modifications, and day lighting of drainage systems. Effectiveness may be measured in various manners, included: assessment of habitat, reduced stream bank erosion, and restoration of water and sediment transport balance.

Clean Water Act Section 303(d) Water Body - An impaired water body in which water quality does not meet applicable water quality standards and/or is not expected to meet water quality standards, even after the application of technology based pollution controls required by the CWA. The discharge of runoff to these water bodies by the Copermittees is significant because these discharges can cause or contribute to violations of applicable water quality standards.

Construction Site – Any project, including projects requiring coverage under the Construction General Permit, that involves soil disturbing activities greater than 10,000 square feet including, but not limited to, clearing, grading, disturbances to ground such as stockpiling, and excavation. This does not include interior construction activities such as interior remodeling, plumbing, electrical, or mechanical work.

Contamination - As defined in the Porter-Cologne Water Quality Control Act, contamination is "an impairment of the quality of waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease. 'Contamination' includes any equivalent effect resulting from the disposal of waste whether or not waters of the State are affected."

Copermittee – An incorporated city within the County of Orange, County of Riverside, or County of San Diego in the San Diego Region (Region 9), the County of Orange, the County of Riverside, the County of San Diego, the Orange County Flood Control District, the Riverside County Water Conservation and Flood Control District, the San Diego Regional Airport Authority, or the San Diego Unified Port District.

Copermittees – All of the individual Copermittees, collectively.

Critical Channel Flow (Qc) – The channel flow that produces the critical shear stress that initiates bed movement or that erodes the toe of channel banks. When measuring Qc, it should be based on the weakest boundary material – either bed or bank.

Daily Discharge – Defined as either: (1) the total mass of the constituent discharged over the calendar day or any 24 hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g. concentration.)

The Daily Discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day, or other 24 hour period other than a day), or by the arithmetic mean of analytical results from one or more grab samples taken over the course of a day.

Development Projects - Construction, rehabilitation, redevelopment, or reconstruction of any public or private ~~residential~~ projects involving land disturbance activities~~, industrial, commercial, or any other projects~~.

Direct Discharge to an Environmentally Sensitive Area – Flow that is conveyed overland a distance of 200 ft or less from the development to the ESA, or conveyed in a pipe any amount of distance as an isolated flow from the development to the ESA (i.e. not commingled with flows from adjacent lands).

Dry Season –May 1 to September 30.

Dry Weather – Weather is considered dry if the preceding 72 hours has been without measurable precipitation (>0.1 inch).

Enclosed Bays – Enclosed bays are indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost bay works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays do not include inland surface waters or ocean waters.

Erosion – When land is diminished or worn away due to wind, water, or glacial ice. Often the eroded debris (silt or sediment) becomes a pollutant via storm water runoff. Erosion occurs naturally but can be intensified by land clearing activities such as farming, development, road building, and timber harvesting.

Environmentally Sensitive Areas (ESAs) - Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Board and San Diego Water Board; State Water Quality Protected Areas; water bodies designated with the RARE beneficial use by the State Water Board and San Diego Water Board; areas designated as preserves or their equivalent under the Natural Communities Conservation Program within the Cities and County of Orange; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees.

Estuaries – Waters, including coastal lagoons, located at the mouth of streams that serve as areas of mixing fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and ocean water. Estuaries do not include inland surface waters or ocean waters.

Existing Development – Any area that has been developed and exists for municipal, commercial, industrial, or residential purposes, uses, or activities. May include areas that are not actively used for its originally developed purpose, but may be re-purposed or redeveloped for another use or activity.

Flow Duration – The long-term period of time that flows occur above a threshold that causes significant sediment transport and may cause excessive erosion damage to creeks and streams (not a single storm event duration). The simplest way to visualize this is to consider a histogram of pre- and post-project flows using long-term records of hourly data. To maintain pre-development flow duration means that the total number of hours (counts) within each range of flows in a flow-duration histogram cannot increase between the pre- and post-development condition. Flow duration within the range of geomorphologically significant flows is important for managing erosion.

Grading - The cutting and/or filling of the land surface to a desired slope or elevation.

Hazardous Material – Any substance that poses a threat to human health or the environment due to its toxicity, corrosiveness, ignitability, explosive nature or chemical reactivity. These also include materials named by the USEPA in 40 CFR 116 to be reported if a designated quantity of the material is spilled into the waters of the U.S. or emitted into the environment.

Hazardous Waste - Hazardous waste is defined as "any waste which, under Section 600 of Title 22 of this code, is required to be managed according to Chapter 30 of Division 4.5 of Title 22 of this code" [CCR Title 22, Division 4.5, Chapter 11, Article 1].

Household Hazardous Waste – Paints, cleaning products, and other hazardous wastes generated during home improvement or maintenance activities.

Hydromodification – The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, such as stream channelization, concrete lining, installation of dams and water impoundments, and excessive streambank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Illicit Connection – Any connection to the MS4 that conveys an illicit discharge.

Illicit Discharge - Any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities [40 CFR 122.26(b)(2)].

Inactive Areas – Areas of construction activity that are not active and those that have been active and are not scheduled to be re-disturbed for at least 14 days.

Infiltration – Water other than wastewater that enters a sewer system (including sewer service connections and foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow [40 CFR 35.2005(20)].

Inland Surface Waters – Includes all surface waters of the U.S. ~~State~~ that do not include the ocean, enclosed bays, or estuaries.

Jurisdictional Runoff Management Program Document – A written description of the specific jurisdictional runoff management measures and programs that each Copermittee will implement to comply with this Order and ensure that storm water pollutant discharges in runoff are reduced to the MEP and do not cause or contribute to a violation of water quality standards.

Low Impact Development (LID) – A storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

Low Impact Development Best Management Practices (LID BMPs) – LID BMPs include schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States through storm water management and land development strategies that emphasize conservation ~~s~~and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions. LID BMPs include retention practices that do not allow runoff, such as infiltration, rain water harvesting and reuse, and evapotranspiration. LID BMPs also include flow-through practices such as biofiltration that may have some discharge of storm water following pollutant reduction.

Major Outfall – As defined in the Code of Federal Regulations, a major outfall is a MS4 outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (i.e. discharge from a single conveyance other than a circular pipe which is associated with a drainage area of more than 50 acres); or, for MS4s that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or equivalent), a MS4 outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (i.e. discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

Maximum Daily Action Level (MDAL) –The highest allowable daily discharge of a pollutant, over a calendar day (or 24 hour period). For pollutants with action levels expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with action levels expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Maximum Extent Practicable (MEP) – The technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) for ~~storm water~~ discharges of pollutants that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve, typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense). MEP considers economics and is generally, but not necessarily, less stringent than BAT. A definition for MEP is not provided either in the statute or in the regulations. Instead the definition of MEP is dynamic and will be defined by the following process over time: municipalities propose their definition of MEP by way of their runoff management programs. Their total collective and individual activities conducted pursuant to the runoff management programs becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance). In the absence of a proposal acceptable to the San Diego Water Board, the San Diego Water Board defines MEP.

In a memo dated February 11, 1993, entitled "Definition of Maximum Extent Practicable," Elizabeth Jennings, Senior Staff Counsel, SWRCB addressed the achievement of the MEP standard as follows:

"*To achieve the MEP standard, municipalities must employ whatever Best Management*

Practices (BMPs) are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:

a. Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?
b. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
c. Public Acceptance: Does the BMP have public support?
d. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?
e. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

The final determination regarding whether a municipality has reduced pollutants to the maximum extent practicable can only be made by the Regional or State Water Boards, and not by the municipal discharger. If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit derived, it would have met the standard. Where a choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP based solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be lightly rejected. In any case, the burden would be on the municipal discharger to show compliance with its permit. After selecting a menu of BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented."

Monitoring Year – October 1 to September 30

Municipal Separate Storm Sewer System (MS4) – A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) Designated or used for collecting or conveying storm water; (iii) Which is not a combined sewer; (iv) Which is not part of the Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.22~~26~~. Copermittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.21(a)(vi).

National Pollutant Discharge Elimination System (NPDES) - The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Sections 307, 318, 402, and 405 of the CWA.

Non-Storm Water - All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). Non-storm water includes illicit discharges and NPDES permitted discharges and the discharges described in Provision E(2)(a)(3)-(5).

Nuisance - As defined in the Porter-Cologne Water Quality Control Act, a nuisance is "anything which meets all of the following requirements: 1) Is injurious to health, or is indecent, or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. 2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. 3) Occurs during, or as a result of, the treatment or disposal of wastes."

Ocean Waters – the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Board's California Ocean Plan.

Order – Unless otherwise specified, refers to this Order, Order No. R9-2013-0001 (NPDES No. CAS0109266)

Outfall - *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States. 40 C.F.R. 122.26(b)(9).

Parking Lot – a land area or facility for the tempraory parking or storage of motor vehicles used personally, for business, or for commerce.

Persistent Flow - Persistent flow is defined as the presence of flowing, pooled, or ponded water more than 72 hours after a measureable rainfall event of 0.1 inch or greater during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient.

Person - A person is defined as an individual, association, partnership, corporation, municipality, State or Federal agency, or an agent or employee thereof [40 CFR 122.2].

Point Source - Any discernible, confined, and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operations, landfill leachate collection systems, vessel, or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Pollutant - Any agent that may cause or contribute to the degradation of water quality such that a condition of pollution or contamination is created or aggravated.

Pollution - As defined in the Porter-Cologne Water Quality Control Act, pollution is "the alteration of the quality of the waters of the State by waste, to a degree that unreasonably affects the either of the following: 1) The waters for beneficial uses; or 2) Facilities that serve these beneficial uses." Pollution may include contamination.

Pollution Prevention - Pollution prevention is defined as practices and processes that reduce or eliminate the generation of pollutants, in contrast to source control BMPs, treatment control BMPs, or disposal.

~~Pre-Development~~ Pre-Project Runoff Conditions – Runoff conditions that exist~~ed~~ onsite immediately before ~~the existing development was constructed, or exists onsite before~~ planned development activities occur. Pre-project is not intended to be interpreted as that period before any human-induced land disturbance has occurred. 64 FR 68761.

Priority Development Projects - New development and redevelopment projects defined under Provision E.3.b of Order No. R9-2012-0011.

Properly Designed – Designed in accordance with the Copermittee's BMP Design Manual and/or any appropriate design requirements set forth by the Copermittee and based on widely accepted design criteria.

Public Education, Outreach and Participation – Programs to educate residents, businesses and visitors about the importance of water quality and water quality programs so that they will support local efforts and understand their role in protecting receiving waters. The Education and Outreach Program will increase knowledge and awareness, improve attitudes toward storm pollution prevention, and provide a foundation for changing behaviors that contribute to storm water pollution.

Rainy Season (aka Wet Season) –October 1 to April 30

Receiving Waters – Waters of the United States.

Receiving Water Limitations - Waste discharge requirements issued by the San Diego Water Board typically include both: (1) "Effluent Limitations" (or "Discharge Limitations") that specify the technology-based or water-quality-based effluent limitations; and (2) "Receiving Water Limitations" that specify the water quality objectives in the Basin Plan as well as any other limitations necessary to attain those objectives. In summary, the "Receiving Water Limitations" provision is the provision used to implement the requirements of CWA section 402(p)(3)(B).

Redevelopment - The creation, addition, and or replacement of impervious surface on an already developed site through construction or alteration of the existing footprint. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing existing roadways; resurfacing, cutting and reconfiguring of surface parking lots; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair.

Reporting Period – The period of information that is reported in the Annual Report. The reporting period consists of two components: 1) July 1 to June 30, consistent with the fiscal year, for the implementation of the jurisdictional runoff management programs, and 2) October 1 to September 30, consistent with the monitoring year for the monitoring and assessment programs. Together, these two time periods constitute the reporting year for the Annual Report due January 31 following the end of the monitoring year.

Restaurant – A facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812).

Retail gasoline outlet (RGO) – A business that sells automotive or truck fuel to the general public.

Retain –Keep or hold in a particular place, condition, or position without discharge to surface waters.

Retrofitting – – Storm water management practice put into place after development has occurred in watersheds where the practices previously did not exist or are ineffective. Retrofitting of developed areas is intended to improve water quality, protect downstream channels, reduce flooding, or meet other specific objectives. Retrofitting developed areas may include, but is not limited to replacing roofs with green roofs, disconnecting downspouts or impervious surfaces to drain to pervious surfaces, replacing impervious surfaces with pervious surfaces, installing rain barrels, installing rain gardens, and trash area enclosures.

Runoff - All flows in a storm water conveyance system that consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water including dry weather flows.

San Diego Water Board – As used in this document the term "San Diego Water Board" is synonymous with the term "Regional Board" as defined in Water Code section 13050(b) and is intended to refer to the California Regional Water Quality Control Board for the San Diego Region as specified in Water Code Section 13200.

Sediment - Soil, sand, and minerals washed from land into water. Sediment resulting from anthropogenic sources (i.e. human induced land disturbance activities) is considered a pollutant. This Order regulates only the discharges of sediment from anthropogenic sources and does not regulate naturally occurring sources of sediment. Sediment can destroy fish-nesting areas, clog animal habitats, and cloud waters so that sunlight does not reach aquatic plants.

Source Control BMP – ~~–~~Land use or site planning practices, or structural or nonstructural measures that aim to prevent runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and runoff.

Street, Road, Highway, Freeway and Driveway – Any paved impervious surface that is used for the transportation of automobiles, trucks, motorcycles, and other vehicles.

Storm Water – – Per 40 CFR 122.26(b)(13), means storm water runoff, snowmelt runoff and surface runoff and drainage. Surface runoff and drainage pertains to runoff and drainage resulting from precipitation events.

Stream, Channel, or Habitat Rehabilitation – – Measures or activities for the purpose of improving or restoring the environmental health (i.e. physical, chemical and biological integrity) of streams, channels, or river systems. Rehabilitation techniques may include, but are not limited to, riparian zone restoration, constructed wetlands, bank stabilization, channel reconfiguration, and daylighting drainage systems.

Structural BMPs - A subset of BMPs which detains, retains, filters, removes, or prevents the release of pollutants to surface waters from development projects in perpetuity, after construction of a project is completed.

Total Maximum Daily Load (TMDL) - The maximum amount of a pollutant that can be discharged into a water body from all sources (point and non-point) and still maintain water quality standards. Under CWA section 303(d), TMDLs must be developed for all water bodies that do not meet water quality standards after application of technology-based controls.

Toxicity - Adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). The water quality objectives for toxicity provided in the Basin Plan, state in part…"All waters shall be free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life….The survival of aquatic life in surface waters subjected to a waste discharge or other controllable water quality factors, shall not be less than that for the same water body in areas unaffected by the waste discharge".

Treatment Control BMP – Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

Unpaved Road – Any long, narrow stretch without pavement used for traveling by motor passenger vehicles between two or more points. Unpaved roads are generally constructed of dirt, gravel, aggregate or macadam and may be improved or unimproved.

Waste - As defined in CWC Section 13050(d), "waste includes sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal."

Article 2 of CCR Title 23, Chapter 15 (Chapter 15) contains a waste classification system that applies to solid and semi-solid waste, which cannot be discharged directly or indirectly to water of the state and which therefore must be discharged to land for treatment, storage, or disposal in accordance with Chapter 15. There are four classifications of waste (listed in order of highest to lowest threat to water quality): hazardous waste, designated waste, non-hazardous solid waste, and inert waste.

Water Quality Objective - Numerical or narrative limits on constituents or characteristics of water designated to protect designated beneficial uses of the water. [California Water Code Section 13050 (h)]. California's water quality objectives are established by the State and Regional Water Boards in the Water Quality Control Plans. Numeric or narrative limits for pollutants or characteristics of water designed to protect the beneficial uses of the water. In other words, a water quality objective is the maximum concentration of a pollutant that can exist in a receiving water and still generally ensure that the beneficial uses of the receiving water remain protected (i.e., not impaired). Since water quality objectives are designed specifically to protect the beneficial uses, when the objectives are violated the beneficial uses are, by definition, no longer protected and become impaired. This is a fundamental concept under the Porter Cologne Act. Equally fundamental is Porter Cologne's definition of pollution. A condition of pollution exists when the water quality needed to support designated beneficial uses has become unreasonably affected or impaired; in other words, when the water quality objectives have been violated. These underlying definitions (regarding beneficial use protection) are the reason why all waste discharge requirements implementing the federal NPDES regulations require compliance with water quality objectives. (Water quality objectives are also called water quality criteria in the CWA.)

Water Quality Standards - Water quality standards, as defined in Clean Water Act section 303(c) consist of the beneficial uses (e.g., swimming, fishing, municipal drinking water supply, etc.,) of a water body and criteria (referred to as water quality objectives in the California Water Code) necessary to protect those uses. Under the Water Code, the water boards establish beneficial uses and water quality objectives in water quality control or basin plans. Together with an anti-degradation policy, these beneficial uses and water quality objectives serve as water quality standards under the Clean Water Act. In Clean Water Act parlance, state beneficial uses are called "designated uses" and state water quality objectives are called "criteria." Throughout this Order, the relevant term is used depending on the statutory scheme.

Waters of the State - Any water, surface or underground, including saline waters within the boundaries of the State [CWC section 13050 (e)]. The definition of the Waters of the State is broader than that for the Waters of the United States in that all water in the State is considered to be a Waters of the State ~~regardless of circumstances or condition~~.

Waters of the United States - As defined in the 40 CFR 122.2, the Waters of the U.S. are defined as: "(a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate "wetlands;" (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition: (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial seas; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with the EPA."

Watershed - That geographical area which drains to a specified point on a water course, usually a confluence of streams or rivers (also known as drainage area, catchment, or river basin).

Wet Season (aka Rainy Season) –October 1 to April 30

Wet Weather – Weather is considered wet if there is a storm event of 0.1 inches and greater and the following 72 hours, unless otherwise defined by another regulatory mechanism.

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY ________________

I. COPERMITTEE INFORMATION		
Copermittee Name:		
Copermittee Primary Contact Name:		
Copermittee Primary Contact Information: Address: City: County: State: Zip: Telephone: Fax: Email:		
II. LEGAL AUTHORITY		
Has the Copermittee established adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 that complies with Order No. R9-2013-0001?	YES NO	☐ ☐
A Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative has certified that the Copermittee obtained and maintains adequate legal authority?	YES NO	☐ ☐
III. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM DOCUMENT UPDATE		
Was an update of the jurisdictional runoff management program document required or recommended by the San Diego Water Board?	YES NO	☐ ☐
If YES to the question above, did the Copermittee update its jurisdictional runoff management program document and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
IV. ILLICIT DISCHARGE DETECTION AND ELIMINATION PROGRAM		
Has the Copermittee implemented a program to actively detect and eliminate illicit discharges and connections to its MS4 that complies with Order No. R9-2013-0001?	YES NO	☐ ☐
Number of non-storm water discharges reported by the public		
Number of non-storm water discharges detected by Copermittee staff or contractors		
Number of non-storm water discharges investigated by the Copermittee		
Number of sources of non-storm water discharges identified		
Number of non-storm water discharges eliminated		
Number of sources of illicit discharges or connections identified		
Number of illicit discharges or connections eliminated		
Number of enforcement actions issued		
Number of escalated enforcement actions issued		
V. DEVELOPMENT PLANNING PROGRAM		
Has the Copermittee implemented a development planning program that complies with Order No. R9-2013-0001?	YES NO	☐ ☐
Was an update to the BMP Design Manual required or recommended by the San Diego Water Board?	YES NO	☐ ☐
If YES to the question above, did the Copermittee update its BMP Design Manual and make it available on the Regional Clearinghouse?	YES NO	☐ ☐
Number of proposed development projects in review		
Number of Priority Development Projects in review		
Number of Priority Development Projects approved		
Number of approved Priority Development Projects exempt from any BMP requirements		
Number of approved Priority Development Projects allowed alternative compliance		
Number of Priority Development Projects granted occupancy		
Number of completed Priority Development Projects in inventory		
Number of high priority Priority Development Project structural BMP inspections		
Number of Priority Development Project structural BMP violations		
Number of enforcement actions issued		
Number of escalated enforcement actions issued		

JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM
ANNUAL REPORT FORM
FY _______________

VI. CONSTRUCTION MANAGEMENT PROGRAM	
Has the Copermittee implemented a construction management program that complies with Order No. R9-2013-0001?	YES ☐ NO ☐
Number of construction sites in inventory	
Number of active construction sites in inventory	
Number of inactive construction sites in inventory	
Number of construction sites closed/completed during reporting period	
Number of construction site inspections	
Number of construction site violations	
Number of enforcement actions issued	
Number of escalated enforcement actions issued	

VII. EXISTING DEVELOPMENT MANAGEMENT PROGRAM				
Has the Copermittee implemented an existing development management program that complies with Order No. R9-2013-0001?				YES ☐ NO ☐
	Municipal	Commercial	Industrial	Residential
Number of facilities or areas in inventory				
Number of existing development inspections				
Number of follow-up inspections				
Number of violations				
Number of enforcement actions issued				
Number of escalated enforcement actions issued				

VIII. PUBLIC EDUCATION AND PARTICIPATION	
Has the Copermittee implemented a public education program component that complies with Order No. R9-2013-0001?	YES ☐ NO ☐
Has the Copermittee implemented a public participation program component that complies with Order No. R9-2013-0001?	YES ☐ NO ☐

IX. FISCAL ANALYSIS	
Has the Copermittee attached to this form a summary of its fiscal analysis that complies with Order No. R9-2013-0001?	YES ☐ NO ☐

X. CERTIFICATION

I [☐ Principal Executive Officer ☐ Ranking Elected Official ☐ Duly Authorized Representative] certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

SPECIFIC PROVISIONS FOR TOTAL MAXIMUM DAILY LOADS APPLICABLE TO ORDER NO. R9-2013-0001

These provisions implement Total Maximum Daily Loads (TMDLs), adopted by the San Diego Water Board and approved by USEPA under Clean Water Act section 303(c), which are applicable to discharges regulated under this Order. The provisions and schedules for implementation of the TMDLs described below must be incorporated into the Water Quality Improvement Plans, required pursuant to Provision B of this Order, for the specified Watershed Management Areas.

1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed
2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin
3. Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed
4. Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek
5. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay
6. Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)

1. Total Maximum Daily Load for Diazinon in Chollas Creek Watershed

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2002-0123

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	August 14, 2002
State Water Board Approval Date:	July 16, 2003
Office of Administrative Law Approval Date:	September 11, 2003
US EPA Approval Date:	November 3, 2003

(3) TMDL Effective Date: September 11, 2003

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Chollas Creek

(6) Responsible Copermittees: City of La Mesa, City of Lemon Grove, City of San Diego, County of San Diego, San Diego Unified Port District

b. FINAL TMDL COMPLIANCE REQUIREMENTS~~WATER QUALITY BASED EFFLUENT LIMITATIONS~~

Final TMDL compliance requirements ~~The WQBELs~~ for Chollas Creek consist of the following:

(1) Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the ~~violation~~ exceedance of the following receiving water limitations by the end of the compliance schedule under Specific Provision 1.a~~aa~~:

Table 1.1
Receiving Water Limitations as Concentrations in Chollas Creek

Constituent	Exposure Duration	Receiving Water Limitation	Averaging Period
Diazinon	Acute	0.16~~08~~ µg/L	1 hour
	Chronic	0.10~~05~~ µg/L	4 days

(2) Final Water Quality Based Effluent Limitations

~~Discharges from the MS4s must not contain concentrations that exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 1.c:~~
In the case that receiving water limitations are exceeded after the end of the compliance schedules under Specific Provision 1.b.(4), effluent limitations will be used to determine whether MS4 discharges are causing or contributing to exceedances of receiving water quality limitations. To demonstrate MS4 discharges are not causing or contributing to an exceedance of receiving

water quality limitations, MS4 discharges must meet the concentration-based effluent limitations in Table 1.2.

Table 1.2
Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Constituent	Exposure Duration	Effluent Limitation	Averaging Period
Diazinon	Acute	0.~~072~~ 144 µg/L	1 hour
	Chronic	0.~~045~~ 09 µg/L	4 days

1. Concentrations shall be determined on a flow-weighted basis across all outfalls within a jurisdiction, not outfall-by-outfall.

(3) Best Management Practices

The following BMPs for Chollas Creek must be incorporated into the Water Quality Improvement Plan for the San Diego Bay Watershed Management Area and implemented by the Responsible Copermittees:

(a) The Responsible Copermittees must implement BMPs to support the achievement of the WQBELs under Specific Provision 1.b for Chollas Creek.

(b) The Responsible Copermittees must implement the Diazinon Toxicity Control Plan and Diazinon Public Outreach/Education Program as described in the report titled, *Technical Report for Total Maximum Daily Load for Diazinon in Chollas Creek Watershed, San Diego County*, dated August 14, 2002, including subsequent modifications, in order to achieve the WQBELs under Specific Provision 1.b.

(c) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with Caltrans as possible.

(d) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the final receiving water limitations or final WQBELs under Specific Provision 1.b;

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow

the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

~~c. COMPLIANCE SCHEDULE~~

(4) Final Compliance Dates

The Responsible Copermittees are required to achieve their respective WLAs by December 31, 2010. The Responsible Copermittees must be in compliance with the final receiving water limitations or final WQBELs under Specific Provision 1.b.

(5) Final Compliance Determination

Compliance with final compliance requirements of Specific Provision 1.b may be demonstrated by a Responsible Copermittee via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water; OR

(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 1.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) There are no exceedances of the applicable effluent limitations under Specific Provision 1.b.(2) at the Responsible Copermittee's MS4 outfalls; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 1.b.(1) in the receiving water are due to loads from non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 1.b.(3).d.

~~d.~~c. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

(1) The Responsible Copermittees must implement the monitoring and assessment requirements issued under Investigation Order No. R9-2004-0277, *California Department of Transportation and San Diego Municipal*

Separate Storm Sewer System Copermittees Responsible for the Discharge of Diazinon into the Chollas Creek Watershed. The monitoring reports required under Investigation Order No. R9-2004-0277 must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

(2) The Responsible Copermittees must monitor the effluent of the MS4 outfalls for diazinon within the Chollas Creek watershed, and calculate or estimate the annual diazinon loads, in accordance with the requirements of Provisions D.2, D.4.b.(1), and D.4.b.(2) of this Order. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~e. COMPLIANCE DETERMINATION~~

~~Compliance with WQBELs of Specific Provision 1.b may be demonstrated via one of the following methods:~~

~~(1) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water;~~

~~(2) There are no exceedances of the applicable receiving water limitations under Specific Provision 1.b.(1) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls; OR~~

~~(3) There are no violations of the applicable effluent limitations under Specific Provision 1.b.(2) at the Responsible Copermittees' MS4 outfalls.~~

2. Total Maximum Daily Loads for Dissolved Copper in Shelter Island Yacht Basin

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2005-0019

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date: February 9, 2005
State Water Board Approval Date: September 22, 2005
Office of Administrative Law Approval Date: December 2, 2005
US EPA Approval Date: February 8, 2006

(3) TMDL Effective Date: December 2, 2005

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Shelter Island Yacht Basin

(6) Responsible Copermittee: City of San Diego~~t~~

b. FINAL TMDL COMPLIANCE REQUIREMENTS ~~WATER QUALITY BASED EFFLUENT LIMITATIONS~~

~~The WQBELs~~ Final TMDL compliance requirements for Shelter Island Yacht Basin consist of the following:

(1) Final Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the exceedance ~~violation~~ of the following receiving water limitations by the end of the compliance schedule under Specific Provision 2.~~c~~b(4):

Table 2.1
Receiving Water Limitations as Concentrations in Shelter Island Yacht Basin

Constituent	Exposure Duration	Receiving Water Limitation	Averaging Period
Dissolved Copper	Acute	4.8 x WER µg/L	1 hour
	Chronic	3.1 x WER µg/L	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(2) Final Water Quality Based Effluent Limitations

In the case that receiving water limitations are exceeded after the end of the compliance schedule under Specific Provision 2.b.(4), ~~Discharges from the MS4s must not contain pollutant loads that exceed the following~~ effluent limitations will be used to determine whether MS4 discharges are causing or contributing to exceedances of receiving water quality limitations~~by the end of the compliance schedule under Specific Provision 2.c:~~. To demonstrate MS4 discharges are not causing or contributing to exceedances of receiving water quality limitations, MS4 discharges must meet the load-based effluent limitations in Table 2.2.

Table 2.2
Effluent Limitations as Annual Loads in MS4 Discharges to Shelter Island Yacht Basin

Constituent	Effluent Limitation
Dissolved Copper	30 x WER kg/yr

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(3) Final Best Management Practices

~~The Responsible Copermittee must implement BMPs to support the achievement of the WQBELs under Specific Provision 2.b for Shelter Island Yacht Basin~~

(a) The Responsible Copermittee must implement BMPs to support the achievement of the final receiving water limitations or final WQBELs under Specific Provision 2.b.

(b) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with other responsible parties as possible.

(c) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the final receiving water limitations or final WQBELs under Specific Provision 2.b;

(3) The submitted schedule as outlined in Provision B.3 provides sufficient

detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

(4) Final Compliance Schedule

The Responsible Copermittee is required to achieve the MS4 WLA by December 2, 2005. The Responsible Copermittee must be in compliance with the final receiving water limitations or final WQBELs under Specific Provision 2.b.

(5) Final Compliance Determination

Compliance with final compliance requirements of Specific Provision 2.b.(1) may be demonstrated by a Responsible Copermittee via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR

(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 1.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) There are no exceedances of the applicable effluent limitations under Specific Provision 2.b.(2) at the Responsible Copermittee's MS4 outfalls; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 2.b.(1) in the receiving water are due to loads from non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 2.b.(3).c.

c. Specific Monitoring and Assessment Requirements

The Responsible Copermittee must monitor the effluent of its MS4 outfalls for dissolved copper, and calculate or estimate the monthly and annual dissolved copper loads, in accordance with the requirements of Provisions D.2, D.4.b.(1), and D.4.(b)(2)of this Order. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~d. COMPLIANCE DETERMINATION~~

~~Compliance with WQBELs of Specific Provision 2.b may be demonstrated via one of the following methods:~~

~~(1) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water;~~

~~(2) There are no exceedances of the applicable receiving water limitations under Specific Provision 2.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR~~

~~(3) There are no violations of the applicable effluent limitations under Specific Provision 2.b.(2) at the Responsible Copermittee's MS4 outfalls.~~

3. Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2005-0036

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	February 9, 2005
State Water Board Approval Date:	November 16, 2005
Office of Administrative Law Approval Date:	February 1, 2006
US EPA Approval Date:	March 22, 2006

(3) TMDL Effective Date: February 1, 2006

(4) Watershed Management Area: Santa Margarita River

(5) Water Body: Rainbow Creek

(6) Responsible Copermittee: County of San Diego

b. FINAL TMDL COMPLIANCE REQUIREMENTS~~WATER QUALITY BASED EFFLUENT LIMITATIONS~~

~~The WQBELs~~ Final TMDL compliance requirements for Rainbow Creek consist of the following:

(1) Final Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the ~~violation~~ exceedance of the following receiving water limitations by the end of the compliance schedule under Specific Provision 3.b(4)~~c.(1)~~:

Table 3.1
Receiving Water Limitations as Concentrations in Rainbow Creek

Constituent	Receiving Water Limitation
Nitrate (as N)	10 mg/L
Total Nitrogen	1 mg/L
Total Phosphorus	0.1 mg/L

(2) Final Water Quality Based Effluent Limitations

(a) In the case that receiving water limitations are exceeded after the end of the compliance schedules under Specific Provision 3.b.(4), ~~Discharges from the MS4s must not contain concentrations that exceed the following~~ effluent limitations will be used to determine whether MS4 discharges are causing or contributing to exceedances of receiving water quality limitations. ~~by the end of the compliance schedule under Specific Provision 3.c.(1):~~ To demonstrate MS4 discharges are not causing or contributing to exceedances of receiving water quality limitations, MS4 discharges must meet either the concentration-based effluent limitations in Table 3.2 or the load-based effluent limitations in Table 3.3.

Table 3.2
Effluent Limitations as Concentrations in MS4 Discharges to Rainbow Creek

Constituent	Effluent Limitation
Nitrate (as N)	10 mg/L
Total Nitrogen	1 mg/L
Total Phosphorus	0.1 mg/L

1. Concentrations shall be determined on a flow-weighted basis across all outfalls within a jurisdiction, not outfall-by-outfall.

~~(b) Pollutant loads from given land uses discharging to and from the MS4s must not exceed the following effluent limitations by the end of the compliance schedule under Specific Provision 3.c.(1):~~

Table 3.3
Effluent Limitations as Annual Loads in MS4 Discharges to Rainbow Creek

Land Use	Total N	Total P
Commercial nurseries	116 kg/yr	3 kg/yr
Park	3 kg/yr	0.1 kg/yr
Residential areas	149 kg/yr	12 kg/yr
Urban areas	27 kg/yr	6 kg/yr

~~Interim effluent limitations expressed as pollutant loads are given in the compliance schedule under Specific Provision 3.0.~~

(3) Final Best Management Practices

(a) The Responsible Copermittee must implement BMPs to support the achievement of the final receiving water limitations or final WQBELs under Specific Provision 3.b for Rainbow Creek.

(b) The Responsible Copermittee should coordinate any BMPs implemented to address this TMDL with Caltrans and other sources as possible.

(c) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the final receiving water limitations or final WQBELs under Specific Provision 3.b;

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

~~c. COMPLIANCE SCHEDULE~~

(5) Final Compliance Date

The Responsible Copermittee must be in compliance with the final receiving water limitations or final WQBELs under Specific Provision 3.b, by December 31, 2021.

(6) Final Compliance Determination

Compliance with final compliance requirements of Specific Provision 3.b.(1) may be demonstrated by a Responsible Copermittee via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR

(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 3.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) There are no exceedances of either the applicable numeric or load based effluent limitations under Specific Provision 3.b.(2) at the Responsible Copermittee's MS4 outfalls; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 3.b.(1).a in the receiving water are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee is using its legal authority to reduce nutrient discharges from the land uses identified under Specific Provision 3.b.(2).b to the maximum extent practicable; OR

(f) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 3.b.(3).d.

c. INTERIM COMPLIANCE REQUIREMENTS

~~(6) Interim Compliance Requirements~~

Interim TMDL compliance requirements consist of the following:

(1) Interim Water Quality Based Effluent Limitations

Discharges from the MS4s must not exceed the interim WQBELs presented in

Table 3.4 by the end of the interim compliance schedule as presented in Table 3.4.

Table 3.4
Interim Effluent Limitations as Annual Loads in
MS4 Discharges from Specific Land Uses to Rainbow Creek

Land Use	Total N Interim Effluent Limitations (kg/yr)			Total P Interim Effluent Limitations (kg/yr)		
	Interim Compliance Date			Interim Compliance Date		
	2009	2013	2017	2009	2013	2017
Commercial nurseries	390	299	196	20	16	10
Park	5	3	3	0.15	0.10	0.10
Residential areas	507	390	260	99	74	47
Urban areas	40	27	27	9	6	6

(2) Interim Best Management Practices

(a) The Responsible Copermittee must implement BMPs to support the achievement interim effluent limitations under Specific Provision 3.c.(1).

(b) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with other responsible parties as possible.

(c) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the interim load requirements under Specific Provision 3.c.(1);

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

(3) Interim Compliance Determination

Compliance with interim compliance requirements of Specific Provision 3.c may be demonstrated via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR

(b) There are no exceedances of the applicable final receiving limitations under Specific Provision 3.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) The Responsible Copermittee demonstrates applicable interim WQBELs under Specific Provision 3.c.(1) have been achieved; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 3.b.(1) are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee is using its legal authority to reduce nutrient discharges from the land uses identified under Specific Provision 3.b.(2).(b) to the maximum extent practicable; OR

(f) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan, that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 3.c.(2).c.

d. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

The Responsible Copermittee must implement the Sampling and Analysis Plan for Rainbow Creek Nutrient Reduction TMDL Implementation Water Quality Monitoring, dated January 2010. The results of any monitoring conducted during the reporting period, and assessment of whether the interim and final WQBELs have been achieved must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~e. COMPLIANCE DETERMINATION~~

~~(1) Compliance with interim compliance requirements of Specific Provision 3.c.(2) may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 3.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls;~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 3.b.(2)(a) at the Responsible Copermittee's MS4 outfalls;~~

~~(d) The pollutant loads from given land uses discharging to and from the MS4s do not exceed the applicable effluent limitations under Specific Provision 3.b.(2)(b); OR~~

~~(e) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan, accepted by the San Diego Water Board, which provides reasonable assurance that the interim compliance requirements will be achieved by the interim compliance dates.~~

~~(2) Compliance with WQBELs of Specific Provision 3.b may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 3.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls;~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 3.b.(2)(a) at the Responsible Copermittee's MS4 outfalls; OR~~

~~(d) The pollutant loads from given land uses discharging to and from the MS4s do not exceed the applicable effluent limitations under Specific Provision 3.b.(2)(b).~~

4. Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2007-0043

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date: June 13, 2007
State Water Board Approval Date: July 15, 2008
Office of Administrative Law Approval Date: October 22, 2008
US EPA Approval Date: December 18, 2008

(3) TMDL Effective Date: October 22, 2008

(4) Watershed Management Area: San Diego Bay

(5) Water Body: Chollas Creek

(6) Responsible Copermittees: City of La Mesa, City of Lemon Grove, City of San Diego, County of San Diego, San Diego Unified Port District

b. FINAL TMDL COMPLIANCE REQUIREMENTS~~WATER QUALITY BASED EFFLUENT LIMITATIONS~~

~~The WQBELs~~ Final TMDL compliance requirements for Chollas Creek consist of the following:

(1) Final Receiving Water Limitations

Discharges from the MS4s must not cause or contribute to the ~~violation~~ exceedance of the following receiving water limitations by the end of the compliance schedule under Specific Provision 4.b.(4)~~c.(1)~~:

Table 4.1
Receiving Water Limitations as Concentrations in Chollas Creek

Constituent	Exposure Duration	Receiving Water Limitation (µg/L)	Averaging Period
Dissolved Copper	Acute	$(0.96) \times e^{[0.9422 \times \ln(\text{hardness}) - 1.700]} \times \text{WER}^*$	1 hour
	Chronic	$(0.96) \times e^{[0.8545 \times \ln(\text{hardness}) - 1.702]} \times \text{WER}^*$	4 days
Dissolved Lead	Acute	$[1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 1.460]} \times \text{WER}^*$	1 hour
	Chronic	$[1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 4.705]} \times \text{WER}^*$	4 days
Dissolved Zinc	Acute	$(0.978) \times e^{[0.8473 \times \ln(\text{hardness}) + 0.884]} \times \text{WER}^*$	1 hour
	Chronic	$(0.986) \times e^{[0.8473 \times \ln (\text{hardness}) + 0.884]} \times \text{WER}^*$	4 days

Notes:

* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(2) Final Water Quality Based Effluent Limitations

In the case that receiving water limitations are exceeded after the end of the compliance schedules under Specific Provision 4.b.(4), ~~Discharges from the MS4s must not contain pollutant loads that exceed the following~~ effluent limitations will be used to determine whether MS4 discharges are causing or contributing to exceedances of receiving water quality limitations. ~~by the end of the compliance schedule under Specific Provision 4.c.(1):~~ To demonstrate MS4 discharges are not causing or contributing to exceedances of receiving water quality limitations, MS4 discharges must meet the concentration-based effluent limitations in Table 4.2.

Table 4.2
Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
Dissolved Copper	Acute	$90\% \times (0.96) \times e^{[0.9422 \times \ln(\text{hardness}) - 1.700]} \times \text{WER*}$	1 hour
	Chronic	$90\% \times (0.96) \times e^{[0.8545 \times \ln(\text{hardness}) - 1.702]} \times \text{WER*}$	4 days
Dissolved Lead	Acute	$90\% \times [1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 1.460]} \times \text{WER*}$	1 hour
	Chronic	$90\% \times [1.46203 - 0.145712 \times \ln(\text{hardness})] \times e^{[1.273 \times \ln(\text{hardness}) - 4.705]} \times \text{WER*}$	4 days
Dissolved Zinc	Acute	$90\% \times (0.978) \times e^{[0.8473 \times \ln(\text{hardness}) + 0.884]} \times \text{WER*}$	1 hour
	Chronic	$90\% \times (0.986) \times e^{[0.8473 \times \ln(\text{hardness}) + 0.884]} \times \text{WER*}$	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(3) Final Best Management Practices

(a) The Responsible Copermittees must implement BMPs to support the achievement of the final receiving water limitations or final WQBELs under Specific Provision 4.b.(1) for Chollas Creek.

(b) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with Caltrans and the U.S. Navy as possible.

(c) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the

discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the final receiving water limitations or final WQBELs under Specific Provision 4.b;

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

~~c. COMPLIANCE SCHEDULE~~

(4) Final WLA Compliance Date

The Responsible Copermittees ~~are required to achieve the WLA, thus~~ must be in compliance with the final receiving water limitation or final WQBELs under Specific Provision 4.b, by October 22, 2028.

(5) Final Compliance Determination

Compliance with final compliance requirements of Specific Provision 4.b.(1) may be demonstrated by a Responsible Copermittee via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR

(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 4.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) There are no exceedances of the applicable effluent limitations under Specific Provision 4.b.(2) at the Responsible Copermittee's MS4 outfalls; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 4.b.(1) in the receiving water are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing an Enhanced Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 4.b.(3).c.

~~d.~~c. INTERIM COMPLIANCE REQUIREMENTS

Interim TMDL compliance requirements consist of the following:

(1) Interim Water Quality Based Effluent Limitations

Discharges from the MS4s must not exceed the interim WQBELs by the interim compliance schedule under Specific Provision 4.c.(3). ~~The Responsible Copermittee must comply with the following interim WQBELs by the interim compliance date:~~

Table 4.3
Interim Effluent Limitations as Concentrations in MS4 Discharges to Chollas Creek

Interim Compliance Date	Constituent	Exposure Duration	Effluent Limitation (µg/L)	Averaging Period
October 22, 2018	Dissolved Copper	Acute	1.2 x 90% x (0.96) x $e^{[0.9422 \times \ln(\text{hardness}) - 1.700]}$ x WER*	1 hour
		Chronic	1.2 x 90% x (0.96) x $e^{[0.8545 \times \ln(\text{hardness}) - 1.702]}$ x WER*	4 days
	Dissolved Lead	Acute	1.2 x 90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(\text{hardness}) - 1.460]}$ x WER*	1 hour
		Chronic	1.2 x 90% x [1.46203 – 0.145712 x ln(hardness)] x $e^{[1.273 \times \ln(\text{hardness}) - 4.705]}$ x WER*	4 days
	Dissolved Zinc	Acute	1.2 x 90% x (0.978) x $e^{[0.8473 \times \ln(\text{hardness}) + 0.884]}$ x WER*	1 hour
		Chronic	1.2 x 90% x (0.986) x $e^{[0.8473 \times \ln(\text{hardness}) + 0.884]}$ x WER*	4 days

Notes:
* The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER.

(2) Interim Best Management Practices

(a) The Responsible Copermittee must implement BMPs to support the achievement interim effluent limitations under Specific Provision 4.c.(1).

(b) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with other responsible parties as possible.

(c) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the interim WQBELs under Specific Provision 4.c.(1);

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

(3) Interim Compliance Date

The Responsible Copermittees must be in compliance with the interim WQBELs under Specific Provision 4.c, by October 22, 2018.

(4) Interim Compliance Determination

Compliance with interim compliance requirements of Specific Provision 4.c may be demonstrated via by a Responsible Copermittee one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR

(b) There are no exceedances of the applicable final receiving limitations under Specific Provision 4.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) The Responsible Copermittee demonstrates applicable interim WQBELs under Specific Provision 4.c.(1) have been achieved; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 4.b.(1) are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan, that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 4.c.(2).c.

~~c.~~d. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

(1) The Responsible Copermittees must implement the monitoring and assessment requirements issued under Investigation Order No. R9-2004-0277, *California Department of Transportation and San Diego Municipal Separate Storm Sewer System Copermittees Responsible for the Discharge of Diazinon into the Chollas Creek Watershed*, when it is amended to include monitoring requirements for the Total Maximum Daily Loads for Dissolved Copper, Lead, and Zinc in Chollas Creek. The monitoring reports required under Investigation Order No. R9-2004-0277 must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

(2) The Responsible Copermittees must monitor the effluent of the MS4 outfalls discharging to Chollas Creek for dissolved copper, lead, and zinc, and calculate or estimate the monthly and annual dissolved copper, lead, and zinc loads, in accordance with the requirements of Provisions D.2, D.4.b.(1), and D.4.b.(2)of this Order. The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~f. COMPLIANCE DETERMINATION~~

~~(1) Compliance with interim compliance requirements of Specific Provision 4.c.(2) may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 4.b.(1) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls;~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 4.b.(2) at the Responsible Copermittees' MS4 outfalls; OR~~

~~(d) The Responsible Copermittees have submitted and is fully implementing a Water Quality Improvement Plan, accepted by the San Diego Water Board, which provides reasonable assurance that the interim compliance requirements will be achieved by the interim compliance dates.~~

~~(2) Compliance with WQBELs of Specific Provision 4.b may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 4.b.(1) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls; OR~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 4.b.(2) at the Responsible Copermittees' MS4 outfalls.~~

5. Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2008-0027

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	June 11, 2008
State Water Board Approval Date:	June 16, 2009
Office of Administrative Law Approval Date:	September 15, 2009
US EPA Approval Date:	October 26, 2009

(3) TMDL Effective Date: September 15, 2009

(4) Watershed Management Areas: See Table 5.0

(5) Water Bodies: See Table 5.0

(6) Responsible Copermittees: See Table 5.0

Table 5.0
Applicability of Total Maximum Daily Loads for Indicator Bacteria
Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay

Watershed Management Area	Water Body	Segment or Area	Responsible Copermittees
South Orange County	Dana Point Harbor	Baby Beach	-City of Dana Point -County of Orange
San Diego Bay	San Diego Bay	Shelter Island Shoreline Park	- San Diego Unified Port District

b. FINAL TMDL COMPLIANCE REQUIREMENTS ~~WATER QUALITY BASED EFFLUENT LIMITATIONS~~

~~The WQBELs~~ Final TMDL compliance requirements for segments or areas of the water bodies listed in Table 5.0 consist of the following:

(1) Final Receiving Water Limitations

(a) Discharges from the MS4s must not cause or contribute to the ~~violation~~ exceedance of the following receiving water limitations by the end of the compliance schedules under Specific Provisions 5.c.(1)(a)~~(u)~~ and 5.c.(b):

Table 5.1
Receiving Water Limitations as Bacteria Densities in the Water Body

Constituent	Receiving Water Limitations: Single Sample Maximum[1,2]	Receiving Water Limitations: 30-Day Geometric Mean[2]
Total Coliform	10,000 MPN/100mL	1,000 MPN/100mL
Fecal Coliform	400 MPN/100mL	200 MPN/100mL
Enterococcus	104 MPN/100mL	35 MPN/100mL

Notes:
1. During wet weather days, only the single sample maximum receiving water limitations are required to be achieved.
2. During dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved.

~~(b) If the above receiving water limitations are not met in the receiving water, the Responsible Copermittees must demonstrate that the discharges from the MS4s are not causing or contributing to the exceedance of receiving water limitations.~~

(2) Final Water Quality Based Effluent Limitations

In the case that receiving water limitations are exceeded after the end of the compliance schedules under Specific Provision 5.b.4, ~~Discharges from the MS4s must not contain densities that exceed the following~~ effluent limitations will be used to determine whether MS4 discharges are causing or contributing to exceedances of receiving water quality limitations. ~~by the end of the compliance schedules under Specific Provisions 5.c.(1)(a) and 5.c.(2) to demonstrate the discharge is not causing or contributing to a violation of receiving water quality standards:~~ To demonstrate MS4 discharges are not causing or contributing to exceedances of receiving water quality limitations, MS4 discharges must meet either the concentration-based effluent limitations in Table 5.2a or the load-based effluent limitations in Table 5.2b.

Table 5.2
Effluent Limitations as Bacteria Densities in MS4 Discharges to the Water Body

Constituent	Concentration-Based Effluent Limitations: Single Sample Maximum[1,2]	Concentration-Based Effluent Limitations: 30-Day Geometric Mean[2]
Total Coliform	10,000 MPN/100mL	1,000 MPN/100mL
Fecal Coliform	400 MPN/100mL	200 MPN/100mL
Enterococcus	104 MPN/100mL	35 MPN/100mL

Notes:
1. During wet weather days, only the single sample maximum effluent limitations are required to be achieved.
2. During dry weather days, the single sample maximum and 30-day geometric mean effluent limitations are required to be achieved.
3. Concentrations shall be determined on a flow-weighted basis across all outfalls within a jurisdiction, not outfall-by-outfall

~~Interim effluent limitations expressed as pollutant loads are given in the compliance schedule under Specific Provision 5.c.~~

Table 5.2b
Effluent Limitations as Allowable Loading Rates for MS4 Discharges to the Water Body

		Load-based Effluent Limitations Expressed as Required % Load Reduction by MS4s					
		Dry Weather			Wet Weather		
Waterbody	Shoreline Segment/Area	Total Coliform	Fecal Coliform	*Entero-coccus*	Total Coliform	Fecal Coliform	*Entero-coccus*
Dana Point Harbor	Baby Beach	90.4% reduction	82.7% reduction	96.2% reduction	0% reduction	0% reduction	62.2% reduction
San Diego Bay	Shelter Island Shoreline Park	0% reduction	0% reduction	0% reduction	0% reduction	0% reduction	0% reduction

(3) Final Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 5.0 must incorporate the Bacteria Load Reduction Plan (BLRP) required to be developed pursuant to Resolution No. R9-2008-0027.

(b) The Responsible Copermittee must implement BMPs to support the achievement of the final receiving water limitations or final WQBELs under Specific Provision 5.0 for the segments or areas of the water bodies listed in Table 5.0

(c) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the final receiving water limitations or final WQBELs under Specific Provision 5.b;

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

~~c. COMPLIANCE SCHEDULE~~

(4) Final Compliance Dates

(a) Baby Beach in Dana Point Harbor

~~(b) WLA Compliance Dates~~

The Responsible Copermittees for MS4 discharges to Baby Beach ~~are~~

~~required to achieve the WLA, thus~~ must be in compliance with the final receiving water limitations or final WQBELs under Specific Provision 5.b~~0,~~ according to the following compliance schedule:

Table 5.3
Compliance Schedule Dates to Achieve Baby Beach WLAs

Constituent	Dry Weather WLA Compliance Date	Wet Weather WLA Compliance Date
Total Coliform	September 15, 2014	September 15, 2009
Fecal Coliform		September 15, 2009
Enterococcus		September 15, 2019

~~(c) Interim Compliance Requirements~~

~~The Responsible Copermittees for MS4 discharges to Baby Beach must comply with the following interim WQBELs by the interim compliance date:~~

~~**Table 5.4**~~
~~*Interim Effluent Limitations as Loads in MS4 Discharges to Baby Beach*~~

~~Constituent~~	~~Interim Compliance Date~~	~~Dry Weather Interim Effluent Limitation~~	~~Wet Weather Interim Effluent Limitation~~
~~Total Coliform~~	~~September 15, 2012~~	~~4.93×10^{9} MPN/day~~	~~NA*~~
~~Fecal Coliform~~	~~September 15, 2012~~	~~0.59×10^{9} MPN/day~~	~~NA*~~
~~*Enterococcus*~~	~~September 15, 2012~~	~~0.42×10^{9} MPN/day~~	~~NA**~~
	~~September 15, 2016~~	~~NA*~~	~~207×10^{9} MPN/30days~~

~~Notes:~~
~~* The WQBELs under Specific Provision 5.b must already be achieved by the given interim compliance date.~~
~~** There is no corresponding interim WQBEL for the given interim compliance date.~~

~~(d)~~(b) Shelter Island Shoreline Park in San Diego Bay

The Responsible Copermittee for MS4 discharges to Shelter Island Shoreline Park ~~is required to achieve the WLA, thus~~ must be in compliance with the final receiving water limitations or final WQBELs under Specific Provision 5.b~~0~~, by December 31, 2012.

(5) Final Compliance Determination

Compliance with final compliance requirements of Specific Provision 5.b may be demonstrated a Responsible Copermittee via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR

(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 5.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) There are no exceedances of the applicable effluent limitations under Specific Provision 5.b.(2) at the Responsible Copermittee's MS4 outfalls; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 5.b.(1)(a) in the receiving water are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing an Enhanced Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 5.b.(3).c.

c. INTERIM COMPLIANCE REQUIREMENTS

Interim TMDL compliance requirements consist of the following:

(1) Interim Water Quality Based Effluent Limitations and Schedule

The Responsible Copermittees for MS4 discharges to Baby Beach must comply with the following interim WQBELs by the interim compliance date:

Table 5.4
Interim Effluent Limitations as Loads in MS4 Discharges to Baby Beach

Constituent	Interim Compliance Date	Dry Weather Interim Effluent Limitation	Wet Weather Interim Effluent Limitation
Total Coliform	September 15, 2012	4.93×10^9 MPN/day	NA*
Fecal Coliform	September 15, 2012	0.59×10^9 MPN/day	NA*
Enterococcus	September 15, 2012	0.42×10^9 MPN/day	NA**
	September 15, 2016	NA*	207×10^9 MPN/30days

Notes:
* The WQBELs under Specific Provision 5.b must already be achieved by the given interim compliance date.
** There is no corresponding interim WQBEL for the given interim compliance date.

(2) Interim Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas must incorporate the Bacteria Load Reduction Plan (BLRP) required to be developed pursuant to Resolution No. R9-2008-0027.

(b) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with Caltrans and owners/operators of small MS4s as possible.

(c) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the interim effluent limitations under Specific Provision 5.c.(1);

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

(3) Interim Compliance Determination

Compliance with interim compliance requirements of Specific Provision 5.c may be demonstrated by a Responsible Copermittee via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water; OR

(b) There are no exceedances of the applicable final receiving limitations under Specific Provision 5.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls; OR

(c) The Responsible Copermittee demonstrates applicable interim WQBELs under Specific Provision 5.c.(1) have been achieved; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 5.b.(1) are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan, that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 5.c.(2).c.

d. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

(1) Monitoring Stations

Monitoring locations should consist of, at a minimum, the same locations used to collect data required pursuant to Order Nos. R9-2007-0001 and R9-2009-0002, and beach monitoring for Health and Safety Code section 115880.[35] If exceedances of the applicable interim or final receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations must also be used to demonstrate that the bacteria loads from the identified anthropogenic sources have been addressed and are no longer causing exceedances in the receiving waters.

(2) Monitoring Procedures

(a) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly. Dry weather samples collected from additional monitoring stations established to identify sources must be collected at an appropriate frequency to demonstrate bacteria loads from the identified anthropogenic sources have been addressed and are no longer causing exceedances in the receiving waters.

(b) The Responsible Copermittees must collect wet weather monitoring samples within the first 24 hours of the first storm event[36] of the rainy season (i.e. October 1 through April 30). Wet weather samples collected from receiving water stations and any additional monitoring stations established to identify sources must be collected at an appropriate frequency to demonstrate bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters.

(c) Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.

(3) Assessment and Reporting Requirements

(a) The Responsible Copermittees must analyze the dry weather and wet weather monitoring data to assess whether the interim and final WQBELs have been achieved.

---

[35] Commonly referred to as AB 411 monitoring
[36] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].

(b) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~e. COMPLIANCE DETERMINATION~~

~~(1) Compliance with interim compliance requirements of Specific Provision 5.c.(1)(b) may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 5.b.(1)(a) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls;~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 5.b.(2) at the Responsible Copermittees' MS4 outfalls;~~

~~(d) The pollutant loads discharging from the Responsible Copermittees' MS4 outfalls do not exceed the applicable effluent limitations under Specific Provision 5.c.(1)(b);~~

~~(e) The Responsible Copermittees can demonstrate that exceedances of the applicable receiving water limitations under Specific Provision 5.b.(1)(a) in the receiving water are due to loads from natural sources, AND pollutant loads from the Copermittees' MS4 are not causing or contributing to the exceedances; OR~~

~~(f) The Responsible Copermittees have submitted and are fully implementing a Water Quality Improvement Plan, accepted by the San Diego Water Board, which provides reasonable assurance that the interim compliance requirements will be achieved by the interim compliance dates.~~

~~(2) Compliance with WQBELs of Specific Provision 5.b may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 5.b.(1)(a) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls;~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 5.b.(2) at the Responsible Copermittees' MS4 outfalls;~~

~~(d) The pollutant loads discharging from the Responsible Copermittees' MS4 outfalls do not exceed the applicable effluent limitations under Specific Provision 5.c.(1)(b); OR~~

~~(e) The Responsible Copermittees can demonstrate that exceedances of the applicable receiving water limitations under Specific Provision 5.b.(1)(a) in the receiving water are due to loads from natural sources, AND pollutant loads from the Copermittees' MS4 are not causing or contributing to the exceedances.~~

6. Revised Total Maximum Daily Loads for Indicator Bacteria, Project I – Twenty Beaches and Creeks in the San Diego Region (Including Tecolote Creek)

a. APPLICABILITY

(1) TMDL Basin Plan Amendment: Resolution No. R9-2010-0001

(2) TMDL Adoption and Approval Dates:

San Diego Water Board Adoption Date:	February 10, 2010
State Water Board Approval Date:	December 14, 2010
Office of Administrative Law Approval Date:	April 4, 2011
US EPA Approval Date:	June 22, 2011

(3) TMDL Effective Date: April 4, 2011

(4) Watershed Management Areas: See Table 6.0

(5) Water Bodies: See Table 6.0; Consistent with Basin Plan Amendment (Resolution No. R9-2010-0001, p. A-2); specific beach segments from some of the Pacific Ocean shorelines listed in Table 6.0 have been delisted from the 2008 (sic 2010) 303(d) list that was approved by the San Diego Board on December 16, 2009, and therefore are not subject to the requirements of Attachment E as long as monitoring data continues to support compliance with water quality standards.

(6) Responsible Copermittees: See Table 6.0

Table 6.0
Applicability of Total Maximum Daily Loads for Indicator Bacteria
Project I - Twenty Beaches and Creeks in the San Diego Region (including Tecolote Creek)

Watershed Management Area	Water Body	Segment or Area	Responsible Copermittees
South Orange County	Pacific Ocean Shoreline	Cameo Cove at Irvine Cove Drive – Riviera Way	-City of Laguna Beach -County of Orange -Orange County Flood Control District

	San Diego River	lower 6 miles	-City of El Cajon -City of La Mesa -City of San Diego -City of Santee -County of San Diego
	Pacific Ocean Shoreline	at San Diego River mouth at Dog Beach	
San Diego Bay	Chollas Creek	lower 1.2 miles	-City of La Mesa -City of Lemon Grove -City of San Diego -County of San Diego - San Diego Unified Port District

b. FINAL TMDL COMPLIANCE REQUIREMENTS ~~WATER QUALITY BASED EFFLUENT LIMITATIONS~~

~~The WQBELs~~ Final TMDL compliance requirements for segments or areas of the water bodies listed in Table 6.0 consist of the following:

(1) Receiving Water Limitations

(a) Discharges from the MS4s must not cause or contribute to the exceedance ~~violation~~ of the following receiving water limitations by the end of the compliance schedules under Specific Provision 6.c.(5)~~(1)~~:

Table 6.1
Receiving Water Limitations as Bacteria Densities and Allowable Exceedance Frequencies in the Water Body

Constituent	Receiving Water Limitations			
	Single Sample Maximum[1,2] (MPN/100mL)	Single Sample Maximum Allowable Exceedance Frequency[3]	30-Day Geometric Mean[2] (MPN/100mL)	30-Day Geometric Mean Allowable Exceedance Frequency
Total Coliform	10,000	22% / 0%	1,000	0%
Fecal Coliform	400	22% / 0%	200	0%
Enterococcus	104[4] / 61[5]	22% / 0%	35[4] / 33[5]	0%

Notes:
1. During wet weather days, only the single sample maximum receiving water limitations are required to be achieved.
2. During dry weather days, the single sample maximum and 30-day geometric mean receiving water limitations are required to be achieved.
3. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days. The 0% single sample maximum allowable exceedance frequency applies to dry weather days.
4. This *Enterococcus* receiving water limitation applies to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.
5. This *Enterococcus* receiving water limitations applies to segments or areas of creeks or creek mouths listed in Table 6.0.

~~Interim receiving water limitations expressed as allowable exceedance frequencies are given in the compliance schedule under Specific Provision 6.c.~~

(b) If the above receiving water limitations are not met in the receiving water, the Responsible Copermittees must demonstrate that the discharges from the MS4s are not causing or contributing to the exceedance ~~violation~~ of receiving water limitations. The Copermittee must provide data that demonstrate the discharges from the MS4s are meeting the effluent limitations under Specific Provision 6.b.(2).

(2) Final Water Quality Based Effluent Limitations

In the case that receiving water limitations are exceeded after the end of the compliance schedules under Specific Provision 6.b.5, ~~Discharges from the MS4s must not contain densities that exceed the following~~ effluent limitations will be used to determine whether MS4 discharges are causing or contributing to exceedances of receiving water quality limitations. ~~by the end of the compliance schedules under Specific Provision 6.c.(1) to demonstrate the discharge is not causing or contributing to a violation of receiving water quality standards:~~ To demonstrate MS4 the discharges are not causing or contributing to a exceedance of receiving water quality limitations, MS4 discharges must meet either the concentration-based effluent limitations in Table 6.2a or the load-based effluent limitations in Table 6.2b.

~~Table 6.2~~
Table 6.2a
Effluent Limitations as Bacteria Densities and Allowable Exceedance Frequencies in MS4 Discharges to the Water Body

	Concentration-based Effluent Limitations[6]			
Constituent	**Single Sample Maximum[1,2] (MPN/100mL)**	**Single Sample Maximum Allowable Exceedance Frequency[3]**	**30-Day Geometric Mean[2] (MPN/100mL)**	**30-Day Geometric Mean Allowable Exceedance Frequency**
Total Coliform	10,000	22% / 0%	1,000	0%
Fecal Coliform	400	22% / 0%	200	0%
Enterococcus	104[4] / 61[5]	22% / 0%	35[4] / 33[5]	0%

Notes:
1. During wet weather days, only the single sample maximum effluent limitations are required to be achieved.
2. During dry weather days, the single sample maximum and 30-day geometric mean effluent limitations are required to be achieved.
3. The 22% single sample maximum allowable exceedance frequency only applies to wet weather days. The 0% single sample maximum allowable exceedance frequency applies to dry weather days
4. This *Enterococcus* effluent limitation and all total coliform limitations ~~applies~~ apply only to MS4 discharges to segments of areas of Pacific Ocean Shoreline listed in Table 6.0.
5. This *Enterococcus* effluent limitation applies only to MS4 discharges to segments or areas of creeks or creek mouths listed in Table 6.0.
6. Concentrations shall be determined on a flow-weighted basis across all outfalls within a jurisdiction, not outfall-by-outfall.

~~Interim effluent limitations expressed as allowable exceedance frequencies are given in the compliance schedule under Specific Provision 6.c.~~

Table 6.2b
Effluent Limitations as Allowable Loading Rates for MS4 Discharges to the Water Body

Watershed	Load-based Effluent Limitations Expressed as Required % Load Reduction by MS4s					
	Dry Weather			Wet Weather		
	Total Coliform	Fecal Coliform	*Entero-coccus*	Total Coliform	Fecal Coliform	*Entero-coccus*
San Joaquin Hills/ Laguna Hills HSAs (901.11 and 901.12)	91.78%	91.72%	98.28%	46.85%	52.07%	51.26
Aliso HSA (901.13)	95.47%	95.58%	99.13%	25.29%	26.62%	27.52%
Dana Point HSA (901.14)	95.04%	95.03%	98.98%	13.15%	14.86%	15.16%
Lower San Juan HSA (901.27)	72.96%	74.21%	94.94%	19.21%	12.82%	27.12%
San Clemente HA (901.30)	94.28%	94.23%	98.83%	23.85%	24.58%	25.26%
San Luis Rey HU (903.00)	38.13%	39.09%	87.38%	5.62%	3.12%	11.69%
San Marcos HA (904.50)	82.82%	82.55%	96.03%	18.47%	18.98%	20.19%
San Dieguito HU (905.00)	14.39%	20.72%	83.48%	4.29%	1.46%	7.72%
Miramar Reservoir HA (906.10)	96.50%	96.59%	99.42%	1.61%	1.99%	1.93%
Scripps HA (906.30)	96.44%	96.42%	99.25%	16.32%	21.14%	18.82%
Tecolote HA (906.5)	94.51%	94.59%	98.94%	16.51%	20.47%	18.15%
Mission San Diego/ Santee HSAs (907.11 and 907.12)	74.03%	69.44%	93.96%	38.14%	53.22%	42.74%
Chollas HSA (908.22)	92.06%	92.15%	98.46%	17.82%	24.84%	21.26%

(3) Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 6.0 must incorporate the Comprehensive Load Reduction Plans (CLRPs) required to be developed pursuant to Resolution No. R9-2010-0001. For segments or areas in Table 6.0 that have been delisted from the Clean Water Act Section 303(d) List of Water Quality Limited Segments, a CLRP is not required.

(b) The Responsible Copermittee must implement BMPs to support the achievement of the final receiving water limitations or final WQBELs under Specific Provision 6.b for the segments or areas of the water bodies listed in Table 6.0.

(c) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with Caltrans and owners/operators of small MS4s as possible.

(d) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the final receiving water limitations or final WQBELs under Specific Provision 6.b;

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

~~c. Compliance Schedule~~

(1) ~~WLA~~ Compliance Dates

The Responsible Copermittees for MS4 discharges to a segment or area of the water bodies listed in Table 6.0 are required to achieve the WLA, thus must be in compliance with the WQBELs under Specific Provision 6.b, according to the following compliance schedule:

Table 6.3

Compliance Schedule Dates to Achieve Indicator Bacteria WLAs

Constituent	Dry Weather WLA Compliance Date	Wet Weather WLA Compliance Date
Total Coliform*	April 4, 2021	April 4, 2031
Fecal Coliform		
Enterococcus		

* Total coliform receiving water limitations only apply to segments or areas of Pacific Ocean Shoreline listed in Table 6.0.

(5) Final Compliance Determination

Compliance with final compliance requirements of Specific Provision 6.b may be demonstrated by a Responsible Copermittee via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water;

(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 6.b.(1) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls;

(c) There are no exceedances of the applicable effluent limitations under Specific Provision 6.b.(2) at the Responsible Copermittee's MS4 outfalls; OR

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 6.b.(1)(a) in the receiving water are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 6.b.(3).d.

~~d.~~c. INTERIM COMPLIANCE REQUIREMENTS

Interim TMDL compliance requirements for segments or areas of the water bodies listed in Table 6.0 consist of the following:
~~The Responsible Copermittees must comply with the following interim WQBELs by the interim compliance dates:~~

(1) Interim Dry Weather Receiving Water Limitations

The Responsible Copermittee must calculate the “existing” exceedance frequencies of the 30-day geometric mean water quality objectives for each of the indicator bacteria by analyzing the available monitoring data collected between January 1, 1996 and December 31, 2002. "Existing" exceedance frequencies may be calculated by segment or area of a water body, or by water body, and/or by Watershed Management Area listed in Table 6.0. Separate "existing" exceedance frequencies must be calculated for beaches and creeks/creek mouths.

The Responsible Copermittees must achieve a 50 percent reduction in the "existing" exceedance frequency of the 30-day geometric mean WQBELs for the segments or areas of the water bodies listed in Table 6.0 by the interim compliance dates for achieving the interim dry weather WQBELs given in Table 6.5. A 50 percent reduction in the "existing" exceedance frequency is equivalent to half of the "existing" exceedance frequency of the 30-day geometric mean WQBELs.

The "existing" exceedance frequencies and the interim dry weather allowable exceedance frequencies (i.e. interim dry weather WQBELs) calculated by the Responsible Copermittees must be included in the Water Quality Improvement Plans for the applicable Watershed Management Areas.

(2) Interim Wet Weather Receiving Water Limitations

The Responsible Copermittees must achieve the interim wet weather receiving water limitations in Table 6.4, expressed as interim allowable exceedance frequencies, by the interim compliance dates for achieving the interim wet weather WQBELs given in Table 6.5.

Table 6.4

(3) Interim Water Quality Based Effluent Limitations

In the case that interim receiving water limitations are exceeded after the end of the interim compliance schedules under Specific Provision 6.c.5, interim effluent limitations, expressed as required MS4 load reductions, will be used to determine whether MS4 discharges are causing or contributing to exceedances of interim receiving water quality limitations. To demonstrate MS4 the discharges are not causing or contributing to a exceedance of receiving water quality limitations, MS4 discharges must meet the required MS4 load reductions in Table 6.5.

Table 6.5

(4) Interim Best Management Practices

(a) The Water Quality Improvement Plans for the applicable Watershed Management Areas in Table 6.0 must incorporate the Comprehensive Load Reduction Plans (CLRPs) required to be developed pursuant to Resolution No. R9-2010-0001. For segments or areas in Table 6.0 that have been delisted from the Clean Water Act Section 303(d) List of Water Quality Limited Segments, a CLRP is not required.

(b) The Responsible Copermittee must implement BMPs to support the achievement interim receiving water limitations under Specific Provision 6.c.(1) and 6.c.(2) for the segments or areas of the water bodies listed in Table 6.0.

(c) The Responsible Copermittees should coordinate any BMPs implemented to address this TMDL with Caltrans and owners/operators of small MS4s as possible.

(d) For Copermittees utilizing the Water Quality Improvement Plan compliance option, the strategies and activities contained in the Water Quality Improvement Plan accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a:

(1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board;

(2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the interim receiving water limitations under Specific Provision 6.c.(1) and 6.c.(2) or interim load reduction requirements under Specific Provision 6.c.(3);

(3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND

(4) The Water Quality Improvement Plan is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.

~~(3)~~(5)Interim Compliance Dates

The Responsible Copermittees must achieve the interim receiving water limitations under Specific Provisions 6.c.(2)(1) and 6.c.(~~2~~3)~~(b)~~ or the interim WQBELs under Specific Provisions 6.c.(3) by the interim compliance dates given in Table 6.~~5~~6 unless alternative interim compliance dates are provided in a Comprehensive Load Reduction Plan or Water Quality Improvement Plan accepted by the San Diego Regional Board Executive Officer.

Table 6.5

(6) Interim Compliance Determination

Compliance with interim compliance requirements of Specific Provision 6.c may be demonstrated via one of the following methods:

(a) There is no direct or indirect discharge from the Responsible Copermittee's MS4s to the receiving water;

(b) There are no exceedances of the applicable interim receiving water limitations under Specific Provision 6.c.(1) and 6.c.(2) in the receiving water at, or downstream of the Responsible Copermittee's MS4 outfalls;

(c) The Responsible Copermittee demonstrates applicable interim WQBELs under Specific Provision 6.c.(3) have been achieved;

(d) The Responsible Copermittee can demonstrate that exceedances of the applicable interim receiving water limitations under Specific Provision 6.c.(1) and 6.c.(2) in the receiving water are due to loads from natural sources or non-MS4 sources; OR

(e) The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan, that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision 6.c.(4).d.

~~e.~~d. SPECIFIC MONITORING AND ASSESSMENT REQUIREMENTS

(1) Monitoring and Assessment Requirements for Beaches

(a) Monitoring Stations

For beaches addressed by the TMDL, monitoring locations should consist of, at a minimum, the same locations used to collect data required pursuant to Order Nos. R9-2007-0001 and R9-2009-0002, and beach monitoring for Health and Safety Code section 115880.[37] If exceedances of the applicable interim or final receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations must also be used to demonstrate that the bacteria loads from the identified anthropogenic sources have been addressed and are no longer causing exceedances in the receiving waters.

(b) Monitoring Procedures

(i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations at least monthly. Dry weather samples collected from additional monitoring stations established to identify sources must be collected at an appropriate frequency to demonstrate bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters.

(ii) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations at least once

[37] Commonly referred to as AB 411 monitoring

within the first 24 hours of the first storm event[38] of the rainy season (i.e. October 1 through April 30). Wet weather samples collected from receiving water stations and any additional monitoring stations established to identify sources must be collected at an appropriate frequency to demonstrate bacteria loads from the identified sources have been addressed and are no longer in exceedance of the allowable exceedance frequencies in the receiving waters.

(iii) Samples must be analyzed for total coliform, fecal coliform, and *Enterococcus* indicator bacteria.

(c) Assessment and Reporting Requirements

(i) The Responsible Copermittees must analyze the dry weather and wet weather monitoring data to assess whether the interim and final WQBELs for the Pacific Ocean Shoreline segments or areas listed in Table 6.0 have been achieved.

(ii) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

(2) Monitoring and Assessment Requirements for Creeks and Creek Mouths

(a) Monitoring Stations

For creeks addressed by the TMDL, monitoring locations should consist of, at a minimum, a location at or near the mouth of the creek (e.g. Mass Loading Station or Mass Emission Station) and one or more locations upstream of the mouth (e.g. Watershed Assessment Station). If exceedances of the applicable interim or final receiving water limitations are observed in the monitoring data, additional monitoring locations and/or other source identification methods must be implemented to identify the sources causing the exceedances. The additional monitoring locations must also be used to demonstrate that the bacteria loads from the identified sources have been addressed and are no longer causing exceedances in the receiving waters.

(b) Monitoring Procedures

[38] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)].

(i) The Responsible Copermittees must collect dry weather monitoring samples from the receiving water monitoring stations in accordance with the requirements of Provision D.

(ii) The Responsible Copermittees must collect wet weather monitoring samples from the receiving water monitoring stations within the first 24 hours of the first storm event[39] of the rainy season (i.e. October 1 through April 30).

(iii) Samples collected from receiving water monitoring stations must be analyzed for fecal coliform and *Enterococcus* indicator bacteria.

(c) Assessment and Reporting Requirements

(i) The Responsible Copermittees must analyze the receiving water monitoring data to assess whether the interim and final receiving water WQBELs for the creeks and creek mouths listed in Table 6.0 have been achieved.

(ii) The Responsible Copermittee must identify and incorporate additional MS4 outfall and receiving water monitoring stations and/or adjust monitoring frequencies to identify sources causing exceedances of the receiving water WQBELs.

(iii) The monitoring and assessment results must be submitted as part of the Annual Reports required under Provision F.3.b of this Order.

~~**f. COMPLIANCE DETERMINATION**~~

~~(1) Compliance with interim compliance requirements of Specific Provision 6.c.(2) may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 6.b.(1) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls;~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 6.b.(2) at the Responsible Copermittees' MS4 outfalls;~~

[39] Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)]. If only one sample is collected for a storm event, the bacteria density for every wet weather day associated with that storm event shall be equal to the results from that one sample. If more than one sample is collected for a storm event, but not on a daily basis, the bacteria density for all the wet weather days not sampled shall be equal to the highest bacteria density result reported from samples collected. The exceedance frequency shall be calculated by dividing the number of wet weather days that exceed the single sample maximum REC-1 WQOs by the total number of wet weather days during the rainy season.

~~(d) There are no exceedances of the applicable interim receiving water limitations under Specific Provision 6.c.(2) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls;~~

~~(e) The Responsible Copermittees can demonstrate that exceedances of the applicable interim or final receiving water limitations under Specific Provision 6.b.(1)(a) or 6.c.(2) in the receiving water are due to loads from natural sources, AND pollutant loads from the Copermittees' MS4 are not causing or contributing to the exceedances; OR~~

~~(f) The Responsible Copermittees have submitted and are fully implementing a Water Quality Improvement Plan, accepted by the San Diego Water Board, which provides reasonable assurance that the interim compliance requirements will be achieved by the interim compliance dates.~~

~~(2) Compliance with WQBELs of Specific Provision 6.b may be demonstrated via one of the following methods:~~

~~(a) There is no direct or indirect discharge from the Responsible Copermittees' MS4s to the receiving water;~~

~~(b) There are no exceedances of the applicable receiving water limitations under Specific Provision 6.b.(1) in the receiving water at, or downstream of the Responsible Copermittees' MS4 outfalls;~~

~~(c) There are no violations of the applicable effluent limitations under Specific Provision 6.b.(2) at the Responsible Copermittees' MS4 outfalls; OR~~

~~(d) The Responsible Copermittees can demonstrate that exceedances of the applicable final receiving water limitations under Specific Provision 6.b.(1)(a) in the receiving water are due to loads from natural sources, AND pollutant loads from the Copermittees' MS4 are not causing or contributing to the exceedances.~~

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
General Comment	Multiple	Multiple	The term "prohibit" is broader than Clean Water Act requirements, and should be changed to "effectively prohibit." CWA Provision 402(p) (3) (B) (ii) reads as follows: (B) Municipal Discharge – Permits for discharges from municipal storm sewers – (ii) shall include a requirement to <u>effectively prohibit</u> non-stormwater discharges into the storm sewer; (<u>Emphasis</u> added) The provision does not provide any reference to exemptions. Rather the Provision may be read that a permit shall "effectively prohibit non-stormwater discharges" but may exempt certain discharges that are not significant sources of pollutants from the prohibition. The Provision does not require a <u>full</u> prohibition but rather an <u>effective</u> prohibition. The operative word is "effective". The more precise and correct finding/provision should note that non-stormwater discharges are effectively prohibited (per 402 (p) (3) (B) (ii)). However discharges that are not significant sources of pollutants are exempted from the prohibition. In a practical sense the use of word "effective" provides flexibility to assess the impacts of relatively benign discharges such as landscape irrigation, air condition condensate, individual car washing, and non-emergency fire fighting flows or non-anthropogenic sources before instituting a prohibition.	Revise "prohibit" to "effectively prohibit" throughout the Permit when referring to non-storm water discharges.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
I. FINDINGS				
3 and throughout, as applicable	1	CWA NPDES Permit Conditions		Remove the following term in Finding 3 and throughout, as provided in the Strikeout: "~~storm water~~"
8	3	Point Source Discharges of Pollutants	Discharges may contain waste or pollutants, but it should not be presumed that they necessarily always contain waste or pollutants. In addition, it is inappropriate to consider all storm water and non-storm water discharges point source discharges.	Revise the text as follows: "Discharges from the MS4s <u>may</u> contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s <u>may</u> contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the ~~Water Quality Control Plan for the San Diego Basin~~ ~~(~~Basin Plan~~)~~. ~~Storm water and non-storm water discharges from the MS4s are subject to the conditions and requirements established in the Basin Plan for point source discharges.~~ "
11	4	Runoff Discharges to Receiving Waters	Finding 11 is inconsistent with the definition of the MS4 in 40 C.F.R. 122.26, which does not include natural rivers and streams: "(8) *Municipal separate storm sewer* means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains): (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management	Revise the text as follows: "11. Runoff Discharges to Receiving Waters. The MS4s discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within the eleven hydrologic units comprising the San Diego Region. Historic and current development makes use of natural drainage patterns and features as conveyances for runoff. ~~Rivers, streams and creeks in developed areas used in this manner are part of the Copermittees' MS4s regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the rivers, streams and creeks in the developed areas of the Copermittees' jurisdictions are both an MS4 and receiving water.~~ Numerous receiving water bodies and water body segments have been designated as impaired by the San

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

			agency under Provision 208 of the CWA that discharges to waters of the United States; (ii) Designed or used for collecting or conveying storm water; (iii) Which is not a combined sewer; and (iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.	Diego Water Board pursuant to CWA Provision 303(d)."
15	5	Non-Storm Water and Storm Water Discharges	This is a legal argument that is contrary to the plain language of the statute, which specifically states that 'Permits for discharges from municipal storm sewers… shall require controls to reduce the discharge of pollutants to the maximum extent practicable…"402(p)(3)(B)(iii). The maximum extent practicable standard applies to storm water and non-storm water discharges.	Revise the text as follows: "~~Non-storm water discharges from the MS4s are not considered storm water discharges and therefore are not subject to the MEP standard of CWA section 402(p)(3)(B)(iii), which is explicitly for Municipal… *Stormwater Discharges* (emphasis added)" from the MS4s.~~ Pursuant to CWA 402(p)(3)(B)(ii), non-storm water discharges into the MS4s must be effectively prohibited. <u>"Permits for discharges from municipal storm sewers shall require controls to reduce the discharge of pollutants to the maximum extent practicable…" 402(p)(3)(B)(iii)."</u>
27	8	Integrated Report and Clean Water Act Section 303(d) List.		Revise the last paragraph as follows: "Implementation of the requirements of this Order <u>will</u> ~~may~~ allow the San Diego Water Board to include surface waters impaired by discharges from the Copermittees' MS4s in Category 4 in the Integrated Report for consideration during the next 303(d) List submittal by the State to USEPA."
29	9	Unfunded Mandates	Finding 29 states that the Order does not constitute an unfunded mandate under Article XIIIB, Section 6 of the California Constitution. This finding has no legal effect because the Regional Board does not have jurisdiction to determine what is a state mandate, and therefore should be deleted. The Commission on State Mandates, the agency with exclusive jurisdiction over state mandate claims, determined that multiple requirements in the 2007 San Diego MS4 Permit were unfunded state mandates. This case is currently on appeal before the Third Appellate	Delete Finding 29.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			District (Case No. C070357). Like the 2007 Permit, the Tentative Order exceeds the requirements of federal law, and the Copermittees reserve their right to challenge permit provisions exceeding federal law in the appropriate forum.	
II. PROVISIONS				
A. Prohibitions and Limitations				
A	13	Prohibitions and Limitations	The proposed Prohibitions and Limitation provisions may be construed as stand-alone provisions that could expose the Copermittees to state and federal enforcement actions, as well as to third party actions under the federal Clean Water Act's citizen suit provisions. Consistent with the recent 9th Circuit Court of Appeal decision (NRDC v. LA County), each provision of the permit could be read separately so if provision A.2.a states that "the MS4 must not cause or contribute to a violations of a water quality standard" then that is the stand-alone provision, and the accompanying language found in A.4 (Compliance with Discharge Prohibitions) regarding compliance may be considered irrelevant. As such, a clear linkage between the compliance provisions and the prohibitions, receiving water limitations, and effluent limitations must be established.	Insert the following sentence at the end of the introductory paragraph of Provision A: "<u>The process for determination of compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3) is defined in Provision A.4.</u>"
A.1.a (and throughout, as applicable)	13	Discharge Prohibitions	Provision A.1.a prohibits certain discharges into waters of the state. NPDES permits under the authority of the Clean Water Act regulate discharges into navigable (surface) waters. Expanding the scope of the Discharge Prohibitions to waters of the state would expand the scope of the Permit to protect groundwater. This exceeds federal requirements and would represent an unfunded mandate. Other MS4 permits in California, including the Los Angeles County MS4 permit, protect "waters of the United States."	Throughout the Permit, change "waters of the state" to "waters of the United States", where applicable (and throughout the Tentative Order). Revise the text as follows: "…in receiving waters of the <u>US</u> ~~state~~ are <u>effectively</u> prohibited…"

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
A.1.a A.1.c A.2.a	13 13 13	Prohibitions and Limitations	The Discharge Prohibitions do not establish a sufficient linkage with approved compliance schedules for TMDLs that have been incorporated into the Basin Plan. TMDLs adopted within the region include a schedule to provide MS4 Copermittees the time necessary to develop and implement a plan to achieve water quality standards in impaired waters. The compliance schedules for effective TMDLs have been incorporated into Attachment E, but these schedules are not included in Provision A.1 or A.2. By not referencing TMDL schedules, these provisions could result in violations of the permit even though the implementation compliance dates have not yet passed. Without modification, the Discharge Prohibitions *conflict* with TMDL compliance schedules. Language should be included to clarify that in instances where a TMDL is in place, or a TMDL is being developed, the Copermittees shall achieve compliance with these provisions as outlined in Attachment E (Specific Provisions for Total Maximum Daily Loads).	Revise A.1.a, A.1.c, and A.2.a by adding the following onto the end of each provision: "…, <u>unless such discharges are addressed by the Copermittee(s) through Provision A.1.d, A.3.b or A.4.</u>"
A.3.a, footnote 5	15	Technology Based Effluent Limitations	See comment for Finding 15.	Revise text as follows: "This does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in ~~storm water~~ discharges to the MEP…"
A.4	15	Compliance with Discharge Prohibition and Receiving Water Limitations	The Copermittees envision Water Quality Improvement Plans as the foundation for a compliance approach for the Discharge Prohibitions, RWLs, and Effluent Limitations. However, the language in Provision A does not clearly link compliance with the iterative process set forth in the Water Quality Improvement Plans. The Water Quality Improvement Plans should provide an optional mechanism to "raise the bar" with regards to the detail and quantitative analyses used to identify pollutant sources, implement BMPs to address those sources, and increase the number or size of BMPs until water quality standards are attained. However, as Provision A.4 is written, the envisioned	Revise the text as follows: "Each Copermittee must achieve compliance with Provisions A.1.a, A.1.c and A.2.a of this Order through timely implementation of <u>strategies,</u> control measures and other actions as specified in Provisions B and E of this Order, including any modifications. The Water Quality Improvement Plans required under Provision B must be designed and adapted to ultimately achieve compliance with Provisions A.1.a, A.1.c, and A.2.a, <u>and may be used for compliance determination as described in Provision B.3.a.(3).</u>

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			strategic compliance process falls short, and the Water Quality Improvement Plans do not have a meaningful linkage to Permit compliance. An unintended but significant consequence of this compliance uncertainty is that Copermittees will be faced with increased difficulty securing program funding because even substantial increases in funding would not eliminate the potential for non-compliance. The proposed approach for incorporating Water Quality Improvement Plan-based compliance option into the Permit is described in comments on Provision B.3.a.(3).	
A.4.a.(2)	15	Compliance with Discharge Prohibitions and Receiving Water Limitations	The Water Quality Improvement Plan should be responsive to new pollutants of concern if they are persistently exceeding standards and not be tied to a reactionary commitment based on a one time exceedance of a water quality objective.	Revise first sentence of Provision A.4.a.(2) as follows: "Upon a determination by either the Copermittees or the San Diego Water Board that discharges from the MS4 are causing or contributing to ~~a new~~ persistent indications of an exceedance…"
A.4.a.(2)	15	Compliance with Discharge Prohibitions and Receiving Water Limitations	See comment A.4.	Add new Provision A.4.a.(2)(c) as follows: "(c)For Copermittees who are implementing an Water Quality Improvement Plan pursuant to Provision B.2, the updated Water Quality Improvement Plan should provide reasonable assurance the updated strategies are expected to address the new exceedance(s)."
A.4.c	16	Compliance with Discharge Prohibitions and Receiving Water Limitations		Remove Provision A.4.c.
B. Water Quality Improvement Plans				
B	17	Water Quality Improvement Plans	The Copermittees request a revision to the Water Quality Improvement Plan goal statement. A concise goal statement that is more central to MS4 permitting is requested. This goal statement provides context to several	Revise the goal statement in the second sentence as follows: The goal of the Water Quality Improvement Plans is to

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			requested revisions to subsequent provisions.	~~protect, preserve, enhance,~~ 1) effectively prohibit non-storm water discharges into the MS4s, 2) reduce pollutants in discharges from the MS4s to the MEP, and ~~restore the~~ 3) support the attainment and reasonable protection, preservation, and enhancement of water quality and designated beneficial uses of waters of the state. This goal will be accomplished through an adaptive planning and management process that identifies the highest priority water quality conditions within a watershed and implements strategies through the jurisdictional runoff management programs to achieve improvements in the quality of discharges from the MS4s and receiving waters.
B	17	Water Quality Improvement Plans	The Copermittees request the Regional Board use Water Quality Improvement Plans to fully integrate watershed planning, BMP implementation, and Permit compliance determination and have proposed an approach for Water Quality Improvement Plans to form the basis for compliance as described in the comment below regarding the addition of a new subsection to B.3. Additional language is requested in the opening paragraph to Provision B to provide a linkage to the proposed revision to Provision B.3.	Add the following sentence at the end of the first paragraph in Provision B: Therefore, implementation of the Water Quality Improvement Plans also provides the basis for complying with Provisions A.1, A.2 and A.3, as described in Provision B.3.a.(3).
B.1	17	Watershed Management Areas	Allow Riverside County Copermittees to enroll and for a full watershed scale public process in the development of the Water Quality Improvement Plan for the Santa Margarita River Watershed.	Add an additional paragraph to B.1 that reads: "Development of the Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area shall commence upon notification of coverage of the Riverside County Copermittees under this Order. Until this time, the County of San Diego shall use the water quality priorities in the Santa Margarita River Watershed Urban Runoff Management Plan, developed pursuant to Order No. R9-2007-0001, to guide implementation of Provisions D and E within its jurisdiction."
B.2.d.(1)(e) and B.2.d.(3)	21-22	Identification of MS4 Sources of	The Copermittees do not have jurisdiction to control MS4 discharges outside of their respective MS4s.	Delete Provisions B.2.d.(1)(e) and B.2.d(3).

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Pollutants and/or Stressors		
B.2.e	23	Numeric Goals and Schedules	The requirement that "Final dates for achieving final numeric goals must not initially extend more than 10 years..." may be broadly misinterpreted as currently written with major implications. Based on conversations with Regional Board staff, it is understood that goals can take a number of forms and the "10 year" requirement is not intended as a requirement to attain all Basin Plan water quality standards within 10 years. However, to ensure this requirement is not misinterpreted by third parties, language should be added to make this clarification.	Add a footnote Provision B.2.e., as follows: "Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years." Revise text as follows: "… Numeric goals must be used to support Water Quality Improvement Plan implementation and measure progress towards addressing the highest priority water quality conditions identified under Provision B.2.c. Numeric goals are not enforceable compliance standards, effluent limitations, or receiving water limitations."…
B.3	24	Water Quality Improvement Strategies		Revise the text as follows: "…by ~~preventing or eliminating~~ effectively prohibiting non-storm water discharges to ~~and from~~ the MS4, reducing pollutants in ~~storm water~~ discharges from the MS4 to the MEP…"
B.3.a.	24	Water Quality Improvement Strategies and Schedules	The Copermittees request the Regional Board use Water Quality Improvement Plans to fully integrate watershed planning, BMP implementation, and Permit compliance determination. The Copermittees propose an optional compliance mechanism that Copermittees could chose to follow. To follow this optional path the Water Quality Improvement Plans would be required to demonstrate via a scientific analyses that the number and type of strategies and	To incorporate an option for Water Quality Improvement Plan-based compliance, add a new Provision "B.3.a.(3)" as follows: (3) Copermittees may elect to develop their Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism for the discharge prohibitions (A.1), receiving water limitations (A.2), and effluent limitations (A.3). To utilize the Water

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			activities to be implemented will attain discharge prohibitions, receiving water limitations, and effluent limitations. The analyses would be detailed in an optional *Reasonable Assurance Analysis*. The types of analyses that would be included a Reasonable Assurance Analysis – including efforts to quantify stormwater pollutant fate and transport and strategy/activity effectiveness – are beyond conventional stormwater planning efforts, and thus the Reasonable Assurance Analysis should be optional and not required. In order to qualify for the Water Quality Improvement Plan-based compliance mechanism, a Water Quality Improvement Plan would be [1] developed using rigorous, quantitative analyses to provide reasonable assurance that BMPs are expected to attain water quality standards and [2] sufficiently detailed in terms of the strategies and activities that will be implemented so that an quantitative analysis can be conducted. The proposed approach would allow the Regional Board to measure compliance in a clear, specific, measurable, and enforceable manner. In order to a Copermittee to qualify for the optional, Water Quality Improvement Plan-based compliance mechanism, the Copermittee would be required to [1] notify the Regional Board of its intent to pursue the optional compliance mechanism, [2] submit a *Reasonable Assurance Analysis*, , and [3] provide a sufficiently detailed implementation schedule.	Quality Improvement Plan-based compliance option, Copermittees shall conduct a Reasonable Assurance Analysis. The objective of the Reasonable Assurance Analysis shall be to demonstrate the strategies and activities of the Water Quality Improvement Plan will ultimately result in attainment of the discharge prohibitions (A.1), receiving water limitations (A.2), and effluent limitations (A.3). In order for a Copermittee to utilize the Water Quality Improvement Plan-based compliance option, the Regional Board Executive Officer must determine the following conditions are met: (1) The Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water Board as described in Provision F.1.(a); AND (2) The submitted Water Quality Improvement Plan includes a Reasonable Assurance Analysis that demonstrates that the strategies and activities in the Water Quality Improvement Plan will attain the applicable discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3); AND (3) The submitted Water Quality Improvement Plan includes a schedule as outlined in Provision B.3.b that provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				manner. If a Water Quality Improvement Plan-based compliance option is approved by the Regional Board Executive Officer, then in instances when the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) are not met, the implementation of the strategies and activities contained in the Water Quality Improvement Plan will be used for determination of compliance with Provision A. That is, any determination of a Copermittee's compliance with Provision A shall be based on the following conditions: (1) The strategies and activities of the Water Quality Improvement Plan are implemented per the approved schedule outlined pursuant to Provision B.3.b and adapted pursuant to Provisions B.5, F.1, and F.2; AND (2) If exceedances persist notwithstanding implementations of the strategies and activities in the approved Water Quality Improvement Plan, then Responsible Copermittees revise the Water Quality Improvement Plan pursuant to Provision A.4.a, and implement the revised Water Quality Improvement Plan including additional or alternative activities per the schedule submitted with the revised Water Quality Improvement Plan. For cases when applicable discharge prohibitions (A.1), receiving water limitations (A.2), or effluent limitations (A.3) are not attained during the time period between a Copermittee's notification of intent to utilize a Water Quality Improvement Plan-based compliance option, pursuant to Provision F.1.(a), and Regional Board Executive Officer approval of the submitted Water Quality

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				Improvement Plan, determination of a Copermittee's compliance with Provision A shall be based on the following conditions: (1) All deadlines for development of a Water Quality Improvement Plan pursuant to Provision F.1.(a) and (b) are met; AND (2) The Water Quality Improvement Plan ultimately receives final approval.
B.5.a	25	Re-Evaluation of Priority Water Quality Conditions	The proposed revisions to Provision B.5 are intended to add a link with jurisdictional implementation efforts and to clarify receiving water conditions.	Revise first paragraph of B.5.a. as follows: "The priority receiving water quality conditions, and numeric goals and corresponding schedules, included…"
B.5.b.(2)	27	Adaptation of Strategies and Schedules		Revise the text as follows: "…reductions of non-storm water discharges to ~~and from~~ each Copermittee's MS4…"
B.5.b.(3)	27	Adaptation of Strategies and Schedules	See comment for Finding 15.	Revise the text as follows: "…reductions of pollutants in ~~storm water~~ discharges from each Copermittee's MS4…"
C. Action Levels				
C.1, footnote 7	28	Non-Storm Water Action Levels	Clarify that NALs are not enforceable compliance points.	Revise text as follows: "NALs are not considered ~~by the San Diego Water Board~~ to be enforceable limitations.
C.1.a C.1.b C.2.a C.2.b	28 30 31 32	Action Levels	The Draft Order in Provision B states that the goal of the Water Quality Improvement Plan is to identify the highest water quality priorities within a watershed and implement strategies to achieve improvements in the quality of discharge and receiving waters. Furthermore in Provision B.2.d the Copermittees are required to develop and use *interim and final numeric targets/goals* to measure progress towards the protection/enhancement of the receiving waters and beneficial uses. The choice of the target/goals of the watershed may be biological, chemical, or physical based	Revise the following Provisions, as indicated: C.1.a:"The following NALs must be incorporated, if the Copermittees do not establish numeric action levels within the Water Quality Improvement Plan based on watershed priorities: " C.1.b: "~~If not identified in Provision C.1.a~~, NALs must be identified, developed, and incorporated in the Water

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			and may include multiple criteria and/or indicators. The permit now provides a clear linkage between Provision B and Provision C and states that the Water Quality Improvement Plan should guide the customization of the NALs/SALs to meet the highest water quality priorities in a given watershed and that NALs/SALs will be used to assist Copermittees in reaching the goals specified in the Water Quality Improvement Plan. Although action levels will be used for several different purposes, the action levels defined in Provision C.1.a and C. 2.a are chemically based and may be in conflict with the selected watershed metrics. As an example, if the watershed metric is improved IBI scores for a water body, then NALs and SALs associated with water chemistry are unlikely to be the best metric to evaluate progress towards improving IBI scores or for assessing our implementation efforts. Thus, the chemically based NALs/SALs may direct resources away from the watershed priorities. Since Provision C indicates that there are three different purposes for the action levels, the permit should recognize that the action levels for each permit provision (B.4, D.4.a, and/or E.2) may be based on different constituents, metrics, and/or may be different values. A revision of the language in C.1.a and C.2.a stating that Tables C-1 to C-5 are only applicable if the Copermittees do not establish numeric action levels to support the Water Quality Improvement Plan would allow for the determination of appropriate numeric NALs and SALs per the intent of each permit provision.	Quality Improvement Plans…." C.2.a: "The following SALs for discharges of storm water from the MS4 must be incorporated, <u>if the Copermittees do not establish numeric action levels within the Water Quality Improvement Plan based on watershed priorities: </u> " C.2.b: "~~If not identified in Provision C.1.a~~, SALs must be identified, developed, and incorporated in the Water Quality Improvement Plans…."
C.1.a.(2) Table C-3	29	Non-Storm Water Action Levels	Refer to the California Toxics Rule (CTR) instead of including equations in the notes of Table C-3. The note to the table incorrectly sets the chronic CTR standard (Criterion Continuous Concentration; CCC) as both the	Revise the Table C-3 Notes as follows: * Action levels developed on a case-by-case basis (see below)

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			monthly average (AMAL) and daily maximum (MDAL) NALs. However, the acute CTR standard (Criterion Maximum Concentration; CMC) should be used instead of the chronic standard for the daily maximum. Another important reason to include the equations by reference is that the equations in the notes of Table C-3 also do not take into account that in some cases a site-specific water effects ratio may apply, which is considered in and allowed by the California Toxics Rule.	** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Provision 64431 The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to ~~the following~~ 40 CFR 131.38.b.2 for details.~~) will be required:~~ ~~Cadmium (Total Recoverable) = exp(0.7852[ln(hardness)] - 2.715)~~ ~~Chromium III (Total Recoverable) = exp(0.8190[ln(hardness)] + 0.6848)~~ ~~Copper (Total Recoverable) = exp(0.8545[ln(hardness)] - 1.702)~~ ~~Lead (Total Recoverable) = exp(1.273[ln(hardness)] - 4.705)~~ ~~Nickel (Total Recoverable) = exp(.8460[ln(hardness)] + 0.0584)~~ ~~Silver (Total Recoverable) = exp(1.72[ln(hardness)] - 6.52)~~ ~~Zinc (Total Recoverable) = exp(0.8473[ln(hardness)] + 0.884)~~
C.2, footnote 9	31	Storm Water Action Levels	Clarify that SALs are not enforceable compliance points.	Revise text as follows: "SALs are not considered ~~by the San Diego Water Board~~ to be enforceable limitations.
D. Monitoring and Assessment Requirements				
D.1	33	Receiving Water	About one year of lead time is needed to plan and secure	The Copermittees must develop and conduct a program to

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Monitoring Requirements	the resources and contracting mechanisms to conduct monitoring programs. If the Order is adopted on March 1, 2013, then the Water Quality Improvement Plan would be submitted to the Regional Board by September 2014. The Water Quality Improvement Plan could be accepted by the Regional Board as early as 60 days after submittal (by November 2014) and as late as 6 months after submittal (by February 2015). Budgeting for the next fiscal year usually begins in October. Without an approved Water Quality Improvement Plan, it will be difficult to plan and secure the necessary funding. Therefore, to accommodate budgeting cycles, transitional monitoring should be required until the implementation monitoring schedule proposed in the Water Quality Improvement Plan is approved. Allowing this flexibility will allow time for the necessary resources to be secured by the WMA. Moreover, individual Water Quality Improvement Plans may likely be adopted at different times by the Regional Board and incorporating the implementation schedule of monitoring within the Water Quality Improvement Plan will increase the efficiency of the process.	monitor the condition of the receiving waters in each Watershed Management Area during dry weather and wet weather. Following acceptance of the Water Quality Improvement Plans <u>and schedule for implementation of monitoring</u> for each Watershed Management Area, the Copermittees must conduct long-term receiving water monitoring during implementation of the Water Quality Improvement Plan to assess the long term trends and determine if conditions in receiving waters are improving. This change is incorporated in *Proposed Changes* to Provision D below:
D.1.a	33	Transitional Receiving Water Monitoring	See comment D.1	Until the monitoring requirements <u>and implementation schedule for monitoring</u> of Provisions D.1.b-e are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following receiving water monitoring in the Watershed Management Area:
D.1.a.(1)	33	Transitional Receiving Water Monitoring	The Copermittees request removal of Coastal Storm Drain Monitoring Program from Transient Receiving Monitoring. The San Diego Copermittees' Report of Waste Discharge (2011) demonstrated a limited relationship (less than 2 %) between receiving water concentrations/exceedances and storm drain concentrations/exceedances in dry weather. <u>Duplicative Effort</u> - Many storm drain outfalls/receiving waters will be monitored as part of the Bacteria TMDL or the	Revise Provision D.1.a.(1) as follows: (1) Continue the receiving water monitoring programs required in Orders Nos. R9-2007-0001 <u>(Attachment A, Provision II. A. 1-5),</u> R9-2009-0002, and R9-2010-0016;

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				(ii) For Copermittees with 125 major MS4 outfalls or more, but less than or equal to 500, that discharge to receiving waters within a Watershed Management Area all the outfalls must be visually inspected at least annually during dry weather conditions. For Copermittees with jurisdiction in more than one WMA, this requirement is limited to 500 inspections annually per Provision D.2.a.(2)(a)(iv). (iii) For Copermittees with more than 500 major MS4 outfalls that discharge to receiving waters within a Watershed Management Area, at least 500 outfalls must be visually inspected at least annually during dry weather conditions. Copermittees with more than 500 major MS4 outfalls within a Watershed Management Area must identify and prioritize at least 500 outfalls to be inspected considering the following: [a] Assessment of connectivity of the discharge to a flowing receiving water; [b] Reported exceedances of NALs in water quality monitoring data; [c] Surrounding land uses; [d] Presence of constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA Provision 303(d) List; and [e] Flow rate. For Copermittees with jurisdiction in more than one WMA, this requirement is limited to 500 inspections annually, per Provision D.2.a.(2)(a)(iv).
D.2.a.(3)	45	Transitional Wet Weather MS4 Outfall Discharge Monitoring	See D.1	Revise Provision D.2.a.(3) as follows: "Until the monitoring requirements and the monitoring implementation schedule described in ~~of~~ Provision D.2.c are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1…"
D.2.a.(3)(a)	46	Transitional Wet	Reduce the number of transitional wet weather MS4 outfall	Add an additional paragraph to D.2.a.(3)(a) that reads:

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Weather MS4 Outfall Discharge Monitoring Stations	discharge monitoring stations for the Santa Margarita River Watershed Management Area to be proportional to the area of the watershed within the County of San Diego until such time the County of Riverside Copermittees are notified of coverage. After such time, the number of wet weather MS4 outfall discharge monitoring stations will be increased to five (5) as defined in D.2.(3).(a).	"<u>The County of San Diego shall select at least two (2) transitional wet weather MS4 outfall discharge monitoring stations for the portion of the Santa Margarita River Watershed Management Area within its jurisdiction until the Riverside Copermittees are enrolled under this Order. After the Riverside Copermittees are enrolled, the Watershed Management Area Copermittees shall select at least five (5) transitional wet weather MS4 outfall discharge monitoring stations consistent with the requirements above.</u>"
D.2.a.(3)(b)	46	Transitional Wet Weather MS4 Outfall Discharge Monitoring Frequency	Reduce the frequency of sampling from annual to once during the 2-year transition period, because San Diego Copermittees have already satisfied the intent of this provision to provide baseline MS4 data. The 2007 Permit MS4 program will be completed in 2013 and characterizes baseline MS4 conditions through a statistically robust random sampling program (over 160 samples collected to date), in addition to targeted monitoring at selected sites. Collectively, the San Diego Copermittees also have performed storm event composite sampling for more than 150 wet weather MS4 discharge events to derive event mean concentrations and estimate the loading from single family residential, commercial and industrial land uses. The current First flush requirement skews the data set towards very early season conditions. Need samples representing a broader range of conditions to produce more representative data to better characterize seasonal/hydrological variation, and produce more accurate loading estimates. Logistically difficult to get equipment and personnel ready/available to monitor all sites in any one event. Propose minimum 10% of samples be First Flush, with at least one per WMA.	Revise Provision D.2.a.(3)(b) as follows: (b) Transitional Wet Weather MS4 Outfall Discharge Monitoring Frequency Each wet weather MS4 outfall discharge monitoring station selected pursuant to Provision D.2.a.(3)(a) must be monitored twice during the wet season (October 1 – April 30<u>) in the transitional period</u>. ~~One~~ <u>The</u> wet weather monitoring event<u>s shall be selected to be representative of the range of hydrological conditions experienced in the region. At least 10% of samples</u> must be conducted during the first wet weather event of the wet season<u>, to include at least one such sample in each Watershed Management Area</u>~~, and one wet weather monitoring event at least a month after the first wet weather event of the wet season.~~

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
D.2.b.(2)(b)(i)	49	Non-Storm Water Persistent Flow MS4 Outfall Discharge Monitoring Frequency	The tentative order currently requires monitoring twice annually of at least 10 MS4 outfalls per WMA in which a jurisdiction is present; this adds up to 322 outfalls at one time across the region. The current requirement, as written, would significantly restrict available resources to follow-up on the top priorities - particularly in mid-size jurisdictions. The analytical requirements twice a year for mid-size cities would cost significantly more than the current dry weather program. Jurisdictions vary in size, population and thus number of major MS4 outfalls. Our recommendation is for an equitable approach: Assume 5 (unless a jurisdiction has less than 5) instead of 10 per jurisdiction within each WMA in which a jurisdiction is present. The total then equals 172 outfalls regionally instead of 322 (we proposed 69 on Sept 14th).	Revise Provision D.2.b.(2)(b)(i) as follows: "Based on the prioritization of major MS4 outfalls developed under Provision D.2.b.(2)(a), each Copermittee must identify, at a minimum, the ~~10~~ 5 highest priority major MS4 outfalls with non-storm water persistent flows that the Copermittee will monitor within each Watershed Management Area within its jurisdiction. If a Copermittee has less than 5 major outfalls within a WMA, the Copermittee shall monitor all of its major outfalls with persistent flows within that WMA."
D.2.b.(2)(e)(iii)	51	Non-Storm Water Persistent Flow MS4 Outfall Discharge Analytical Monitoring	Allow increased flexibility to developers of the Water Quality Improvement Plans to determine the appropriate analytes necessary to track and eliminate the prioritized persistent flows for specific Watershed Management Areas. Increase efficiency by increasing flexibility of analytical requirements in D.2.b & Table D-8 (p. 51): • Allow flexibility in Water Quality Improvement Plan to focus analytical testing and • After initial identification of issue, allow analytical testing reduced to key pollutants that exceed WQOs and aid in source abatement	Revise Provision D.2.b.(2)(e)(iii) as follows: (iii) During development of the Water Quality Improvement Plan, for each WMA, consider the following sources to select constituents for ~~C~~ collection of grab or composite samples to be analyzed ~~for the following constituents~~ at a qualified analytical laboratory: [a] Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan, [b] Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA Provision 303(d) List, [c] Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order, [d] Applicable NAL constituents, and [e] Constituents listed in Table D-8~~, unless the~~ (iv) Copermittees may adjust the analytical list for a given WMA in successive monitoring events ~~has~~ to add or

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				eliminate constituents based on ~~historical~~ data that can demonstrate or provide justification ~~that~~ regarding the need or lack of need for analysis of ~~the~~ specific constituents ~~is not necessary~~. (~~i~~v) If the Copermittee identifies and eliminates the source of the persistent flow non-storm water discharge, analysis of the sample is not required.
D.2.c	52	Wet Weather MS4 Outfall Discharge Monitoring	Outfall monitoring is generally not an efficient or effective way of identifying sources of pollutants within urban watersheds. Source identification will be undertaken in the context of Special Studies (Provision D.3), as directed by the Water Quality Improvement Plan strategies to address specific issues in WMAs. The outfall monitoring data will be used to help design those strategies.	Revise Provision D.2.c. as follows: "c. Wet Weather MS4 Outfall Discharge Monitoring The Copermittees must perform wet weather MS4 outfall monitoring to identify ~~sources of~~ pollutants in storm water discharges from the MS4s in the Watershed Management Area, and provide information to help guide source identification efforts. The Copermittees must conduct the following wet weather MS4 outfall discharge monitoring within the Watershed Management Area: (1) Wet Weather MS4 Outfall Discharge Monitoring Stations The Copermittees may adjust the wet weather MS4 outfall discharge monitoring locations and frequencies in the Watershed Management Area, as needed, to identify ~~sources of~~ pollutants in storm water discharges from MS4s in the Watershed Management Area in accordance with the highest priority water quality conditions identified in the Water Quality Improvement Plan, provided the number of stations is at least equivalent to the number of stations required under Provision D.2.a.(3)(a). (2) Wet Weather MS4 Outfall Discharge Monitoring Frequency The Copermittees must monitor the wet weather MS4 outfall discharge monitoring stations in the Watershed Management Area at an appropriate frequency to identify ~~sources of~~ pollutants in storm water discharges from the MS4s causing or contributing to the highest priority water quality conditions identified in the Water Quality

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				Improvement Plan."
D.3.a D.3.d	54 55	Special Studies	Special studies are typically multi-year efforts, requiring planning, funding approval/allocation, implementation, and analysis. Allow for special studies to be counted that are *initiated* during the current permit term as well as under the new permit term. Otherwise, unexpected delays (e.g., due to fire storms, etc.) could result in permit noncompliance. Flexibility is needed to maintain scientific rigor of studies and to accommodate variation in hydrological conditions, etc… Several Special Studies are currently ongoing. Planning and schedule for implementation of new Special Studies will be included within each Water Quality Improvement Plan, subject to RWQCB approval. In addition, the Copermittees request the number of Special Studies be reduced from 3 to 2 per WMA and from 2 to 1 for Regional Studies in consideration of the planning period required to develop the Monitoring and Assessment Plan required as part of the Water Quality Improvement Plan.	Revise Provision D.3.a.as follows: "a. Within the term of this Order, the Copermittees must ~~develop and implement~~ initiate the following special studies: (1) At least two ~~three~~ special studies in each Watershed Management Area to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that cause or contribute to highest priority water quality conditions identified in the Water Quality Improvement Plan. (2) At least one ~~two~~ special study~~ies~~ for the San Diego Region to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that are impacting receiving waters on a regional basis in the San Diego Region. (3) One of the two ~~three~~ special studies in each Watershed Management Area may be replaced by a special study implemented pursuant to Provision D.3.a.(2)…" Revise Provision D.2.d. as follows: "d. Special studies initiated prior to the ~~acceptance of the Water Quality Improvement Plan~~ term of this Order that meet the requirements of Provision D.3.b and are ~~completed~~ implemented during the term of this Order may be utilized to fulfill the special study requirements of Provision D.3.a. "

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
D.4	56-63	Assessment Requirements	Assuming that the overall purpose is to assess progress in reducing concentrations and loads of pollutants in runoff, the issue is that *annual* assessments of progress in load reductions won't provide useful information and will divert resources from program implementation, the high variability of water quality data and relatively small annual changes in loading and quality (≤10%) can't be overcome with reasonable numbers of samples. A longer assessment term is needed for meaningful analysis.	See proposed changes below.
D.4.b.(1)(a)(ii)	57	Non-Storm Water Discharges Reduction Assessments	Need to ensure timing for reporting will be compatible with completion of assessment.	Revise Provision D.4.b.(1)(a)(ii) as follows: "(ii) Based on the data collected pursuant to Provisions D.2.b, the assessments required under Provision D.4.b.(1)(c) must be included when complete in the ~~first~~ Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter. "

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
D.4.b.(1)(c)(iv)	58	Non-Storm Water Discharges Reduction Assessments	Proposed Dry Weather method for calculation of jurisdictional loads: extrapolate from monitored major MS4 outfalls with persistent flows to remainder of major MS4 outfalls with persistent flows collectively for each jurisdiction in each WMA.	Revise Provision D.4.b.(1)(c)(iv) as follows: "(iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b, and utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during the monitoring year. These calculations or estimates must be updated annually. [a] Each Copermittee must calculate or estimate: ~~[a]~~ Annual non-storm water volumes and pollutant loads collectively discharged from the Copermittee's major MS4 outfalls to receiving waters within the Copermittee's jurisdiction~~, with an estimate of the percent contribution from each known and suspected source for each MS4 outfall~~; [b] Each Copermittee must ~~Annual non-storm water volumes and pollutant loads~~ identify and quantify, where feasible, sources of non-stormwater flows ~~from areas or facilities subject to~~ not subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters."
D.4.b.(1)(c)(v)	58	Non-Storm Water Discharges Reduction Assessments	Loads will be calculated annually per previous comment, but strategic assessments should not be required more than once per permit term.	Revise Provision D.4.b.(1)(c)(v) as follows: "(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) ~~on an annual basis~~ once per Permit term to:"
D.4.b.(2)(a)(ii)	59	Storm Water Pollutant Discharges Reduction Assessments	Need to ensure timing for reporting will be compatible with completion of assessment. Very important also to reference specifically the assessments that will occur annually (only D.4.b.(c)(i) and (ii)).	Revise Provision D.4.b.(2)(a)(ii) as follows: "(ii) Based on the data collected pursuant to Provision~~s~~ D.2.c., the assessments required under Provisions D.4.b.(2)(c)(i) and (ii) must be included when complete in the ~~first~~ Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter."

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
D.4.b.(2)(b)	59	Storm Water Pollutant Discharges Reduction Assessments	Proposed Wet Weather method for calculation of jurisdictional loads: extrapolate from monitored major MS4 outfalls to area-wide discharge from jurisdictional area within each WMA. Do not extrapolate wet weather data to individual (non-monitored) outfalls, as this is not technically supportable. The proposed method is a more effective means of establishing jurisdictional accountability. Per discussion with RWQCB staff, have consolidated calculation requirements in proposed language, given the added area-based jurisdictional computational approach.	Revise Provision D.4.b.(2)(b) as follows: "(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following: (i) ~~The Copermittees must a~~Analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate storm water volumes and pollutant loads discharged from the MS4s in each Copermittee's jurisdiction within the Watershed Management Area. The Copermittees must calculate or estimate the following for each monitoring year: [a] The average storm water runoff coefficient for each land use type within the Watershed Management Area; [b] The volume of storm water and pollutant loads discharged from each of the Copermittee's ~~major~~ monitored MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; ~~[c] The pollutant loads discharged from each of the Copermittee's major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; and~~ ~~[d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within the drainage basin to each of the Copermittee's major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.~~

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				[c] The total flow volume and pollutant loadings discharged from the Copermittee's jurisdiction within the Watershed Management Area over the course of the wet season, extrapolated from the data produced from the monitored outfalls. (ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify ~~sources~~ pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1)."
D.4.b.(2)(c)	60	Storm Water Pollutant Discharges Reduction Assessments	(c)(ii): Clarify connection to improvement of strategies and Water Quality Improvement Plans in Provision B, and eliminate technically-infeasible ranking of outfalls based on extrapolated wet weather data. (c)(iii): Loads will be calculated annually per previous comment, but strategic assessments should not be required more than once per permit term.	Revise Provision D.4.b.(2)(c) as follows: (c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report the following: (i) The assessments required pursuant to Provision D.4.b.(2)(b); (ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed per Provision B.3, and evaluate whether those analyses and assumptions should be updated as a component of the adaptive management efforts under Provision B.5, ~~rank the MS4 outfalls in the Watershed Management Area according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls~~ for follow-up action to update the Water Quality Improvement Plan; (iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) ~~on an annual basis~~ once per Permit term to:

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
D.4.d.(2)	62	Integrated Assessment of Water Quality Improvement Plan	The integrated assessment should be based on more than one year of data, and strategic assessments should not be required more than once per permit term. Information will be shared among monitoring personnel and stormwater program managers on an ongoing basis, and monitoring data will be used to assess program needs and data gaps annually per prior provisions (c.f., Provisions D.4.b.(c)(i) and (ii), with proposed revisions above). This information will then be used in adopting annual budgets and related resource planning.	Revise Provision D.4.d.(2) as follows: (2) The Copermittees must re-evaluate the water quality improvement strategies for the Watershed Management Area during the term of this Order pursuant to Provision B.5.b. The re-evaluation and recommendations for modifications to the water quality improvement strategies and schedules must be provided in the ~~Annual Reports required pursuant to Provision F.3.b, and provided in the~~ Report of Waste Discharge pursuant to Provision F.5.b. The water quality improvement strategies for the Watershed Management Area must be re-evaluated as follows:
E. Jurisdictional Runoff Management Programs				
E	64	Jurisdictional Runoff Management Programs	Minor grammatical correction in the first sentence.	Revise the first sentence of Provision E as follows: "The purpose of this provision is for each Copermittee to implement a program to control the contribution of pollutants to and the discharges from the MS4 with<u>in</u> its jurisdiction.
E and throughout	64	Jurisdictional Runoff Management Programs	Language should reflect Clean Water Act, which requires Copermittees to effectively prohibit non-stormwater discharges <u>into the MS4</u>; and implement controls to reduce the discharge of pollutants <u>from the MS4</u> to the maximum extent practicable. Language should be used and modified, as appropriate, throughout the Permit for consistency with federal regulations.	Revise the second sentence of Provision E as follows: "The goal of the jurisdictional runoff management programs is to implement strategies that effectively prohibit non-storm water discharges to the MS4 and reduce the discharge of pollutants <u>from the MS4</u> ~~in storm water~~ to the MEP."
E	64	Jurisdictional Runoff Management Programs	Clarify that County of San Diego jurisdictional runoff management program implementation will based on the water quality priorities identified in the Santa Margarita River Watershed Urban Runoff Management Plan (required in Order No. R9-2007-0001) until a Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area is approved.	Add to the first paragraph: "<u>For the Santa Margarita River Watershed Management Area, the County of San Diego shall use the water quality priorities in the Santa Margarita River Watershed Urban Runoff Management Plan (developed pursuant to Order No. R9-2007-0001) to guide jurisdictional runoff management program implementation until notified by the San Diego Water Board that the Water Quality Improvement Plan developed in conjunction with the Riverside Copermittees has been approved</u>."

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
E	64	Jurisdictional Runoff Management Programs	As stated in the introduction to the Provision B (Water Quality Improvement Plans) "The purpose of this provision is to develop Water Quality Improvement Plans that guide the Copermittees' jurisdictional runoff management programs…" However, the provisions do not clearly allow for the appropriate modification of the JRMP requirements (increases, decreases, and/or replacement of activities) contained in the permit, with justification provided and subject to public input, to support adaptive management of programs.	Include language into the introductory provision that clearly indicates that the JRMP requirements contained in Provision E may be modified to allow for implementation of the JRMP consistent with the Water Quality Improvement Plan if appropriate justification is provided. In addition, add the following: Modification of Jurisdictional Runoff Management Program Requirements Modifications shall be considered and where selected, proposed according to the process in Provision B.5. Proposed modifications may increase, decrease, and/or replace minimum requirements identified in Provision E.
E.1.a.	64	Legal Authority Establishment and Enforcement		Revise text as follows: "… to control pollutant discharges ~~into and~~ from its MS4"
E.1.a.(2)	64	Legal Authority Establishment and Enforcement	Sites regulated under the Construction and Industrial General Permits are regulated elsewhere and through alternative means. Clarification is necessary for sites that are not regulated under the respective General Permits.	Revise Provision E.1.a.(2) as follows: "Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4 and control the quality of runoff from industrial and construction sites that do not~~, including industrial and construction sites which~~ have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit)~~, as well as to those sites which do not~~; "
E.1.a.(4) E.1.a.(5)	64 64	Legal Authority Establishment and Enforcement	The Copermittees do not have jurisdiction to control MS4 discharges outside of their respective MS4s and the Regional Board does not have the authority to require interagency agreements to grant such jurisdiction, particularly for those agencies not subject to the Order (Caltrans, Native American Tribes, Military installations,	Revise Provision E.1.a.(4) and E.1.a.(5) as follows: ~~"Control through interagency agreements among Copermittees the contribution of pollutants from one portion of the MS4 to another portion of the MS4;"~~ and ~~"Control, by coordinating and cooperating with other owners of the MS4 such as Caltrans, the U.S. federal~~

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			etc.).	~~government, or sovereign Native American Tribes, through interagency agreements, where possible, the contribution of pollutants from their portion of the MS4 to the portion of the MS4 within the Copermitee's jurisdiction;"~~ "Coordinate, as possible, with other agencies to minimize the contribution of pollutant discharges from the Copermittee's portion of the MS4 to portions of the MS4 under another agency's jurisdiction and from other agency's portions of the MS4 to the portion of the MS4 under the Copermittee's jurisdiction"
E.2.a	65	Non-Storm Water Discharges	The addition of "to the extent allowable by law", as referenced from the Phase II Regulations, limits Copermittees responsibility to those that they have the legal authority to implement. Copermittees cannot implement programs outside of what they have legal authority to do. In addition, some non-storm water discharges are authorized under the permit unless the Copermittee or San Diego Water Board determines they are a source of pollutants in receiving waters of the U.S., as consistent with 40 CFR 122.26(d)(2)(iv)(B)(1). Language should be provided to account for subsection E.2.a.(3).	Revise Provision E.2.a. as follows: "To the extent allowable by law, ~~E~~each Copermittee must address all non-storm water discharges as illicit discharges, where the likelihood exists that they are a source of pollutants to waters of the U.S."
E.2.a.(1)	66	Non-Storm Water Discharges	Uncontaminated pumped groundwater is the only category under this Provision that is required to be permitted under an NPDES Permit. It should be added to the initial paragraph and the remainder of the bullets should be added to E.2.a.(3), as consistent with 40 CFR 122.26(d)(2)(iv)(B)(1). No justification is provided in the fact sheet for inclusion of discharges from foundation drains, water from crawl space pumps, or from footing drains as requiring NPDES permits for the entire region. This exceeds CWA standards and there is no evidence that the Regional Board has considered the economic cost of enacting such measures under this permit. The reasoning provided in the fact sheet cites 40 CFR 122.26(d)(2)(iv)(B)(1), applicable to	Revise Provision E.2.a.(1) as follows: "Discharges of non-storm water to the MS4 from uncontaminated pumped groundwater ~~the following categories~~ must be addressed as illicit discharges where there is evidence that suggests that they are the source of pollutants to waters of the U.S., unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay: ~~(a) Uncontaminated pumped ground water;~~

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			"receiving waters of the US". Groundwater is not a receiving water of the US and, thus, the added footnote is inapplicable and inappropriate. While "the Director may include permit conditions that either require municipalities to prohibit or otherwise control any of these discharges where appropriate" (55 FR 48037), there is no justification provided to support these discharges as appropriate to require NPDES permits or that they have been "identified by the municipality [or the Regional Board] as sources of pollutants to waters of the United States". 40 CFR 122.26(d)(2)(iv)(B)(1). Water from foundation drains, crawl space pumps, and footing drains has not been identified as a source of pollutants to waters of the US and should be included under Provision E.2.a.(3). The footnote is inapplicable since groundwater is not a water of the US. In the future, based on data collected through the Monitoring Program and as part of the Water Quality Improvement Plan, Copermittees or the Regional Board may include any category of discharges determined to be a source of pollutants based on evidence that such discharge is causing or contributing pollutants to the receiving waters through the MS4. The "blanket" prohibition of the listed sources creates an unnecessary burden and potentially costly requirement that may yield little if any benefit. Footnotes 19 and 20 (E.2.a.3) provide a technical/engineering distinction between types of groundwater discharges that has no direct linkage to pollutants. Furthermore, it is unlikely that the location of the pipes and other features will be identifiable in the field or in any records; making it a burdensome investigative effort for discharges having no impact on water quality. Lastly, there are no reliable and readily available records (or a definition)	~~(b) Discharges from foundation drains[19];~~ ~~(c) Water from crawl space pumps; and~~ ~~(d) Water from footing drains[19]."~~ And delete Footnotes 19 and 20.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			for the “highest historical groundwater table”.	
E.2.a.(2)	66	Non-Storm Water Discharges	Limit to within the Copermittee’s jurisdiction per prior comments and reword the applicable permitting portion to allow flexibility for any subsequent NPDES permits that may be issued.	Revise Provision E.2.a.(2) as follows: "Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under a valid NPDES Permit, ~~No. CAG 679001 (~~Order No. R9-2010-0003, or a subsequent order~~)~~. This includes water line flushing and water main break discharges from water purveyors under the Copermittee’s jurisdiction that have been issued a water supply permit by the California Department of Public Health or federal military installations."
E.2.a.(3)	66-67	Non-Storm Water Discharges	Non-storm water sources should be limited to anthropogenic sources of pollutants within the Copermittees jurisdiction to enable to Copermittees to address those sources in which they have control over. Also, see comment E.2.a.1.	Revise Provision E.2.a.(3) as follows: Limit the source of pollutants in receiving waters to anthropogenic sources identified as an illicit discharge within the Copermittees jurisdiction and add water from crawl space pumps. In addition, remove footnote 19.
E.2.a.(4)	67	Non-Storm Water Discharges	See comment E.2.a, as consistent with 40 CFR 122.26(d)(2)(iv)(B)(1).	Revise Provision E.2.a.(4) as follows: Add “or similar means where the Copermittee of the San Diego Water Board identifies those discharges as a source of pollutants to waters of the U.S.”
E.2.a.(4)(a)	67	Non-Storm Water Discharges	Individual buildings may require substantial structural modifications to redirect air conditioning condensation to landscaped areas. Redirection should be encouraged instead of required. In addition, air conditioning condensate should be permitted to be directed to the sanitary sewer.	Revise Provision E.2.a.(4)(a) as follows: “The discharge of air conditioning condensation ~~must~~ should be directed to landscaped areas, other pervious surfaces where feasible, or to the sanitary sewer;”
E.2.a.(4)(b)	67	Non-Storm Water Discharges	Complete removal of residential car washing activities is unrealistic and resources would be better used to educate the public. Public outreach has proven to be also effective in minimizing water and detergent use and encouraging the use of commercial facilities.	Revise Provision E.2.a.(4)(b) as follows: “~~(i)~~ The discharge of wash water must be encouraged through public outreach and education (i) to be directed to landscaped areas or other pervious surfaces where feasible, and (ii) to m~~M~~inimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible, wash vehicles at commercial wash facilities, and implement other practices or behaviors that will prevent the discharge of pollutants associated with

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				individual residential vehicle washing from entering the MS4; and”
E.2.a.(4)(c)	67	Non-Storm Water Discharges		Revise Provision E.2.a.(4)(c) as follows: “Dechlorinated swimming pool discharges <u>should be managed as to:</u>”
E.2.a.(5)(a)(i)	68	Non-Storm Water Discharges	Building fire suppression system maintenance discharges should not be considered an illicit discharge if BMPs are implemented to prevent discharge of pollutants to the MS4.	Revise Provision E.2.a.(5)(a)(i) as follows: Add “<u>unless BMPs are implemented to prevent the discharge of pollutants to the MS4.</u>”
E.2.a.(7)	68	Non-Storm Water Discharges	Allowable discharges should not be treated the same as illicit discharges. This requirement will limit the Copermittee’s ability to focus on priorities identified in Water Quality Improvement Plan and focus resources that could be used for reduction of illicit discharges on authorized discharges. This standard is more stringent than that applied by the State to Areas of Special Biological Significance.	Revise Provision E.2.a.(7) as follows: “Each Copermittee must, where feasible, reduce or <u>effectively</u> eliminate non-storm water discharges listed under Provisions E.2.a.(1)-(4) into its MS4 ~~whether or not the non-storm water discharge has been identified as an illicit discharge~~, unless a non-storm water discharge is identified as a discharge authorized by a separate NPDES permit.”
E.2.b.(1)(d)	69	Prevent and Detect Illicit Discharges and Connections	MS4 and Private Outfalls should be clearly defined consistent with the Code of Federal Regulations.	Revise Provision E.2.b.(1)(d) as follows: “All known locations of <u>Major</u> MS4 outfalls and private outfalls that discharge runoff collected from areas within the Copermittee’s jurisdiction,”
E.2.b.(4)	69-70	Prevent and Detect Illicit Discharges and Connections	Spill response should be limited to waters of the U.S. and is not applicable to soil contamination under an NPDES permit.	Revise Provision E.2.b.(4) as follows: “Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills that may discharge into the MS4 within their jurisdiction from any source. The Copermittee must coordinate with spill response teams to prevent to the extent possible entry of spills into the MS4, and prevent contamination of <u>waters of the U.S.</u> ~~surface water, ground water, and soil~~.”
E.2.b.6	70	Prevent and Detect Illicit Discharges and Connections	Copermittees cannot control other agencies or MS4s outside their jurisdiction.	Revise Provision E.2.b.(6) as follows: "(6) Each Copermittee <u>shall</u> ~~must~~ coordinate, when necessary, with upstream Copermittees and/or entities to prevent illicit discharges from upstream sources into the MS4 within its jurisdiction."
E.2.d.(1)(d)	70	Investigate and Eliminate Illicit	Natural sources should be excluded to prevent diversion of resources for follow-ups on exceedances where the source	Revise Provision E.2.d.(1)(d) as follows: “Pollutants identified as causing or contributing to an

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Discharges and Connections	has been determined as natural, versus focusing efforts on controllable sources.	exceedance of a NAL in the Water Quality Improvement Plan where the source has not been identified as natural; and"
E.2.d.(2)	71	Investigate and Eliminate Illicit Discharges and Connections	TCBMPs may be part of the MS4 and specifically designed to receive and contain pollutants. The language, as written, is inconsistent with the TCBMP requirements prescribed in Provision E.3.a of the proposed permit.	Revise Provision E.2.d.(2) as follows: "Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that, based on reports or notifications, field screening and monitoring, or other appropriate information, indicate a reasonable potential of ~~receiving, containing, or~~ discharging pollutants to receiving waters within the Copermittees jurisdiction due to illicit discharges, illicit connections, or other sources of non-storm water."
E.2.d.(2)(c)	71		Clarify requirements for follow-up investigations on non-Storm Water flows; ensure consistency with Provision D and earlier Provision E requirements.	Revise Provision E.2.d.(2)(c) as follows: "(c) In accordance with the procedures defined in Provision E.2.d.(1), ~~E~~ each Copermittee must investigate and seek to identify the source(s) of discharges of non-storm water where flows are observed in and from the MS4 during the field screening required pursuant to Provision D.2.b.(1) as follows: (i) Obvious illicit discharges (i.e., unusual color or odor) must be immediately investigated to identify the source(s) of non-storm water discharges; "
E.2.d.(2)(d)(ix)	72	Investigate and Eliminate Illicit Discharges and Connections	The requirement to provide "a rationale for why a discharge does not pose a threat to water quality and/or does not require additional investigation" is not consistent with E.2.d.(3).	Revise Provision E.2.d.(2)(d)(ix) as follows: "(ix) If a source cannot be identified and the investigation is not continued, document the response per the requirements of Provision E.2.d.(3)~~a rationale for why a discharge does not pose a threat to water quality and/or does not require additional investigation."~~
E.2.d.(2)(e)	72	Investigate and Eliminate Illicit Discharges and Connections	Clarify requirements for follow-up investigations on non-Storm Water flows; ensure consistency with Provision D and earlier Provision E requirements. In addition, the example of "pooled" water is an unreasonable expectation based on over 10 years of dry weather monitoring data collected by the Copermittees that	Revise Provision E.2.d.(2)(e) as follows: " (e) Each Copermittee must ~~track~~ document and, if readily identifiable in accordance with Provision E.2.d.(1) procedures, seek to identify the source(s) of non-storm water discharges from the MS4 where there is evidence of non-storm water having been discharged into or from the MS4 (e.g., ~~pooled~~ flowing water), in accordance with MS4

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			clearly demonstrates the presence of pooled water in parts of the MS4 where no illegal or illicit discharges can be found after exhaustive investigations. Pooled water may result from past storm discharges due to minor imperfections or settling of the MS4 infrastructure. Flowing water should be set as the standard for investigating illicit or illegal discharges instead of pooled water.	outfall discharge monitoring requirements in Provisions D.2.a.(2) and D.2.b."
E.3	73	Development Planning	The Provisions of E.3 regulating storm water flow exceed the requirements of federal law. See <u>Virginia Department of Transportation v. U.S. EPA</u>, Civil Action No. 1:12-CV-775 (E.D. Va. Jan 3, 2013) (holding that EPA exceeded its authority under the Clean Water Act when it regulated storm water flow as a "surrogate" for pollutant discharges).	Acknowledge that affected provisions of E.3 regulating storm water flow exceed federal law.
E.3	73	Development Planning	No jurisdictional limitations are provided in this section. As a result, language in the subsections may be interpreted as expanding Copermittee requirements outside their MS4 jurisdiction. In addition how the Copermittees implement their program should be a decision left to the Copermittees. In rare instances a requirement listed within the permit may not be legal for the jurisdiction to impose upon an applicant.	Revise Provision E.3. as follows: "Each Copermittee<u>, within their respective jurisdictions and to the extent that they may lawfully impose requirements,</u> must ~~use their land use and planning authorities to~~ implement a development planning program…"
E.3.a	73	BMP Requirements for All Development Projects	Added language to clarify that not all the prescribed BMPs in Provision E.3.a. are applied to every project. These BMPs are applied as practical and feasible and as applicable based on the sites condition and nature of development.	Revise Provision E.3.a. as follows: "Each Copermittee<u>, as practical and feasible,</u> must prescribe the following BMP requirements during the planning process (i.e. prior to project approval and issuance of grading or building permits) for all development projects (regardless of project type or size), where local permits are issued, including unpaved roads and flood management projects<u>, except emergency projects implemented for the protection of persons and property</u>:"

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
E.3.a.(1)(b)	74	BMP Requirements for All Development Projects	Include "unless authorized by the San Diego Water Board Executive Officer" because Hydromodification Mitigation may need to occur within receiving waters to address watershed water quality issues. This aligns with Regional Board staff suggestion that the 401 permit process should be streamlined to allow alternative compliance opportunities to mitigate and/or improve water quality conditions within a waterway. Delete "waters of the state". According to the definition of "Waters of the State," "<u>all</u> water in the State is considered to be Waters of the State". Thus the MS4 itself could be considered waters of the state and therefore structural BMPs cannot be constructed within the MS4. Therefore a stormdrain filter insert would be prevented, as would a bioretention device or basin holding state waters. The intent is to protect natural receiving waters, not to prevent the use of structural BMPs in the MS4. Removing "or waters of the state" will protect the natural receiving waters from construction and will protect the receiving waters from potential MS4 pollution.	Revise Provision E.3.a.(1)(b) as follows: "Structural BMPs must not be constructed within a waters of the U.S. <u>unless authorized by the San Diego Water Board Executive Officer</u>~~or waters of the state~~."
E.3.b.(1)(b) and E.3.b.(1)(c)	75	Definition of Priority Development Project	Since SUSMP requirements have been in effect since 2001, will start seeing some redevelopment projects that were subject to previous SUSMPS. Therefore, the 50% rule for redevelopment projects should apply only to projects that were not subject to any previous SUSMP requirements.	Revise Provision E.3.b.(1)(b) as follows: "Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site, and the redevelopment project is a Priority Development Project category listed under Provision E.3.b.(2)… where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development<u> and was not subject to previous Priority Project Development requirements</u>…". Add Provision E.3.b.(1)(c) as follows: <u>(c) Projects where redevelopment results in an increase of more than fifty percent of impervious surfaces of a</u>

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				previously existing development, and the existing development was subject to previous Priority Project Development Requirements, only the altered portion of development is subject to the new Priority Development Project requirements."
E.3.b.(2)	76	Priority Development Project Categories	Considerable staff resources are spent on understanding the complex set of rules in order to correctly apply them to each project. A simpler set of rules for the determination of whether or not a project is a Priority Development Project will greatly improve government efficiency and allow more focus on reviewing the project's compliance with performance requirements, thus resulting in greater overall Permit effectiveness. The proposed change is consistent with the current draft, while making the rules simpler. The definitions of each category are in Appendix C.	Delete items b through h and replace with the following: " (b) Development projects that create 5,000 square feet or more of impervious surfaces (collectively over the entire project site), and support one or more of the following uses (see Appendix C for definitions): i. Automotive repair shop ii. Restaurant iii. Parking lot iv. Street, road, highway, freeway and driveway v. Retail gasoline outlet (RGO) (c) Development projects that create 2,500 square feet or more of impervious surfaces (collectively over the entire project site) and where the project will directly discharge to an Environmentally Sensitive Area (see Appendix C for definitions)."
E.3.b.(2)(d)	76	Priority Development Project Categories	A separate Hillside Development category is unnecessary and redundant. Projects that grade on a natural slope that is twenty-five percent or greater require special consideration during the construction stage of the project, which is addressed elsewhere in the Permit. Local ordinances are very strict about adequate post-construction stabilization of hillside areas. Development projects that drain to a slope of sensitive habitat will be subject to the Environmentally Sensitive Area category. Removal of this category will facilitate the establishment of simpler rules as described above, while still keeping the same level of standards.	Delete this Provision.
E.3.b.(2)(e)	76	Priority Development Project Categories	The definition of a direct discharge has been established to mean that the project is releasing flows directly into the receiving water. If the project drains into an MS4 connection	If comment E.2.b.(2) is not incorporated, revise the last sentence of Provision E.3.b.(2)(e) as follows: "…means outflow from a drainage conveyance system

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			which serves existing developed areas before discharging to receiving water, this is not a direct discharge. Added language for clarification.	that collects runoff from the subject development or redevelopment site <u>not commingled with flows from adjacent</u> lands and terminates at or in receiving waters within the ESA."
E.3.b.(2)(g)	76	Priority Development Project Categories	This requirement was present in the prior permit; however, the residential driveways clause was added under the proposed permit. Including residential driveways as a PDP will require unnecessary, burdensome PDP process without proportional water quality benefits. Driveways experience low daily traffic trips compared to highways and roads.	If comment E.2.b.(2) is not incorporated, revise Provision E.3.b.(2)(g) as follows: "Streets, roads, highways, <u>and</u> freeways, ~~and driveways~~. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles."
E.3.b.(3)(a)	77	Priority Development Project Exemptions	The three methods listed as adequate for mitigating the minimal impacts that sidewalks, bicycle lanes and trails would have upon receiving waters should also be applied to driveways. Driveways typically have only very light vehicle usage and because they are linear it is possible to be very effective at removing pollutants and reducing runoff by techniques such as sloping the driveway toward a sufficiently sized landscape area and disconnecting from the MS4. The San Diego Model SUSMP currently has specific design parameters for controlling this type of design to ensure adequate effectiveness, and the BMP Design Manual Update that is require as part of this permit can further improve these design parameters using the latest information such as recent studies by Caltrans on the effectiveness of vegetated filter strips adjacent to major highways. The Manual's detailed design guidance on effective practices will allow an "over the counter" design review, rather than subjecting the public to unnecessarily burdensome requirements to submit the extensive technical documents that accompany more significant projects.	Add "<u>driveways</u>" to the list of project types that can qualify for this exemption.
E.3.b.(3)(b)	77	Priority Development Project Exemptions	All municipal roadway projects should only be subject to the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets.	Replace the current language in Provision E.3.b.(3)(b) as follows: <u>"Any paved impervious surface that is 5,000 square feet</u>

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			The Ventura County NPDES MS4 Permit, the Santa Ana Region permits for Orange County, San Bernardino County, and Riverside County, and the Greater Los Angeles MS4 Permit provide that streets, roads, and highways follow USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets to the maximum extent practicable. Roadways are different than other development projects as there are significant constraints to implementation of BMPs that need to be considered such as limited right-of-way, utilities, geotechnical and structural concerns, street trees, parking, and fire truck access among others. The USEPA guidance considers these constraints where the PDP requirements do not. Even in new roadways implementing hydromodification requirements can disturb a significant area of land which has its own environmental impacts including changing the natural hydrology which is antithetical to the LID approach.	or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles that follows the USEPA guidance regarding Managing Wet Weather with Green Infrastructure: Green Streets, or equivalent standards, to the maximum extent practicable." ~~(b) Retrofitting of existing paved alleys, streets or roads that meet the following criteria:~~ ~~(i) Must be two lanes or less; AND~~ ~~(ii) Must be a retrofitting project implemented as part of an alternative compliance project option under Provision E.3.c.(3)(b)(v) to achieve the performance requirements of Provisions E.3.c.(1) and/or E.3.c.(2) for a Priority Development Project; AND~~ ~~(iii) Designed and constructed in accordance with the USEPA Green Streets guidance.[24]~~
E.3.b.(3)(c)(ii) E.3.b.(3)(c)(iii)	77 78	Priority Development Project Exemptions	Provide more flexibility for a jurisdiction to accept other comparable certification standards. In some cases a project may be already pursuing a certification from a different organization (such as Envision or SITES) and they should be allowed to get their credits that way rather than having to additionally comply with a second set of certification requirements. In addition, specifying "structural" BMPs is unnecessary. These types of projects could meet the performance requirements using non-structural BMPs.	Revise Provisions E.3.b.(3)(c)(ii) and E.3.b.(3)(c)(iii) and add a Provision (iv) as follows: "(ii) Designed and constructed ~~to be certified~~ to meet requirements for certification under the U.S. Green Building Council (USGCB) Leadership in Energy and Environmental Design (LEED) for Homes green building certification program, receiving at least four (4) Surface Water Management credits under the Sustainable Sites category, or other locally accepted certification of equivalent effectiveness; ~~OR~~ (iii) Designed and constructed with ~~structural~~ BMPs that will achieve ~~the~~ equivalent performance to the requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite, OR

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				(iv) Designed and constructed with structural BMPs that meet minimum performance standards, as outlined in the BMP Design Manual."
E.3.b.(3)(c)(iv)	78	Priority Development Project Exemptions	This exemption allows small individual residential projects to apply minimum BMPs that meet a minimum performance standards without going through the burdensome PDP review and approval process including; preparation of a full PDP study, and maintenance, verifications, and inspection of permanent treatment control BMPs. Under the current proposed language, single family residence as small as 5,000 sf may be subject to PDP requirements, and is lumped in with industrial and commercial development; The potential pollutants generated by small residential are not as significant as industrial or commercial and can be effectively reduced by effective source control and minimum permanent BMPs.	Add Provision E.3.b.(3)(c)(iv)as follows: "(iv) Designed and constructed with structural BMPs that meet minimum performance standards, as outlined in the BMP Design Manual."
E.3.b.(3)(d)(i) E.3.b.(3)(d)(ii)	78	Priority Development Project Exemptions	See comments for E.3.b.(3)(c)(ii) and E.3.b.(3)(c)(iii).	Revise Sections E.3.b.(3)(d)(i) and E.3.b.(3)(d)(ii) and add a Provision (iii) as follows: "(i) Designed and constructed ~~to be certified~~ to meet requirements for certification under the U.S. Green Building Council (USGCB) Leadership in Energy and Environmental Design (LEED) for Homes green building certification program, receiving at least four (4) Surface Water Management credits under the Sustainable Sites category, or other locally accepted certification of equivalent effectiveness; OR (ii) Designed and constructed with ~~structural~~ BMPs that will achieve ~~the~~ equivalent performance to the requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite~~.~~; OR (iii) Designed and constructed with structural BMPs that

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				meet minimum performance standards, as outlined in the BMP Design Manual."
E.3.c	78	Priority Development Projects Structural BMP Performance Requirements	Water Quality Improvement Plans allow Copermittees to define priorities on a watershed basis and to tailor programs and BMPs based on the specific needs of each watershed. The structural BMP performance requirements are an example of a prescriptive one-size-fits-all approach. The sizing criteria are the same for all projects regardless of pollutant removal efficiencies, soil retention capacities, or susceptibility to erosion. Encouraging watershed-specific performance requirements to be developed within the Water Quality Improvement Plans will allow for watershed specific flexibility while providing the same level of protection needed.	Revise Provision E.3.c as follows: "In addition to the BMP requirements listed for all development projects under Provision E.3.a, Priority Development Projects must also implement structural BMPs that conform to performance requirements below. Alternatively, watershed-specific performance requirements may be developed as part of a Water Quality Improvement Plan; these requirements would replace the general performance requirements below. Watershed-specific requirements must provide at least equivalent protection as the general performance requirement below."
E.3.c.(1)(a)(ii)	78	Storm Water Pollutant Control BMP Requirements	Language should be consistent with pre-project language used in Provision E.3.c.(2)(a).	Revise Provision E.3.c.(1)(a)(ii) as follows: "The volume of storm water that would be retained onsite prior to the project ~~if the site was fully undeveloped and naturally vegetated~~, as determined using continuous simulation modeling or other techniques based on site-specific soil conditions and ~~typical native~~ vegetative cover."
Footnote 26	78	Storm Water Pollutant Control BMP Requirements	Include language to clarify that the 85th design capture volume refers to first flush and it is a particular volume that corresponds to 85 percent of all the rain events for the area.	Revise Footnote 26 as follows: "Where the Copermittees will use isopluvial maps to determine the 85^{th} percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals. The volume is a single event-based volume that occurs after an extended dry period."
E.3.c.(2)(a)	80	Hydromodification Management BMP Requirements	The Tentative Order proposed requirement to match predevelopment hydrographs (flow rates and duration) is the exception to the current hydromodification requirement found in other parts of the state. Specifically, the following permits/programs require hydromodification controls to match pre-project conditions: Region 2, Region 4, Region	Revise Provision E.3.c.(2)(a) as follows: "Post-project runoff flow rates and durations must not exceed pre-project ~~development (naturally occurring)~~ runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion, or degraded instream habitat conditions

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			5, Region 8, Caltrans and draft Phase 2 MS4. Region's 4 MS4 permit, Order No. R4-2012-0175 was recently adopted on November 8, 2012. Thus, there is very recent precedent to use pre-project conditions as a reference for hydromodification. Additionally, requiring matching the predevelopment hydrograph may impose mitigation beyond a project's impacts. Pre-project standard is the appropriate nexus to project impacts. In the case of new development, where open land is to be converted to impervious area, the hydromodification controls are required to match the pre-project condition, which equates to the pre-development, naturally occurring, condition. In these situations the pre-development conditions were based on Natural Resources Conservation Service soil maps and existing topography and vegetation. In cases where redevelopment projects increase impervious area as compared to the existing condition, hydromodification controls were required to mitigate for the impacts of the added impervious surfaces. The San Diego Copermittees have invested considerable time and resources to develop a technically sound and defensible hydromodification management plan (HMP). The San Diego Copermittees determined, during the development of the San Diego HMP, that the flow control design criteria should be based on flow duration matching to the pre-project condition and not the pre-development condition. This determination was made based upon the following. • Prior HMP implementation precedent in the State of California, specifically in Santa Clara and Contra Costa Counties, mandated flow duration matching to the pre-project condition. • Following consultation with leading geomorphologists in	downstream of Priority Development Projects)."

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			the State of California, the San Diego Copermittees determined that in areas of significant existing urbanization the receiving streams had shown an ability to attain a new channel equilibrium based upon the developed flow conditions. • Redevelopment practices often decrease the existing site's impervious area, especially with the 2007 Low Impact Development (LID) requirements. In such cases, the post-project site impervious area contributing to the receiving stream would be smaller and, based on the improvement relative to pre-project conditions, no hydromodification requirements would be required. • The Copermittees stated a desired goal of encouraging redevelopment projects for multiple planning, economical, and water quality purposes. From a hydromodification perspective, increasing redevelopment project implementation would invariably decrease the conversion of existing open space. The Copermittees were careful to avoid implementing hydromodification requirements on beneficial redevelopment projects if the redevelopment project decreased the site impervious area as compared to existing conditions. San Diego Copermittees have worked closely with Southern California Coastal Water Research Project (SCCWRP) during the development of the HMP. SCCWRP published technical report 667, Hydromodification Assessment and Management in California, dated April 2012. This report describes the "flow-duration control standards…require that the post-project discharge rates and durations may not deviate above the pre-project discharge rates and durations by more than a specific percent…and this approach is a dramatic improvement over earlier methods."	

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Furthermore, the Copermittees are concerned that using "pre-development (naturally occurring)" reference condition as applied to sites that are, in fact, developed would expose the Copermittees to significant litigation risk and may be unenforceable. We are concerned this would subject the Copermittees to liability under the takings clauses of the U.S. and California Constitutions and the Mitigation Fee Act because of the questionable nexus between a project's impacts on hydromodification and the hydromodification management measures in the Draft Tentative Order. When imposing a condition on a development permit, a local government is required under the federal and state constitutions to establish that the condition bears a reasonable relationship to the impacts of the project. This rule applies even to legislatively enacted requirements and impact fees or exactions.[1]Moreover, fees imposed on a discretionary ad hoc basis are subject to heightened scrutiny under a two-part test. First, local governments must show that there is a substantial relationship between the burden created by the impact of development and any fee or exaction.[2] Second, a project's impacts must bear a "rough proportionality" to any development fee or exaction.[3] Under California law, the *Nollan/Dolan* heightened scrutiny test also applies to in-lieu fees.[4] The Legislature has memorialized these requirements in the Mitigation Fee Act which establishes procedures that local governments must follow to impose impact fees.[5] Irrespective of whether the hydromodification management

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			requirements are implemented by legislative act or on an ad hoc basis, the Copermittees' attempt to enforce them as proposed in the Tentative Order would likely result in claims alleging unconstitutional takings of private property and violations of the Mitigation Fee Act. This is because a developer could argue that limiting hydromodification impacts of already developed property to its "naturally occurring" state would not have a legally sufficient nexus to the impact of the development project.	
E.3.c.(2)(a)(ii)	80	Hydromodification Management BMP Requirements	A stable, naturally vegetated channel is a balance of sediment supply, channel geometry, longitudinal slope, channel material and size, and type, size and cover of channel vegetation. When a concrete channel is restored it is not just a process of removing the concrete. A naturally vegetated channel must be engineered in a configuration that will not be subject to hydromodification from the existing and any future discharges that may occur in the channel. This requires a larger channel cross Provision to convey flood control peak discharges, usually a wider channel and sometimes grade control structures. These existing concrete channels are typically in urbanized areas. Since the naturally vegetated channel must be engineered to convey all flows, additional hydromodification controls in the watersheds draining to these channels would provide no benefit at significant construction and perpetual maintenance costs.	Delete Provision E.3.c.(2)(a)(ii). ~~For artificially hardened channels, analysis to identify the lower boundary must use characteristics of a natural stream segment similar to that found in the watershed. The lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or erodes the toe of the channel banks.~~
E.3.c.(2)(b)	80	Hydromodification Management BMP Requirements	The current Tentative Order language as written is unclear and implies that each development project will be required to conduct studies and compensation for the loss of sediment supply specifically on site. However, the ability to compensate for the loss of sediment supply has not yet been fully researched, nor have practices yet been	Revise Provision E.3.c.(2)(b) as follows: <u>"In accordance with the BMP Design Manual, projects shall preserve or provide compensation for significant losses of sediment supply anticipated as a result of development.</u> ~~Post project runoff flow rates and durations~~

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			developed. Therefore the ability to require sediment compensation on a project by project basis is not yet validated or possible. SCCWRP technical report 667 cites that management approaches to compensate for the loss of sediment supply are necessary but "continues to prove challenging because, the effects of urban development on sediment supply in different geologic settings are not well understood and poorly represented in current models." The proposed change would allow the Copermittees to study and adapt to how sediment supply should appropriately be managed. Research may determine that sediment compensation would be addressed more appropriately on a regional or local level. The BMP Design Manual is a suitable mechanism to handle this evolving science over time, where the Copermittees can specify requirements and update the plan and practices as research advances.	~~must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project."~~
E.3.c.(2)(d)(i) through (iii)	80	Hydromodification Management Exemptions	The permit should clearly reference the recently Board adopted Resolution No. R9-2010-0066, a Resolution for Approval of the Hydromodification Management Plan for the San Diego County. The SD Copermittees developed a technically sound HMP with a Technical Advisory Committee (TAC) and input from all stakeholders. This HMP has only been in effect for two years. In accordance with the adopted resolution, the SD Copermittees have embarked on a 5-year monitoring project to validate the HMP parameters and design criteria. The SD Copermittees are not aware of any current scientific data that would suggest the SD HMP is no longer effective or needs adjustment prior to the completion of their current monitoring project. It is appropriate to incorporate the approved resolution authorizing the SD HMP into the Permit and allow implementation and monitoring during this Permit cycle.	Revise Provision E.3.c.(2)(d) as follows: "(i) Discharges storm water runoff into existing underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, tidally influenced waters, or the Pacific Ocean; (ii) Discharges stormwater runoff into conveyance channels whose bed and bank are stabilized (e.g. concrete lined, an engineering interlocking paver, gabion system, etc.) all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, tidally influenced waters, or the Pacific Ocean; ~~(ii)~~ (iii) Is a redevelopment Priority Development Project that meets the alternative compliance requirements of Provision E.3.c.(3)(b)(ii); or

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				~~(iii)~~ (iv) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt, including those exemptions recognized in the 2010 San Diego Hydromodification Plan, approved by the San Diego Water Board Resolution No. R9-2010-0066, from the requirements of Provisions E.3.c.(2)(a)-(b). "
E.3.c.(3)	80	Alternative Compliance to Onsite Structural BMP Performance Requirements	The proposed language allows the alternative compliance program to be optional and gives Copermittees the discretion to exercise the program if it is determined to be beneficial and practical for the municipality. The permit as currently written could create an expectation that the Copermittees manage offsite mitigation for private developments. There are many factors to be considered when administering a mitigation program, including: overhead program management and administrative costs, availability of land, long term maintenance responsibilities and costs, variability and lack of accurate cost estimates for BMP construction and maintenance costs.	Revise Provision E.3.c.(3) as follows: "(3) Alternative Compliance to Onsite Structural BMP Performance Requirements Alternative compliance is an optional program for each jurisdiction to utilize if it is determined to provide an equivalent or greater benefit to the watershed than onsite compliance. Where alternative compliance is allowed, the determination of the responsible party to execute the onsite alternative compliance is at the jurisdiction's discretion and in accordance with policies set in place in the individual jurisdiction or in coordination with other jurisdictions, agencies, or Copermittees:"
E.3.c.(3)(a)(i)	81	Alternative Compliance to Onsite Structural BMP Performance Requirements-Applicability		Revise text as follows: "…implementation of the alternative compliance option will have an equal or greater overall water quality benefit…"
E.3.c.(3)(a)(ii)	81	Alternative Compliance to Onsite Structural BMP Performance Requirements-Applicability	Stream rehabilitation projects should be designed by a biologist and/or a hydrologist. Other certified professionals may have more specific knowledge to a particular stormwater design than an engineer or architect. Other applicable certifications could include LEED, QSD, CPESC, CPSWQ, Envision, SITES, or certifications that do not currently exist but may exist in the future.	Revise Provision E.3.c.(3)(a)(ii) as follows: The alternative compliance options must be designed by a registered professional engineer, geologist, architect, biologist, hydrologist, landscape architect, or other appropriate certified professional;
E.3.c.(3)(a)(iii)	81	Alternative Compliance to Onsite Structural	To be consistent with E.3.c.(3)(a)(i) which requires alternative compliance with greater water quality benefit for the Watershed Management Area.	Revise Provision E.3.c.(3)(a)(iii) as follows: The alternative compliance options must be implemented within the same ~~hydrologic unit~~ Watershed Management

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		BMP Performance Requirements-Applicability		Area as the Priority Development Project, and preferably within the same hydrologic subarea;
E.3.c.(3)(a)(iv)	81	Alternative Compliance to Onsite Structural BMP Performance Requirements-Applicability	This language suggests that the alternative compliance must be downstream of the PDP. However, this may not be necessary if HMP improvement is needed in the upper watershed instead of the lower watershed. SCCWRP Technical Report 667 concludes that "hydromodification management should be considered in the context of an overall watershed-scale strategy that targets maintenance and restoration of critical processes in the critical locations in the watershed." However, the current language in the tentative order limits the ability to utilize alternative compliance, including using a regional BMP constructed to mitigate for increases in flow. All PDPs must treat for water quality to the MEP to prevent polluted stormwater from entering MS4 and receiving waters. (vi) and (vii) sufficiently protect the watershed as a whole. Delete this language to remove this conflict.	Delete Provision E.3.c.(3)(a)(iv). ~~Receiving waters must not be utilized to convey storm water runoff to the alternative compliance options~~
E.3.c.(3)(a)(v)	81	Alternative Compliance to Onsite Structural BMP Performance Requirements - Applicability	Without deletion this would render Alternative Compliance through E.3.c(3)(b)(v) invalid as it would mean that all runoff from a PDP must be treated by Alternative Compliance that is physically in series with the PDP and not a separate site discharging to the same watershed as described in E.3.c(3)(a)(iii).	Delete Provision E.3.c.(3)(a)(v). ~~The pollutants in storm water runoff from the Priority Development Project must be treated to the MEP by the alternative compliance options prior to being discharged to receiving waters~~
E.3.c.(3)(b)(ii)	82	Alternative Compliance Project Options	This is an exemption listed in E.3.c.(2)(d)(ii). Other locally accepted certification programs should be made available. See same comment for sections E.3.b.(3)(c) & (d)	Revise Provision E.3.c.(3)(b)(ii) as follows: "The Copermittee may ~~allow~~ exempt redevelopment Priority Development Projects ~~to comply with~~ from the hydromodification management BMP performance requirements of Provision E.3.c.(2) where the project is designed and constructed to be certified under the USGCB LEED for New Construction and Major Renovations green building certification program, or other locally accepted certification of equivalent effectiveness."
E.3.c.(3)(b)(iii)	82	Alternative	Minor clarification.	Revise Provision E.3.c.(3)(b)(iii) as follows:

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Compliance Project Options		"The Copermittee may allow Priority Development Projects greater than 100 acres in total project size (or smaller than 100 acres in size yet part of a larger common plan of development that is over 100 acres) to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2)~~.~~ under ~~The Priority Development Project must comply with~~ the following conditions: _"
E.3.c.(3)(b)(iv) [b]	83	Alternative Compliance Project Options	Without this change, this language would dictate that the alternative flow control be downstream of the PDP, when the downstream area may not benefit from any HMP control. By locating areas within the watershed that are in need of hydromodification mitigation, alternative compliance can be directed to areas that will have the greatest benefit for the watershed as a whole. This is in agreement with recommendations made in the SCCWRP technical report 667 which concludes that "hydromodification management should be considered in the context of an overall watershed-scale strategy that targets maintenance and restoration of critical processes in the critical locations in the watershed."	Revise Provision E.3.c.(3)(b)(iv)[b] as follows: "The Copermittee may allow Priority Development Projects to utilize offsite regional BMPs to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) if the offsite regional BMPs ~~have the capacity to manage the storm water flows rates and durations from the site such that the receiving waters are protected from the potential for increased erosion that would be caused if the unmanaged portion of the runoff was discharged from the site~~ <u>will have a greater overall receiving water benefit within the Watershed Management Area than implementation of the hydromodification controls onsite</u>."
E.3.c.(3)(b)(vi)	84	Alternative Compliance Project Options	Minor clarification.	Revise Provision E.3.c.(3)(b)(vi) as follows: "The channel, stream, or habitat rehabilitation project cannot be utilized for pollutant treatment ~~except~~ <u>unless constructed with an artificial wetland.</u> ~~where artificial wetlands are constructed and located upstream of receiving waters."~~
E.3.c.(3)(c)	854	Alternative Compliance In-Lieu Fee Option	Add "or" to indicate that operation and maintenance may be a separate option as indicated in E.3.c.(3)(c)(iii).	Revise Provision E.3.c.(3)(c) as follows: "The Copermittee may develop and implement an alternative compliance in-lieu fee option, individually or with other Copermittees and/or entities, as a means for designing, developing, constructing, operating and<u>/or</u> maintaining offsite alternative compliance projects under Provision E.3.c.(3)(b). Priority Development Projects allowed to utilize the alternative compliance in-lieu fee

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				option must comply with the following conditions:"
E.3.c.(3)(c)(i)	84	Alternative Compliance In-Lieu Fee Option	Minor clarification.	Revise Provision E.3.c.(3)(c)(i) as follows: "The in-lieu fee must be transferred to the Copermittee (for public projects) or an escrow account (for private projects) prior to the construction initiation date ~~constructed~~ of the Priority Development Project ~~is initiated~~."
E.3.c.(3)(c)(ii)	84	Alternative Compliance In-Lieu Fee Option	Include "operation and maintenance" since it is included in E.3.c.(3)(c)(ii)[d].	Revise Provision E.3.c.(3)(c)(ii) as follows: "If the in-lieu fee is applied to the development, design, ~~and~~ construction, operation and maintenance of offsite alternative compliance projects, the following conditions must be met:"
E.3.c.(3)(c)(ii) [b]	85	Alternative Compliance In-Lieu Fee Option	Multiple PDPs joining into an alternative compliance regional BMP will require a longer timeline in order to generate enough funding to begin the planning, design, permitting, and construction of the regional BMP. In addition, multiple permits will likely be necessary from multiple government agencies (party agreements, jurisdictional agreements, Army Corp of Engineers, 401, 404, maintenance agreements, etc), thus slowing the timeline of completion of the alternative compliance project. If the alternative compliance project must be completed within the first 4 years of the first project to fund, then the complexity or size of the project will be limited and may serve as a deterrent to the use of the alternative compliance option.	Revise Provision E.3.c.(3)(c)(ii)[b] as follows: "The offsite alternative compliance projects must be constructed as soon as possible, but no later than 8 4 years after the certificate of occupancy is granted for the first Priority Development Project that contributed funds toward the construction of the offsite alternative compliance projects, unless a longer period of time is authorized by the San Diego Water Board Executive Officer."
E.3.c.(3)(c)(ii) [c]	85	Alternative Compliance In-Lieu Fee Option	Delete redundant and ambiguous language	Delete Provision E.3.c.(3)(c)(ii)[c]. ~~The in-lieu fee for the Priority Development Project must include mitigation of the pollutant loads and increased storm water flow rates and durations that are allowed to discharge from the site before the offsite alternative compliance projects are constructed; and~~
E.3.c.(3)(c)(ii) [d]	85	Alternative Compliance In-Lieu Fee Option	A reasonable timeframe must be established to base the fee upon, however that time frame must be relevant to the type of project being constructed and its anticipated	Revise Provision E.3.c.(3)(c)(ii)[d] as follows: The in-lieu fee must ~~also~~ include the cost to operate and maintain the offsite alternative compliance projects for the

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			lifespan.	anticipated life of the constructed priority development project.
E.3.c.(3)(c)(iii)	85	Alternative Compliance In-Lieu Fee Option	Minor clarification.	Revise Provision E.3.c.(3)(c)(iii) as follows: If the in-lieu fee ~~is applied~~ applies only to the operation and maintenance of offsite alternative compliance projects that have already been constructed, the offsite alternative compliance projects must allow the Priority Development Project to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2).
E.3.c.(5)(a)(vi)	86	Infiltration and Groundwater Protection	Treatment for infiltration BMPs should only be required if significant pollutant levels are present.	Revise Provision E.3.c.(5)(a)(vi) as follows: "Infiltration BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless runoff does not exceed Basin Plan water quality standards or runoff is first treated or filtered to remove pollutants prior to infiltration; and"
E.3.e(1)(c)	88	Structural BMP Approval and Verification Process	When easements and agreements are publicly recorded, information is conveyed during the sale of the property. Therefore this sentence is not necessary.	Revise Provision E.3.e.(1)(c) as follows: Each Copermittee must require and confirm that appropriate easements and ownerships are properly recorded in public records~~. And the information is conveyed to all appropriate parties when there is a change in project or site ownership.~~
E.3.e.(2)(a)	89	Priority Development Project Inventory and Prioritization	Copermittees update databases on a regular basis to input new projects, track inventory, import/export data for daily activities, and pull data on an annual basis for reporting.	Revise Provision E.3.e.(2)(a) as follows: Each Copermittee must develop, maintain, and update ~~at least annually~~ regularly, a watershed-based database to track and inventory all Priority Development Projects and associated structural BMPs within its jurisdiction. Inventories must be accurate and complete beginning from January 2002 for the San Diego County Copermittees, February 2003 for the Orange County Copermittees, and July 2005 for the Riverside County Copermittees, where data is available.
E.3.e.(2)(a)(vi)	89	Priority Development Project Inventory	In some cases, corrective actions or resolutions are not needed if no violations were found. Therefore they would only be entered into the database "when applicable".	Revise Provision E.3.e.(2)(a)(vi) as follows: Corrective actions and/or resolutions when applicable.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		and Prioritization		
E.4	90	Construction Management	The language has been updated so that the Copermittee can define which construction projects will be inventoried within its jurisdictional program. Not all jurisdictions apply permits the same way, therefore each needs the ability to address their processes in regards to construction projects. This will eliminate projects in the inventory that are issued local building or construction permits but have no ground disturbance, e.g. plumbing, electrical, mechanical, decks, patios, etc.	Add the following after the first paragraph of Provision E.4.: a. "Construction Program Management Each copermittee must define in the Jurisdictional Runoff Management Plan the following: (1) Define construction sites to be inventoried, such as sites that involve any ground disturbance or soil disturbing activities. (2) Define a process for confirming adequate construction BMP implementation for non-inventoried sites. Non-inventoried sites involve minor construction activities that are not anticipated to create storm water pollution such as interior improvements, plumbing, electrical and mechanical work. "
E.4.a.(4)	91	Project Approval Process	Language is redundant and unnecessary because applicable permits are included as an attachment of the project's SWPPP as required under the Construction General Permit.	Revise Provision E.4.a.(4) as follows: Delete language as shown: "Verify that the project applicant has obtained coverage under ~~applicable permits, including, but not limited to~~ the Construction General Permit. ~~, Clean Water Act Section 401 Water Quality Certification and Section 404 Permit, and California Department of Fish and Game Streambed Alteration Agreement.~~"
E.4.b.(1)(d)	91	Construction Site Inventory and Tracking	The anticipated completion date is often unknown and can fluctuate based on unpredictable and unforeseen circumstances. Keeping track of accurate dates in an inventory would be difficult and would not add significant value to the database. Construction Inspectors keep a close eye on the progress of projects and would not need to rely on inventory data to achieve effective stormwater management and oversight. Once a project is completed, the date can be entered into the database.	Revise Provision E.4.b.(1)(d) as follows: "The project start and ~~anticipated completion~~ completed dates;"
E.4.d.(1)(a)	93	Inspection	Minor clarification.	Revise Provision E.4.d.(1)(a) as follows:

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Frequency		Each Copermittee must conduct inspections at all inventoried sites, including high threat to water quality sites, at an appropriate frequency for each phase of construction to ~~ensure~~ confirm the site reduces the discharge of pollutants in storm water from construction sites to the MEP, and prevents non-storm water discharges from entering the MS4.
E.4.d.(3)(c)	94	Inspection Tracking and Records	Considerable staff resources would be spent on calculating the amount of rainfall since last inspection and this information is not useful. This information would be really subjective if there is no nearby rain gauge. Instead, the current weather conditions observed during the inspection is more useful and easy data to capture.	Revise Provision E.4.d.(3)(c) as follows: ~~Approximate amount of rainfall since last inspection;~~ Weather condition during inspection;
E.5.a	95	Existing Development Inventory and Tracking	Adding the term "reasonable potential to discharge", consistent with the Clean Water Act, allows flexibility for the Copermittees to determine priorities. The term "may discharge" is too broad and will limit Copermittees ability to focus on jurisdictional and watershed priorities. The focus needs to be on significant pollutant load discharges so inspections and enforcement can actually succeed in receiving water pollutant load reductions versus spending an exhaustive amount of time and money inspecting sites that discharge no pollutant loads, but "may" discharge pollutant loads, even though unlikely to do so.	Revise Provision E.5.a. as follows: "Each Copermittee must maintain an annually updated watershed-based inventory of all the existing development that has the reasonable potential to ~~may~~ discharge a pollutant load to and from the MS4".
E.5.a.(1)(d)(vii) E.5.a.(2)(f)	96 96	Existing Development Inventory and Tracking	Mobile home parks are outside the jurisdiction of the Copermittees. They are regulated by the state.	Revise Provision E.5.a.(1)(d)(vii) as follows: ~~"Mobile home park"~~ Revise Provision E.5.a.(2)(f) as follows: "(f) ~~Identification if an area is a~~ Common Interest Areas (CIAs) / Home Owner Associations (HOAs)~~, or~~ and ~~mobile home parks~~; "
E.5.b	97	Existing Development BMP Implementation and Maintenance	See comment E.5.a.	Revise Provision E.5.b. as follows: "Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development with the reasonable potential to discharge pollutant loads

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				to their MS4, including special event venues."
E.5.b.(1)(a)	97	Existing Development BMP Implementation and Maintenance	Required use of pollution prevention methods will be extremely difficult to enforce. Pollution prevention is proven to be more effective through public behavioral changes via public outreach and education.	Revise Provision E.5.b.(1)(a) as follows: "Each Copermittee must ~~require~~ promote the use of pollution prevention methods by the commercial, industrial, and municipal facilities and areas in its inventoried existing development through public outreach."
E.5.c	99	Existing Development Inspections	See comment E.5.a.	Revise Provision E.5.c. as follows: "Each Copermittee must conduct inspections of inventoried existing development that have been identified by the Copermittee as having the reasonable potential to discharge pollutant loads from their MS4 to ensure compliance with applicable local ordinances and permits, and the requirements of this Order."
E.5.c.(1)(a)(i)	99	Inspection Frequency	See comment E.5.a. The schedule for inspections should be limited to the permit term because the permit cannot require or enforce schedules beyond the term of the permit.	Revise Provision E.5.C.(1)(a)(i). as follows: "At a minimum, inventoried existing development that has been identified by the Copermittee as having the reasonable potential to discharge pollutant loads to and from their MS4 must be inspected once ~~every five years~~ during the permit term."
E.5.c.(1)(a)(v)	99	Inspection Frequency	Volunteer and patrol programs fall under the category of valid public complaints and should be clairified as such in the fact sheet. Volunteer and patrol programs may not have enforcement authority, requiring follow-up by the Copermittees. This Provision should be limited to Copermittees municipal and contract staff with some level of enforcement authority.	Revise Provision E.5.c.(1)(a)(v) as follows: "Inventoried existing development must be inspected by the Copermittee, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff ~~or volunteer monitoring or patrol program~~ inspections."
E.5.c.(2)(a)(i) through (iii)	100	Inspection Content	The addition of "if present" is necessary for clarification. Otherwise, it implies that an inspection must take place to observe an actual discharge which is an unpredictable event (would require inspector to be present for a long period of time waiting for such an event to take place).	Revise Provision E.5.c.(2)(a)(i) through (iii) as follows: "(i) Visual inspections of actual non-storm water discharges, if present; (ii)Visual inspections of actual or potential discharge of pollutants, if present; (iii)Visual inspections of actual or potential illicit connections, if present; and…"

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
E.5.d	101	Existing Development Enforcement	Limiting language should be included for the Copermittee's jurisdiction. The existing development inventory and enforcement should be limited to development with the reasonable potential to discharge pollutants.	Revise Provision E.5.d.as follows: "Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development <u>identified by the Copermittee as having the reasonable potential to discharge pollutant loads from the MS4 within their jurisdiction</u>, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6."
E.5.e	101	Strategies to Address the Highest Priority Water Quality Conditions	Resource re-allocation will assist in neutralizing costs for any channel rehabilitation/retrofit projects undertaken by the Copermittees and will have a more significant likelihood of improving water quality than monitoring.	Add: the following text to Provision E.5.e.: "<u>(4) Upon Regional Board approval and in lieu of monitoring during any given year, the Copermittees may reallocate resources originally authorized for water quality monitoring for retrofit and/or rehabilitation project(s) if those projects occur at a location where monitoring is conducted, for a maximum of two nonconsecutive years during the Permit term."</u>
E.6.b.(5)	104	Enforcement Response Approaches and Options	Criminal penalties should be limited to intentional or criminally negligent acts.	Revise Provision E.6.b.(5)(e) as follows: (5) Administrative and criminal <u>(if intentional or criminally negligent)</u> penalties; (a)
E.6.e.(1)	105	Reporting of Non-Compliant Sites	San Diego Water Board notice should be consistent with 40 CFR §122.41(l)(6) and the State of California Construction General Permit. The requirements should be 24 hour verbal notice and five day written notification	Revise Provision E.6.e.(1) as follows: "Each Copermittee must notify the San Diego Water Board in writing within ~~2 working days~~ <u>5 calendar days</u> of issuing <u>escalated</u> enforcement…"
E.7	106	Public Education and Participation		"…discharge of pollutants <u>from the MS4</u> ~~in storm water~~ to the MEP"
E.7.a.(1)	106	Public Education	There is specific emphasis on pesticides, herbicides and fertilizers. The rationale for the specificity of these topics is unclear. Given the emphasis on showing changes in water quality, education efforts should be focused on activities that address the pollutants of concern and behaviors that are tied to water quality issues. Therefore, each Copermittee, by jurisdiction and watershed, should identify, determine and prioritize the activities that address priorities consistent with Provision B.	Revise Provision E.7.e.(1) as follows: "Educational activities, public information activities, and other appropriate outreach activities intended to reduce pollutants ~~associated with the application of pesticides, herbicides and fertilizer in storm water discharges~~ <u>of concern</u> from the MS4 to the MEP<u>. Activities shall be determined and prioritized by Copermittees by jurisdiction and/or watershed (Provision B) to address the highest threats to water quality (such as pesticides, herbicides and</u>

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				fertilizers, used oil, toxic waste, etc. and to facilitate the proper management and disposal of used oil and toxic waste, etc.)…"
E.7.a.(2)	106	Public Education	There is specific emphasis on used oil and toxic material disposal. The rationale for the specificity in education topics is unclear. As stated above, Copermittees should be able to target education efforts on the pollutants and behaviors most commonly linked to the water quality issues within their respective jurisdictions and watersheds. Thus, this Provision is incorporated in the changes proposed above and would become part of E.7.a.1.	Move Provision E.7.a(2) into E.7.a(1).
F. Reporting				
F.1	109-110	Water Quality Improvement Plans	Based on the mock WQIP development process completed by stakeholders in recent months, the Copermittees have developed an alternative submittal schedule for the WQIPs. The alternative submittal schedule would provide additional information on potential BMP strategies with the first submittal (Priority Conditions and Potential Strategies), but allow for more time to develop numeric goals, detailed JRMP commitments, and Reasonable Assurance Analysis with the second submittal (Numerical Goals and Water Quality Improvement Strategies and Schedules) and approval from elected officials for final submittal (Water Quality Improvement Plan submittal). The revised timeline better reflects the schedule needed by Copermittees to develop robust WQIPs, but also provides additional information early in the process for stakeholder review. These requested changes are outlined in the comments below.	See the changed in the attached revised Permit to section F.1, as described in the comments below.
F.1.a.(1)	109	Priority Water Quality Conditions	The stakeholders' mock WQIP process has highlighted elements of the WQIP development process that could be	Revise Provision F.1.a.(1) as follows:

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			revised to better reflect the Copermittees' internal processes. For the early submittal, it is preferred to submit Priority Water Quality Conditions and Potential Strategies. Selection of specific strategies will be important, but an initial step is proposed at the 6-month mark to establish a level of understanding regarding the "menu" of options including terminology, BMP types, etc. The effort to develop numeric goals, however, will require more analyses, considering the array of pollutants and beneficial uses that will need to be considered. As such, it is requested that numeric goals be moved to the second WQIP submittal (as opposed to the first submittal). Finally, with the first submittal is when a Copermittee should express its intent to pursue an iterative, WQIP-based compliance mechanism using a Water Quality Improvement Plan with Reasonable Assurance Analysis, per our comments on Provision B.3.a.	(1) Priority Water Quality Conditions and Potential Strategies ~~Numeric Goals~~ (a) The Copermittees must implement a public participation process to solicit data and information to be utilized in the development and identification of the priority water quality conditions for the Watershed Management Area. (b) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the development of the priority water quality conditions and ~~numeric goals~~ potential strategies to be included in the Water Quality Improvement Plan. (c) Within 6 months after the commencement of coverage under this Order, the Copermittees must develop and submit the Water Quality Improvement Plan requirements of Provision B.2.a-d and a list of potential strategies that will be considered for the draft Water Quality Improvement Plan to the San Diego Water Board. Each Copermittee selecting the option to develop a Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism per Provision B.3.a.(3) must also indicate their intent to pursue the option in the submittal. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 60 days. (d) The Copermittees must consider revisions to ~~revise~~ the priority water quality

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				conditions ~~and~~ ~~numeric goals~~ based on public comments received and must respond to ~~and/or~~ recommendations or direction from the San Diego Water Board Executive Officer.
F.1	109 and 110	Water Quality Improvement Plans	The public comment process for the WQIP submittals will be open to a wide array of stakeholders and the Regional Board staff. There is potential that some comments may conflict with one another, and may conflict with comments provided by the Regional Board EO. The language in the Permit suggests that each comment requires a revision. Each comment should be considered, but some comments may not result in a revision. The Copermittees agree, however, that all comments from the Regional Board Executive Officer must be responded to.	Revise Provisions F.1.a.(1).(d), F.1.a.(2).(c), and F.1.b.(3) as follows: "The Copermittees must consider revisions to ~~revise~~ the priority water quality conditions ~~and~~ ~~numeric goals~~ based on public comments received and must respond to ~~and/or~~ recommendations or direction from the San Diego Water Board Executive Officer."
F.1.a.(2)	109	Water Quality Improvement Strategies and Schedules	Modifications to the second WQIP submittals are proposed, based on the stakeholders' mock WQIP development process. The commitments to implement strategies/BMPs associated with JRMPs were highlighted as a major challenge of the second WQIP submittal. The 9-month timeline does not allow sufficient time to develop JRMP commitments, particularly if an optional Reasonable Assurance Analysis will be developed. A 16-month timeline is needed for Copermittees to engage elected officials/management on the draft WQIP numeric goals and resulting WQIP commitments (strategies, activities, etc.) to meet those goals. Furthermore, as mentioned above, it is requested that numeric goals be submitted with the second WQIP submittal (as opposed to the first submittal).	Revise Provision F.1.a.(2) as follows: (2) Numeric Goals and Water Quality Improvement Strategies and Schedules (a) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the development of the numeric goals and water quality improvement strategies and schedules to be included in the Water Quality Improvement Plan. (b) Within ~~9~~ 16 months after the commencement of coverage under this Order, the Copermittees must develop and submit the Water Quality Improvement Plan requirements of Provisions B.2.e and B.3 to the San Diego Water Board. Each Copermittee selecting the option to develop a Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism per Provision B.3.a.(3) must also submit a draft Reasonable Assurance Analysis. The San Diego Water Board will issue a public notice and solicit public

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				comments on the Water Quality Improvement Plan for a minimum of 60 days. (c) The Copermittees must consider revisions to ~~revise~~ the numeric goals and water quality improvement strategies and schedules based on public comments received ~~and/or~~ and must respond to recommendations or direction from the San Diego Water Board Executive Officer.
F.1.b.(1)	110	Water Quality Improvement Plan Submittal	Based on the comment above, and to allow Copermittees at least two months to respond to comments received during the 60-day comment period on the draft WQIP and provide four months for elected officials to approve the final WQIPs and incorporated commitments (strategies, activities, etc.), a total of 24 months are requested for final WQIP submittal. In this manner, the timeline from draft WQIP development to Regional Board submittal would proceed as follows: O 16 months: Draft WQIP O 18 months: comment period ends O 20 months: revise WQIPs O 24 months: Copermittee approval of WQIPs and submit to RB The 24-month timeline is considered reasonable, as it comprises the first two years of the Permit cycle, while the remaining three years can be focused on WQIP implementation. Also, Clarify that the Santa Margarita River Water Quality Improvement Plan is not due until 18 months after the Riverside County Copermittees are covered under this order.	Revise Provision F.1.b.(1) as follows: (1) Within ~~18~~ 24 months after the commencement of coverage under this Order, the Copermittees for each Watershed Management Area must submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B to the San Diego Water Board. Each Copermittee selecting the option to develop a Water Quality Improvement Plan to serve as an iterative, implementation-based compliance mechanism per Provision B.3.a.(3) must also submit a final Reasonable Assurance Analysis. The Santa Margarita River Watershed Management Area must submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B to the San Diego Water Board 18 months after the Riverside Copermittees are covered under this Order. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 30 days.
F.1.b	109	Water Quality Improvement Plan	For WQIP implementation to be feasible, Copermittees must have at least one full fiscal year budgeting cycle within	Add Provision F.1.b.(5) as follows:

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Submittal	which to seek additional funding to implement the WQIP from our governing bodies (i.e., City councils and County supervisors).	(5) Copermittees must commence with implementation of the Water Quality Improvement Plan no later than the fiscal year (July 1) following San Diego Water Board approval of the Water Quality Improvement Plan.
F.3.b.(1)	112	Annual Reports	The Annual Report for monitoring and assessment programs typically requires seven months to prepare. Lead time is needed to plan and secure the resources and contracting mechanisms to conduct monitoring programs. Therefore, If the Order is adopted on March 1, 2013, then the Water Quality Improvement Plan would be submitted to the SDRWQCB by September 2014. The Water Quality Improvement Plan could be accepted by SDRWQCB as early as 60 days after submittal (November 2014). This would then require the first Annual Monitoring and Assessment Report to be due on January 30, 2015. This report would only include one year of transitional monitoring instead of two. To rectify this, modify the reporting deadline such that it is the following January 31st of the conclusion of the monitoring season of September 30th.	Revise Provision F.3.b.1 as follows: "(1) The Copermittees for each Watershed Management Area must submit an Annual Report for each reporting period no later than January 31 of the following year. The annual reporting period consists of two periods: 1) July 1 to June 30 of the following year for the jurisdictional runoff management programs, 2) October 1 to September 30 of the following year for the monitoring and assessment programs. The first Annual Report must be prepared for the reporting period beginning July 1 after commencement of coverage under this Order, and upon San Diego Water Board determination that the Water Quality Improvement Plan meets the requirements of this Order to June 30 in the following year for the jurisdictional runoff management programs.~~,~~The first Annual Report must be prepared for the reporting period beginning 50 days after adoption of this Order and the January 31st following the first September 30th (conclusion of monitoring season) after the San Diego Water Board determines that the Water Quality Improvement Plan meets the requirements of this Order ~~September 30 in the following year~~ for the monitoring and assessment programs. Annual Reports must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Each Annual Report must include the following:"
F.3.b.(3)	113	Annual Reports	Originators of data are legally responsible for their data and should enter the data into CEDEN. It is not always possible for Copermittees to verify the veracity or quality of third party data. The quality control data requirements of CEDEN do not easily allow third parties to successfully enter data	Revise Provision F.3.b.3.e as follows: "(3) Each Copermittee must provide any data or documentation utilized in developing the Annual Report upon request by the San Diego Water Board. ~~Any~~ Copermittee monitoring data utilized in developing the

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			without the associated detailed laboratory QA/QC data, detailed knowledge of the field protocols employed, and the ability to verify SWAMP comparability. There are also often difficulties associated with the practical aspects of data formatting to meet the requirements of the CEDEN data checker; these issues could be very difficult or impossible to resolve with third party data. The draft requirement would likely discourage Copermittees from seeking out third party data sets, as Copermittees would be in violation of the Permit if data could not readily be uploaded to CEDEN.	Annual Report must be uploaded to the California Environmental Data Exchange Network (CEDEN).[32] Any Copermittee monitoring and assessment data utilized in developing the Annual Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4."
F.3.c	114	Regional Monitoring and Assessment Report	This report appears to be duplicative with the Integrated Assessment of Water Quality Improvement Plan (Provision D.4.d) that is also due with the Report of Waste Discharge. Please clarify the intent of these reports and if the same modify accordingly.	Delete Provision F.3.c. ~~a. REGIONAL MONITORING AND ASSESSMENT REPORT~~ ~~(1) The Copermittees must submit a Regional Monitoring and Assessment Report no later than 180 days in advance of the expiration date of this Order. The Regional Monitoring and Assessment Report may be submitted as part of the Report of Waste Discharge required pursuant to Provision F.5.b. The Copermittees must review the receiving water and MS4 outfall discharge monitoring data collected pursuant to Provisions D.1 and D.2, and findings from the assessments required pursuant to Provision D.4, to assess the following:~~ ~~(a) The beneficial uses of the receiving waters within the San Diego Region that are protected or must be restored;~~ ~~(b) The progress toward restoring impacted beneficial uses in the receiving waters within the San Diego Region; and~~ ~~(c) Pollutants or conditions of emerging concern that may impact beneficial uses in the receiving waters within the San Diego Region.~~ (2) ~~The Regional Monitoring and Assessment Report must include recommendations for improving the implementation and assessment of the Water Quality Improvement Plans and jurisdictional runoff~~

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				~~management programs.~~ (3) ~~Each Copermittee must provide any data or documentation utilized in developing the Regional Monitoring and Assessment Report upon request by the San Diego Water Board. Any monitoring and assessment data utilized in developing the Regional Monitoring and Assessment Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.~~
F.3.c.(3)	114	Regional Monitoring and Assessment Report	[*Applies if provision not stricken per prior comment:*] Originators of data are legally responsible for their data and should enter the data into CEDEN. It is not always possible for Copermittees to verify the veracity or quality of third party data. The quality control data requirements of CEDEN do not easily allow third parties to successfully enter data without the associated detailed laboratory QA/QC data, detailed knowledge of the field protocols employed, and the ability to verify SWAMP comparability. There are also often difficulties associated with the practical aspects of data formatting to meet the requirements of the CEDEN data checker; these issues could be very difficult or impossible to resolve with third party data. The draft requirement would likely discourage Copermittees from seeking out third party data sets, as Copermittees would be in violation of the Permit if data could not readily be uploaded to CEDEN.	If Provision F.3.c.(3) is not removed, revise Provision F.3.c.(3) as follows: "(3) Each Copermittee must provide any data or documentation utilized in developing the Regional Monitoring and Assessment Report upon request by the San Diego Water Board. Any monitoring and assessment data <u>collected by Copermittees</u> ~~utilized~~ in developing the Regional Monitoring and Assessment Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4."
F.4	115	Regional Clearinghouse	The Copermittees require language clarification that the regional clearinghouse may be maintained by another agency.	Add the following footnote to the first paragraph of Provision F.4: "<u>The Copermittee may elect to develop and maintain the clearinghouse(s) provided by other Copermittees or agencies.</u>"
F.5	116-117	Report of Waste Discharge	See comment F.4.	Add similar language from F.4 to a footnote.
G. Principal Watershed Copermittee Responsibilities				
G	118	Principal Watershed	Coordinating and developing, with the other Copermittees, the requirements of Provisions F.3.c, F.4, and F.5.b of this	Remove requirement that Principal Copermittee can only be Principal Copermittee for 2 watersheds and clarify that

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Copermittee Responsibilities	Order.	all Copermittees have some level of commitment, not just the Principal Watershed Copermittee.
H. Modification of Programs				
H	119	Modification of Programs	Modifications of programs are allowed under the Water Quality Improvement Plan as part of the iterative process and adaptive management. Language should be added to that effect or there may be annual amendments to the Order.	Revise Provision H.3. as follows: "Proposed modifications <u>outside of the Water Quality Improvement Plan process</u> that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures."
H	119	Modification of Programs	The reopener for the Project I Beaches and Creeks Bacteria TMDL is scheduled to fall within the term of this Permit (April 2016). This TMDL is a major component of TMDL requirements incorporated into this Permit, and should be acknowledged in Provision H. Other TMDLs may be reopened during this Permit as well. The Regional Board should express a good faith effort to revise this Order based on the revised TMDL requirements.	Add Provision H.5, as follows: <u>5. The San Diego Water Board may re-open and modify this order at any time prior to its expiration, after opportunity for public comment and a public hearing, if the Basin Plan Amendments for any of the TMDLs in Attachment E are revised by the San Diego Regional Board. Should a TMDL Basin Plan Amendment be revised and adopted by the Regional Board, then the Regional Board will re-open this Order as soon as possible to update the TMDL requirements in Attachment E to reflect the revised Basin Plan Amendment.</u>
I. Standard Permit Provisions and General Provisions				
			N/A	None.
Attachment A. Discharge Prohibitions				
			N/A	None.
Attachment B. Standard Permit Provisions and General Provisions				
Attachment B	B1-B5	Standard Permit Provisions and General Provisions	This attachment incorporates the standard NPDES permit provisions as identified in 40 CFR 122.41. Although correctly transposed from the regulations the provisions are obviously developed for a traditional point source permit (i.e. wastewater permit). As such there are a number of standard provision that pose challenges to the Copermittees to comply with. Clarification is requested on a number of the provisions.	See specific changes noted below.
Attachment B;	B-7	Bypass	This provision requires the Copermittees to notify the	Delete this provision.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
1.m			Regional Board whenever an anticipated or unanticipated bypass will occur. Given the nature of storm events and the fact that stormwater treatment BMPs include bypass provisions to protect the BMP integrity it would appear that the Copermittees would have to notify the Regional Board anytime a storm is predicted to ensure compliance with the provision. This provision was crafted for typical wastewater discharges and has little relevance to stormwater.	
Attachment B, 2.h	B-12	NPDES Permitted Non-Storm Water Discharges		Add the following text at the end of the Provision: "<u>A Copermittee will not be held responsible for pollutants in its MS4 discharge originating from an NPDES-permitted non-storm water discharge.</u>
Attachment B, 2.i.2	B-12	Monitoring	The timeline for retention of records is in conflict with similar retention provisions under Att B.1.j.(2)	Align requirements or delete either Provision.
Attachment C. Acronyms, Abbreviations and Definitions				
Attachment C	C-2	Definitions – Automotive Repair Shop	This is no change to the definition in E.3.b, but relocates the definition to Appendix C for consistency with the rest of the document. The square footage threshold is retained in Provision E.3.b because this is a regulatory specific rather than a definition.	Add the following definition: <u>Automotive Repair Shop – a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539 or equivalent NAICS code.</u>
Attachment C	C-2	Definitions – Best Management Practices	Include in the definition that BMPs may be used in place of numeric effluent limits.	Reinstate the previous definition as follows: "<u>In the case of municipal discharge permits, BMPs may be used in the place of numeric effluent limits.</u>
Attachment C	C-3	Definitions – Channel Rehabilitation and Improvement	The term channel rehabilitation and Improvement is used in the permit but is not adequately defined. Adding a definition with clarify which projects that would fit under this category.	Add the following definition: <u>Channel Rehabilitation and Improvement – Remedial measures or activities for the purpose of improving or restoring the environmental health of streams, channels or river streams. Techniques may vary from in-stream restoration techniques to off-line stormwater management practices installed in the system corridor or upland areas. Rehabilitation techniques may include, but are not limited</u>

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				to the following: riparian zone restoration, constructed wetlands, bank stabilization, channel modifications, and daylighting of drainage systems. Effectiveness may be measured in various manners, including: assessments of habitat, reduced streambank erosion, and restoration of water and sediment transport balance.
Attachment C	C-3	Definitions – Construction Site	Update the definition for Construction site to define the area to be disturbed and narrow definition to work outside of a facility.	Revise the definition of Construction Site as follows: "…soil disturbing activities greater than 10,000 square feet…excavation. This does not include interior construction activities such as interior remodeling, plumbing, electrical, or mechanical work."
Attachment C	C-3	Definitions - Copermittee	Add clarification that the San Diego Region is Region 9.	Add: "..Region (Region 9) …"
Attachment C	C-3	Definitions - Development Project	More concise and specifies development projects that have land disturbance, in line with Grading Ordinance definitions.	Edit the following definition as follows: **Development Projects** - Construction, rehabilitation, redevelopment, or reconstruction of any public or private ~~residential~~ projects involving land disturbance activities ~~industrial, commercial, or any other projects~~.
Attachment C	C-4	Definitions – Direct Discharge to an Environmentally Sensitive Area	The "Environmentally Sensitive Area" definition found elsewhere in Appendix C would remain unchanged. This new definition would support interpretation of the Priority Development Project category titled "Environmentally Sensitive Areas" (E.3.b(d)) and remove much current confusion that applicants and reviewers have in interpreting these rules. In discussions with Regional Board staff we have learned specifically what their concern is regarding a direct hydraulic connection between the development project and the specially protected areas. We feel that this language adequately addresses that concern while providing the most succinct language that can be interpreted reasonably well for a wide range of development scenarios.	Add the following definition: Direct Discharge to an Environmentally Sensitive Area – Flow that is conveyed overland a distance of 200 ft or less from the development to the ESA, or conveyed in a pipe any amount of distance as an isolated flow from the development to the ESA (i.e. not commingled with flows from adjacent lands).
Attachment C	C-4	Definitions – Household		Revise the text as follows: "… other hazardous wastes"

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
		Hazardous Waste		
Attachment C	C-5	Definitions - Inland Surface Waters	Change the definition to include waters of the U.S. not State.	Replace the definition as follows: "**Inland Surface Waters –** Includes all surface waters of the U.S. that do not include the ocean, enclosed bays, or estuaries."
Attachment C	C-5	Definitions – Low Impact Development Best Management Practices	Minor grammatical correction.	Revise the definition as follows: "that emphasize conservation ~~s~~and the use of on-site natural features"
Attachment C	C-6	Definitions - Major Outfall	Minor grammatical correction	"…with a drainage area of more…"
Attachment C	C-6	Definitions – Maximum Extent Practicable (MEP)		Revise the text as follows: "The technology-based standard established by Congress in CWA Provision 402(p)(3)(B)(iii) for ~~storm water~~ discharges of pollutants that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve, typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense)."
Attachment C	C-7	Definitions – MS4	The addition of CWA language to the definition of MS4 limits Copermittees' responsibilities to within their jurisdiction and strengthens support that Copermittees are not responsible for discharges in MS4s that they do not operate.	Revise text as follows: "… Which is not part of the Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.~~26~~22. Copermittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators." 40 CFR §122.21(a)(vi).
Attachment C	C-7	Definitions – Non-Storm Water		Revise text as follows: All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). Non-storm water includes illicit

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				discharges<ins>,</ins> ~~and~~ NPDES permitted discharges, <ins>and the discharges described in Provision E(2)(a)(3)-(5).</ins>
Attachment C	C-8	Definitions - Outfall	Add the definition of outfall and cite the Federal Regulations.	Add the following definition: <ins>**Outfall** - *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States. 40 C.F.R. 122.26(b)(9).</ins>
Attachment C	C-8	Definitions – Parking Lot	This is no change to the definition in E.3.b, but relocates the definition to Appendix C for consistency with the rest of the document. The square footage threshold is retained in Provision E.3.b because this is a regulatory specific rather than a definition.	Add the following definition: <ins>Parking Lot – a land area or facility for the tempraory parking or storage of motor vehicles used personally, for business, or for commerce.</ins>
Attachment C	C-8	Definitions – Pre-Development Runoff Conditions	The definition for Pre-Development Runoff Conditions should be the exact language EPA used in the Federal Register at 64 FR §68761. We acknowledge the removal of language referencing natural watershed hydrology before human induced alterations. Jurisdictions cannot require project applicants to match post-project hydrograph to the pre-development hydrograph because it may impose mitigation beyond the project's impacts. The pre-project standard provides the appropriate nexus to the project impacts, as is the standard followed by CEQA.	Revise the definition as follows: ~~Pre-Development~~ Pre-Project Runoff Conditions – "Runoff conditions that exist~~ed~~ onsite <ins>immediately</ins> before the ~~existing development was constructed, or exists onsite before~~ planned development activities occur. <ins>Pre-development is not intended to be interpreted as that period before any human-induced land disturbance has occurred. 64 FR 68761</ins>."
Attachment C	C-8	Definitions – Properly Designed	A definition of "Properly Designed," which mentioned in Source Control BMP Requirements is not mentioned in the definitions Provision of Attachment C. As currently written, the permit authorizes subjective broad authority and deference to the Regional Board in interpretation of the definitions, if not included. This term requires a definition.	Add the following definition: "<ins>**Properly Designed –** Designed in accordance with the Copermittee's BMP Design Manual and/or any appropriate design requirements set forth by the Copermittee and based on widely accepted design criteria</ins>."

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
Attachment C	C-8	Definitions – Public Education, Outreach, and Participation	Neither Public Education and Outreach, nor Public Participation are mentioned in the definitions Provision of Attachment C. Please add definitions for these non-structural BMPs.	Add the following definition: "<u>Public Education, Outreach and Participation – Programs to educate residents, businesses and visitors about the importance of water quality and water quality programs so that they will support local efforts and understand their role in protecting receiving waters. The Education and Outreach Program will increase knowledge and awareness, improve attitudes toward storm pollution prevention, and provide a foundation for changing behaviors that contribute to storm water pollution.</u>"
Attachment C	C-8 through C-9	Definitions - Redevelopment	The current San Diego permit R9-2007-0001 Definition for Redevelopment states "Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing and reconfiguring surface parking lots and existing roadways." Resurfacing and reconfiguration of parking lots should still be included in this sentence as these actions are not increasing impervious surfaces and are necessary for ongoing maintenance (pothole repair, root intrusion, damage repair, etc).	Revise the following definition: Redevelopment – "The creation, addition, and/or replacement of impervious surface on an already developed site <u>through construction or alteration of the existing footprint</u>" …Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing existing roadways; <u>resurfacing, cutting and reconfiguring of surface parking lots</u>; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair."
Attachment C	C-9	Definitions - Restaurant	This is no change to the definition in E.3.b, but relocates the definition to Appendix C for consistency with the rest of the document. The square footage threshold is retained in Provision E.3.b because this is a regulatory specific rather than a definition.	Add the following definition: <u>Restaurant – a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812).</u>
Attachment C	C-9	Definitions – Retail gasoline outlet	No prior definition existed, so one was created for consistency with the other priority development project categories. The square footage threshold is retained in Provision E.3.b because this is a regulatory specific rather than a definition.	Add the following definition: <u>Retail gasoline outlet (RGO) – a business that sells automotive or truck fuel to the general public.</u>
Attachment C	C-9	Definitions - Retrofitting	Minor edit to improve understanding of when retrofitting is appropriate.	Revise the following definition:

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				"**Retrofitting** – Storm water management practice put into place after development has occurred in watersheds where the practices previously did not exist <u>or are ineffective</u>…"
Attachment C	C-10	Definitions – Street, Road, Highway, Freeway, and Driveway	This is no change to the definition in E.3.b, but relocates the definition to Appendix C for consistency with the rest of the document. The square footage threshold is retained in Provision E.3.b because this is a regulatory specific rather than a definition.	Add the following definition: <u>Street, Road, Highway, Freeway and Driveway – "Any paved impervious surface that is used for the transportation of automobiles, trucks, motorcycles, and other vehicles."</u>
Attachment C	C-10	Definitions – Waters of the state	This language should be limited based on the intent of the definition (natural water sources) and should not be interpreted to include man-made structures that collect runoff for the sole purpose of flow volume/velocity and/or pollutant reduction, such as a wet pond. Circumstance and condition should be considered as part of determination whether a water body is a water of the state.	"**Waters of the State** - Any water, surface or underground, including saline waters within the boundaries of the State [CWC Provision 13050 (e)]. The definition of the Waters of the State is broader than that for the Waters of the United States in that all water in the State is considered to be a Waters of the State ~~regardless of circumstance or condition~~."
Attachment D. Jurisdictional Runoff Management Program Annual Report Form				
			N/A	None.
Attachment E. Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2013-0001				
Attachment E. (General)	E-1 through E-47	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2013-0001	The organization of the TMDL provisions could be improved to help more clearly outline the interim and final requirements and schedules. The Copermittees recommend a reformat that would be easier to follow and has a clearer connection between receiving water limitations, effluent limitations, BMP requirements, and compliance determination.	As shown in the attached revised Permit, revise the organizational structure of the TMDL Specific Provisions, using the following outline: (a) Applicability (b) Final TMDL Compliance Requirements (c) Interim TMDL Compliance Requirements (d) Monitoring and Assessment
Attachment E. (General)	E-1 through E-47	Compliance Determination sub-sections for each TMDL	As discussed in comments under Provision B, the Copermittees have fully embraced using WQIPs as an integral component of our programs, and would like to extend the role of WQIPs into TMDL compliance determination.	Incorporate a WQIP-based compliance option (BMP-based WQBELs) into the Compliance Determination sections of Attachment E (consistent with the comment on the revisions to Provision B.3.a) , with the WQIPs serving as the compliance mechanism.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			There is regulatory precedent for including WQIP-based compliance mechanisms ("BMP-based WQBELs") as a TMDL compliance option. State and federal law do not require the use of numeric effluent limitations for MS4 Copermittees, but rather encourage flexible implementation of best management practices through an iterative process. Specifically, the choice to include either management practices or numeric limitations in MS4 permits is within the regulatory agency's discretion, and on the question of whether MS4 permits must contain numeric effluent limitations, the court upheld EPA's use of iterative BMPs in place of numeric effluent limitations for storm water discharges. (See Defenders of Wildlife v. Browner, 191 F.3d 1159, 1166-1167 (9th Cir. 1999)[6] The findings of California's Stormwater Blue Ribbon Panel, which was convened specifically to examine the feasibility of incorporating numeric effluent limits in stormwater permits, ultimately concluded that numeric limits were generally infeasible across all three stormwater activities (municipal, industrial, and construction), with a few exceptions (*The Feasibility of Numeric Effluent Limits Applicable to Discharges of Stormwater Associated with Municipal, Industrial and Construction Activities, June 19, 2006*). Additionally, state law and policy does not require the use of numeric effluent limitations in MS4 permits. In 2009, the State Water Board affirmed this approach in a precedential order, stating: "[it] is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California's NPDES storm water permits. This is not to say that a wasteload allocation will result in	As shown in the attached revised Permit, the following sub-bullet would be incorporated into the interim and final Compliance Determination sections for each TMDL: "The Responsible Copermittee has submitted and is fully implementing a Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision x.x.(x).x."

[6] See also California Regional Water Quality Control Board San Diego Region - Fact Sheet / Technical Report For Order No. R9-2010-0016 / NPDES NO. CAS0108766.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			numeric effluent limitations for municipal storm water dischargers. Whether a future municipal storm water permit requirement appropriately implements a storm water wasteload allocation will need to be decided on the regional water quality control board's findings *supporting either the numeric or non-numeric* effluent limitations contained in the permit." (Order WQ 2009-0008, In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District, at p. 10 (emphasis added).) Furthermore, a memo issued in 2010 by EPA directors Hanlon and Keehner describes how permitting agencies have discretion to use BMP-based WQBELs for MS4 Permits: "The permitting authority's decision as to how to express the WQBELs(s), either as numeric effluent limitations or BMPs, including BMPs accompanied by numeric benchmarks, should be based on an analysis of the specific facts and circumstances surrounding the permit, and/or the underlying WLA, including the nature of the stormwater discharge, available data, modeling results or other relevant information." In a July 23, 2012 comment letter from EPA to the Los Angeles Regional Board on the recent LA County MS4 Permit regarding that Board's use of this approach,, EPA stated: "This is consistent with EPA guidance in its updated memorandum of November 10, 2010 concerning the incorporation of WLAs into stormwater permits, available at: http://www.epa.gov/npdes/pubs/establishingtmdlwla revision.pdf. This memorandum recommends the use of numeric effluent limits when feasible, and notes that BMP-	

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			based approaches are appropriate in cases where the administrative record for the permit quantitatively demonstrates the BMPs required by the permit will be sufficient to ensure compliance with the WLAs. This has also been a long-standing EPA policy dating back to EPA's previous 2002 guidance memorandum concerning the incorporation of WLAs into stormwater permits, available at: http://www.epa.gov/npdes/pubs/final-wwtmdl.pdf." The WQIPs could 1) demonstrate that BMP-based approaches are appropriate and 2) provide the necessary information so that the administrative record for the permit can demonstrate the BMPs required by the permit will be sufficient to ensure compliance with the WLAs.	
Attachment E. (General)	E-1 through E-47	Best Management Practice sub-sections for each TMDL	The "Best Management Practices" subsections for each TMDL should incorporate the WQIP-based compliance concept as proposed in the proposed revisions to Provision B.3, and describe the steps that Copermittees must take for WQIPs and BMP-based WQBELs to be approved by the Regional Board as a compliance mechanism. It is important to note that this approach would be subject to public review and Regional Board approval, and thus this approach has many "checkpoints" where the Regional Board is able to determine whether WQIP-based compliance (BMP-based WQBELs) is appropriate given the approach and level of rigor in the WQIP. Furthermore, the WQIPs would provide sufficient detail regarding the strategies and activities to be implemented, which would allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner.	As shown in the attached revised Permit, insert a new Best Management Practices sub-bullet in the interim and final TMDL Compliance Requirements sections for each TMDL as follows: (a) For Copermittees utilizing the WQIP-based compliance option, the strategies and activities contained in the WQIP accepted by the San Diego Water Board and adaptively managed as outlined in Provision B.6, F.1, and F.2, will serve as BMP-based WQBELs under the following conditions, as outlined in Provision B.3.a: (1) A Responsible Copermittee requests that the Water Quality Improvement Plan be approved as the basis for compliance with the discharge prohibitions (A.1), receiving water limitations (A.2), and/or effluent limitations (A.3) in the letter of submittal to the San Diego Water

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
				Board; (2) Reasonable assurance is demonstrated that the strategies and activities in the Water Quality Improvement Plan are expected to attain the final receiving water limitations or final WQBELs under Specific Provision xx.y; (3) The submitted schedule as outlined in Provision B.3 provides sufficient detail regarding the strategies and activities to be implemented to allow the Regional Board to use the schedule for compliance determination in a clear, specific, measurable, and enforceable manner; AND (4) The WQIP is approved by the Regional Board Executive Officer and is implemented per the approved schedule and adapted pursuant to Provisions B.6, F.1, and F.2.
Attachment E. (General)	E-1 through E-47	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2013-0001	The Receiving Water Limitations associated with TMDLs should not be referred to as Water Quality Based Effluent Limitations (WQBELs). The Copermittees are only responsible for their discharges to receiving waters not for concentrations in receiving waters. Receiving water quality can be affected by multiple sources, including agriculture and other sources that are permitted by this Board. A WQBEL is a restriction on the quantity or concentration of a pollutant that may be *discharged from a point source* into a receiving water that is necessary to achieve an applicable water quality standard in the receiving water (See 40 CFR § 122.2; NPDES Permit Writer's Manual, Appendix A. Categorizing the Receiving Water Limitations as WQBELs is inconsistent with federal regulations and standard permitting practices and could subject the Copermittees to	As shown in the attached revised Permit, for each TMDL, clearly separate receiving water limitations from Water Quality Based Effluent Limitations using separate sub-section headers.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			Mandatory Minimum Penalties.	
Attachment E. (General)	E-1 through E-47	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2013-0001	The Order needs to clearly describe the linkage between receiving water limitations and effluent limitations. The effluent limitations should be used to determine whether Copermittees are causing or contributing to exceedances of receiving water limitations. They are not a standalone provision. If receiving water limitations are met, then the effluent limitations are not applicable.	For each Water Quality Based Effluent Limitations sub-section, insert language to describe how WQBELs and RWLs are linked. As shown in the attached revised Permit, the corresponding WQBEL sub-section for each TMDL should open with language similar to the following: "In the case that receiving water limitations are exceeded after the end of the compliance schedules under Specific Provision E.X.x, effluent limitations will be used to determine whether MS4 discharges are causing or contributing to exceedances of receiving water quality limitations. To demonstrate MS4 discharges are not causing or contributing to an exceedance of receiving water quality limitations, MS4 discharges must meet the concentration-based effluent limitations in Table X.X." Similarly interim and final compliance schedules should reflect this as well. As shown in the attached revised Permit, the Interim and Final Compliance Schedule sub-sections for each TMDL should include language similar to the following: "The Responsible Copermittee must be in compliance with the final receiving water limitations or final WQBELs under Specific Provision E.X."
Attachment E. (General)	E-1 through E-47	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2013-0001	Concentration-based effluent limitations should be applied on a watershed-basis, not outfall by outfall. The Copermittees should have flexibility to address the highest impact outfalls, and not be required to *address every single outfall* (e.g., there is little environmental benefit to construct	For each Water Quality Based Effluent Limitations table with concentration-based WQBELs, insert a footnote to allow Copermittees to manage stormwater quality on a watershed basis. As shown in the attached revised Permit, the footnote for

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			BMPs to control outfalls with relatively low *loadings* that do not affect receiving water conditions). If the approach is outfall-by-outfall (instead of watershed basis), then the costs of compliance will be MUCH higher as nearly every outfall will require an action/BMP regardless of whether or not the loading has an effect on the receiving water. The Copermittees can protect receiving waters by ensuring that discharge concentrations are below the effluent limitations on a *flow-weighted* basis. If one outfall is slightly higher than the WQBEL concentration, but another is below the WQBEL concentration then the MS4s have not impacted water quality as long as the flow-averaged concentration is below the effluent limitation.	each concentration-based WQBEL table would read as follows: "Concentrations shall be determined on a flow-weighted basis across all outfalls within a jurisdiction, not outfall-by-outfall."
Attachment E.1.b (Chollas Creek Diazinon TMDL)	E-3	Water Quality Based Effluent Limitations	The Chollas Creek Diazinon TMDL is based on an erroneous target. The TMDL set the numeric targets equal to the California Department of Fish and Game (CDFG) Water Quality Criteria for the protection of freshwater aquatic organisms from diazinon (Menconi and Cox 1994). The acute and chronic targets equal 0.08 ug/L and 0.05 ug/L, respectively. However, an error in a data point contained in the CDFG criteria was found. In a letter dated May 19, 2004, from Chris Ingersoll (US Geological Survey) to Lenwood Hall (University of Maryland), Mr. Ingersoll discusses an error in the 96-h LC50 of 0.2 ug/L for *Gammarus fasciatus* reported by Johnson and Finley (1980) and by Mayer and Ellersieck (1986). Mr. Ingersoll's letter notes that based on his review of the data sheets, the 96-h LC50 should have been reported as 2 ug/L and not 0.2 ug/L, which was used to calculate the criteria. In a letter dated July 30, 2004 from Brian Finlayson (CA Department of Fish and Game) to Joe Karkoski (Central Valley Regional Water Quality Control Board), Mr. Finlayson confirms that a transcription error occurred and suggests that these data	Replace the receiving water limitation with the recalculated Criterion Maximum Concentration (aka acute criterion) and the Criterion Continuous Concentration (aka chronic criterion) of 0.16 ug/L and 0.10 ug/L, respectively. Set the acute and chronic effluent limitations as 90% of the criteria (same approach as the TMDL) equal to 0.144 ug/L and 0.09 ug/L, respectively.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			cannot be used in the calculation of the criteria. Mr. Finlayson suggests the recalculated Criterion Maximum Concentration (aka acute criterion) and the Criterion Continuous Concentration (aka chronic criterion) should be 0.16 ug/L and 0.10 ug/L, respectively. Additionally, USEPA published aquatic life water quality criteria for diazinon in December 2005 (EPA-822-R-05-006), which established acute and chronic criteria equal to 0.17 ug/L. Incorporation of the Chollas Creek Diazinon TMDL into the MS4 permit based on the CDFG criteria is inappropriate given the fact these criteria are known to be faulty. The receiving water limitations and effluent limitations should either 1) be removed until the TMDL can be corrected or 2) the recalculated CDFG or USEPA criteria should be utilized. The TMDL assumed, at the time, the CDFG criteria were correct and their use in setting targets and corresponding WLAs was appropriate. However, new information is available that demonstrates those criteria are faulty. Thus, replacement of the receiving water limitations and effluent limitations, would be consistent with the assumptions of the WLAs because the WLAs were intended to implement the narrative toxicity and pesticide objectives in the Basin Plan. As stated on page 16 of the TMDL Staff Report: “By setting the numeric targets equal to the CDFG Water Quality Criteria for diazinon, the Regional Board is quantitatively interpreting the narrative water quality objective of “no toxics in toxic amounts” to mean “no diazinon concentrations in Chollas Creek in excess of 0.08 µg/L for any 1 hour period or in excess of 0.05 µg/L for any 4-day period”. The pesticide water quality objective is interpreted in the same way.”	
Attachment E.2.b	E-5	Water Quality Based Effluent	The California Toxics Rule (CTR) establishes dissolved	Add the WER term to the receiving water limitations acute

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	**Tentative Order Page**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
(Shelter Island Dissolved Copper TMDL)		Limitations	saltwater criteria that are expressed as a function of a Water-Effect Ratio (WER). The WER is set equal to 1.0 unless a site-specific study has been completed. The WER term was incorporated into the Chollas Creek Dissolved Metals TMDL.	and chronic criteria and the effluent limitations, tables 2.1 and 2.2, respectively. Add the following footnote to both tables: "The Water Effect Ratio (WER) is assumed to be 1.0 unless there is a site-specific and chemical-specific WER."
Attachment E.2 (Shelter Island Dissolved Copper TMDL)	E-6	Compliance Determination	The TMDL envisioned MS4s would implement management practices to reduce copper loadings to the Shelter Island Yacht Basin (SIYB). As stated on page 53 of the TMDL Staff Report: "The Regional Board will amend Order No. 2001-01, "Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm /Sewer Systems" to require that discharges of copper into SIYB waters not increase from existing loadings… The order could also be amended to require BMPs designed to reduce copper loading into SIYB, and/or monitoring for copper in the runoff management plan pertinent to SIYB."	Allow for BMP-based WQBELs, as envisioned when the TMDL was adopted. As shown in the attached revised Permit, a new Compliance Determination sub-bullet for each TMDL (for both final and interim WLAs) should be added as follows: "(e) The Responsible Copermittees have submitted and are fully implementing an Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision x.x.(x).x."
Attachment E.3.b (Rainbow Creek Watershed Nutrient TMDL)	E-9 of redline	Specific Provisions for Total Maximum Daily Loads Applicable to Order No. R9-2012-0011	The Rainbow Creek TMDL for Total Nitrogen and Phosphorous does not include Wasteload Allocations for the County of San Diego Copermittees. The TMDL only contains Load Allocations. Load allocations should not be implemented through an NPDES permit. It is inappropriate to simply "re-name" the Load Allocations as Wasteload Allocations.	Strike the following TMDL from Attachment E in its entirety: Total Maximum Daily Loads for Total Nitrogen and Total Phosphorus in Rainbow Creek Watershed
Attachment E.3.b (Rainbow Creek Watershed Nutrient	E-10	Water Quality Based Effluent Limitations	Notwithstanding the previous comment, the TMDL clearly states which dischargers are subject to wasteload/load reductions that must be incorporated into their respective permits. For example the TMDL Technical Report states: "nutrient wasteload reductions will eventually be incorporated into Caltrans statewide NPDES storm water	If not striken entirely, add the following compliance determination method to Specific Provisions 3 "The Responsible Copermittee is using its legal authority to reduce nutrient discharges from the land uses identified under Specific Provision 3.b.(2).(b) to the maximum extent practicable."

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	**Tentative Order Page**	**Section Title**	**Reason for Proposed Changes/Comments**	**Proposed Changes**
TMDL)			permit." Similar language cannot be found regarding incorporating nutrient wasteload and/or load reductions into the County of San Diego's NPDES permit. The only NPDES permit-related requirement imposed upon the County of San Diego is "to require increasingly stringent best management practices" for nutrient discharges to or from the MS4 within the watershed. Furthermore, the Technical Report states that "any Regional Board enforcement action taken will be against individual dischargers and not the County of San Diego."	
Attachment E.4.b (Chollas Creek Dissolved Metals TMDL)	E-12	Compliance Determination	The TMDL envisioned MS4s would implement actions to reduce metals loadings to Chollas Creek. As stated on page 4 of the BPA: "Actions to meet the WLAs in discharges to Chollas Creek will be required in WDRs that regulate MS4 discharges, industrial facility and construction activity stormwater discharges, and groundwater extraction discharges in the Chollas Creek watershed." Additionally, as stated on page 1 of the State Water Board's Resolution (No. 2008-00054) approving the BPA: "The amendment requires actions to be taken to implement management practices to ensure compliance with water quality criteria."	Allow for BMP-based WQBELs, as envisioned when the TMDL was adopted. As shown in the attached revised Permit, a new Compliance Determination sub-bullet for each TMDL (for both final and interim WLAs) should be added as follows: "(e) The Responsible Copermittees have submitted and are fully implementing an Water Quality Improvement Plan that is developed and adaptively managed as outlined in Provisions B, F.1 and F.2, is accepted by the San Diego Water Board, and meets the conditions of Specific Provision x.x.(x).x."
Attachment E.5.b (Baby Beach and Shelter Island Bacteria TMDL)	E-16	Final Water Quality Based Effluent Limitations	The WLAs from the Baby Beach and Shelter Island Bacteria TMDL include percent reductions that should be incorporated into the Order. These percent reductions would allow the Copermittees to plan and implement BMPs in a manner that best reflects the TMDL load reduction requirements. The load reduction requirements would also facilitate BMP-based compliance mechanisms and allow the WQIPs to be better integrated with TMDL requirements.	Incorporate load-based effluent limitations into the Specific Provisions for the Baby Beach and Shelter Island Bacteria TMDL. As shown in the attached revised Permit, a new Table 5.2b should be added to the Final WQBEL sub-section, including the % reductions required by the TMDL. These % reductions should be linked to the concentration-based effluent limitations with an "OR" statement.

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
			For the Baby Beach and Shelter Island Bacteria TMDL, there were certain conditions that required ZERO reduction by MS4s. The effluent limitations should reflect these TMDL expectations.	
Attachment E.6.a.(5)	E-21	Applicability	Since adoption of the Project I Bacteria TMDL, the Copermittees have submitted data analysis to the Regional Board to demonstrate that 303(d) listings for San Marcos HA, San Dieguito River HA, and Los Penasquitos HA were incorrectly applied to REC beneficial uses. The Regional Board has concurred with the findings for each HA and stated that these HAs are "not subject to further action under Resolution No. R9-2010-0001." Similar responses are expected for the other HAs.	Add the following text to Section 6.a.(5): "See table 6.0<u>; Consistent with Basin Plan Amendment (Resolution No. R9-2010-0001, p. A-2); specific beach segments from some of the Pacific Ocean shorelines listed in Table 6.0 have been delisted from the 2008 (sic 2010) 303(d) list that was approved by the San Diego Board on December 16, 2009, and therefore are not subject to the requirements of Attachment E as long as monitoring data continues to support compliance with water quality standards."</u>
Attachment E.6.b (Project I Beaches and Creeks Bacteria TMDL)	E-24	Water Quality Based Effluent Limitations	The total coliform WQO only applies ocean waters, and should not be applied to creeks. The freshwater (creek) receiving water limitations in the TMDL do <u>not</u> include total coliform.	As shown in the attached revised Permit, apply the footnote 4 to total coliform receiving water limitations and WQBELs and specify the following: "Total coliform limitations apply only to segments of areas of Pacific Ocean Shoreline listed in Table 6.0."
Attachment E.6.b (Project I Beaches and Creeks Bacteria TMDL)	E-24 through E-25	Water Quality Based Effluent Limitations	The WLAs from the Project I Bacteria TMDL include allowable loadings and percent reductions that should be incorporated into the Order. These percent reductions would allow the Copermittees to plan and implement BMPs in a manner that best reflects the TMDL load reduction requirements. The load reduction requirements would also facilitate BMP-based compliance mechanisms and allow the WQIPs to be better integrated with TMDL requirements.	Incorporate load-based effluent limitations into the Specific Provisions for Project I Bacteria TMDL. As shown in the attached revised Permit, a new Table 6.2b should be added to the Final WQBEL sub-section, specifying the % reductions required by the TMDL. These % reductions should be linked to the concentration-based effluent limitations with an "OR" statement.
Attachment E.6.c	E-30	Compliance Schedule	Similarly, the interim effluent limitations should reflect the % reductions required by the TMDL. The TMDL requires a	Incorporate load-based, interim effluent limitations into the

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
(Project I Beaches and Creeks Bacteria TMDL)			50% reduction, so the % reductions applied to the final effluent limitations should be divided by two and included as interim WQBELs.	Specific Provisions for Project I Bacteria TMDL. As shown in the attached revised Permit, a new Table 6.5 should be added to the Interim WQBEL sub-section, specifying the % reductions required by the TMDL. These % reductions, which are 50% of the reductions required for final WQBELs, should be linked to the interim concentration-based effluent limitations with an "OR" statement.
Attachment E.6.b (Project I Beaches and Creeks Bacteria TMDL)	E-30	Interim Compliance Dates	The CLRPs to be submitted by Copermitees propose interim compliance dates, as allowed by the Project I Bacteria TMDL, to meet the 50% reduction milestone for dry and wet weather. The CLRPs submitted by Copermittees may not all propose the same interim compliance dates and the Permit should acknowledge the flexibility allowed by the TMDL (see page 68 of Attachment A of the Basin Plan Amendment) to revise the interim compliance dates via the CLRPs. In fact, this scheduling flexibility was a primary "incentive" for Copermitees to develop CLRPs instead of BLRPs.	Revise the Order to reflect the flexibility allowed by the TMDL. As shown in the attached revised Permit, add language to the interim compliance dates section to allow interim compliance date flexibility, as follows: "…unless alternative interim compliance dates are provided in a Comprehensive Load Reduction Plan or Water Quality Improvement Plan accepted by the San Diego Regional Board Executive Officer."
Attachment E.6.b (Project I Beaches and Creeks Bacteria TMDL)	E-31 and 32 of redline	Final Receiving Water Limitations and Final WQBELs	The Basin Plan Amendment for the Project I Bacteria TMDL contains Receiving Water Limitations. These Receiving Water Limitations should be incorporated directly into the Permit. However, Attachment E contains Receiving Water Limitations that do not match those from the TMDL. The Regional Board should not revise or translate the RWLs from the TMDL, they should be incorporated directly. The RWLs incorporated into Attachment E have several discrepancies with the RWLs in the TMDL, including application of single sample targets to the dry weather RWLs and application of total coliform RWLs for inland waters.	Replace entirely the RWLs in the Permit with those from the TMDL, which separates RWLs into RWLs for beaches (Table 6.1) and RWLs for Creeks (Table 6.2). The TMDL RWLs should be *pasted directly* from the Basin Plan Amendment (Attachment A, page 52).

SAN DIEGO COPERMITTEE COMMENTS ON TENTATIVE ORDER NO. R9-2013-0001				
Permit Section	Tentative Order Page	Section Title	Reason for Proposed Changes/Comments	Proposed Changes
Attachment E 6.d.1.b.ii and 6.d.2.b.ii, footnotes 36 and 3837 respectively (Project I Beaches and Creeks Bacteria TMDL)	E-33	Specific Monitoring and Assessment Requirements	To be consistent with Attachment A of Resolution No. R902010-0001,Section (7) (i) 2. Monitoring for TMDL Compliance and Compliance Assessment (p. A54), allow additional wet weather samples collected to be applied to the wet weather period as indicated in the following: "If only one sample is collected for a storm event, the bacteria density for every wet weather day associated with that storm event shall be equal to the results from that one sample. If more than one sample is collected for a storm event, but not on a daily basis, the bacteria density for all the wet weather days not sampled shall be equal to the highest bacteria density result reported from samples collected. The exceedance frequency shall be calculated by dividing the number of wet weather days that exceed the single sample maximum REC-1 WQOs by the total number of wet weather days during the rainy season."	Revise text as follows: Wet weather days are defined by the TMDL as storm events of 0.2 inches or greater and the following 72 hours. The Responsible Copermittees may choose to limit their wet weather sampling requirements to storm events of 0.2 inches or greater, or also include storm events of 0.1 inches or greater as defined by the federal regulations [40CFR122.26(d)(2)(iii)(A)(2)]. <ins>If only one sample is collected for a storm event, the bacteria density for every wet weather day associated with that storm event shall be equal to the results from that one sample. If more than one sample is collected for a storm event, but not on a daily basis, the bacteria density for all the wet weather days not sampled shall be equal to the highest bacteria density result reported from samples collected. The exceedance frequency shall be calculated by dividing the number of wet weather days that exceed the single sample maximum REC-1 WQOs by the total number of wet weather days during the rainy season.</ins>

RE: Comments on Tentative Order Number: R9-2013-0001

Dear Mr. Chiu:

San Elijo Lagoon Conservancy respectfully submits the following comments on the draft San Diego Regional Municipal Separate Storm Sewer System permit.

Urban runoff is the San Diego region's most urgent pollution problem. Arguably, it is the most difficult to solve. In a region known for its beaches and strong tourism economy, polluted runoff makes our beaches and waterways unsafe for swimming, fishing and other recreation for at least 72 hours after a rain event. Even in dry weather, our "urban drool" from residents and businesses overwatering lawns becomes a major pollution source.

The good news is by working together as a community, we can solve this challenging public health problem. The Water Quality Improvement Plans proposed in the draft permit have the potential to become powerful tools to help us improve water quality within our watersheds. However, the Copermittees cannot be tasked with creating these plans alone. Specifically:

- The Permit should require formation of a stakeholder advisory group for each watershed that includes representatives of environmental groups with knowledge of the watershed.
- This stakeholder advisory group should work closely with the Copermittees and a regional board staff member while the Water Quality Improvement Plans are being developed to ensure these plans aggressively pursue water quality gains.
- The stakeholder advisory process should include accountability and measureable milestones to ensure the goals of the Permit are being met.

By taking advantage of the knowledge and resources of diverse stakeholders like municipalities, businesses and residents, our region can be on the cutting-edge of addressing urban runoff and creating healthier communities and watersheds. But this can only be achieved if these diverse voices are impacting the planning process in a meaningful way.

San Elijo Lagoon Conservancy recognizes the challenge urban runoff presents to our region, and we want to do our part to solve the problem. San Elijo Lagoon Conservancy is interested in participating in a Water Quality Improvement Plan development process for Escondido Creek watershed and the Carlsbad Hydraulic Unit.

San Elijo Lagoon Conservancy urges the Regional Board to enhance the stakeholder participation opportunities during Water Quality Improvement Plan development and then approve the permit.

Respectfully submitted,

Doug Gibson

Re: Comment—Tentative Order No. R9-2013-001, Regional MS4 Permit, Place ID: 786088Wchiu

Dear Mr. Chiu:

I am writing in regards to the San Diego Regional Water Quality Control Board's Tentative Order R9-2012-0011 ("Permit") dated October 31, 2012. After reviewing the proposed Permit, I am concerned it will impose expensive, onerous, and untested regulations on local governments, businesses, and residents. These new regulations will impact the region's economy without improving its water quality.

Everyone understands the importance of clean, safe water to the region. It is important, however, that we use our limited resources wisely, and ensure that our efforts produce the desired outcome of improving water quality. I applaud the Board's inclusion of Water Quality Improvement Plans (WQIP) as a first step in developing a cost-effective approach to improving our water. Analysis remains a critical component of a successful strategy, and I am glad to see that the Board is committed to finding the best possible solution to water quality improvement.

I am concerned, however, that the costs associated with enforcing and implementing the permit will have a negative impact on my business and San Diego's economy. The four primary areas of concern include: 1) the strict liability for exceeding water quality objectives; 2) the additional and changing requirements for development projects, impacting items such as storm water retention and discharge; 3) the preemption of WQIPs by new and changing regulatory requirements prior to allowing the WQIPs to be developed and implemented; and 4) the lack of reliable funding sources to implement these regulatory changes.

It is necessary to hold individuals, businesses and governments accountable, but it is critical that the accountability measures can be reasonably achieved and are likely to have a significant and positive impact on San Diego's water. Because of these concerns, I respectfully request that the Permit focus on the timely development of effective and enforceable WQIPs, and that each of the WQIPs be developed through a process that ensures public participation. I ask also that the designation of appropriate Best Management Practices in each watershed be determined through the WQIP process rather than the one size fits all strategy currently being proposed in the Permit. I ask further that until the Board adopts a WQIP for a watershed that the provisions of the existing Permit remain in place for that watershed. Finally, in order to avoid unnecessary litigation I request that the Board adopt the WQIPs as Orders implementing the proposed Permit.

I urge you to adopt final permit language that is evidence-based and both environmentally and economically sustainable. Thank you for your consideration.
Sincerely,

Carol T. Crossman

RE: Comment -Tentative Order No. R9-2013-0001
Regional MS4 Permit, Place ID: 786088Wchiu

Dear Wayne,

The Priority Development "cutoff" levels don't appear to have a link to soil types, which greatly impact the amount of runoff. A site with Type A soil ("Site A") retains a large portion of rainwater naturally, and has a small amount of runoff. Adding 5,000 square feet (SF) of impervious surface to "Site A" massively increases the amount of runoff compared to the natural condition because the water that previously soaked into the ground now runs off. Compare this to a site of equal size and slope but with Type D soil ("Site D"). In its natural condition very little water is retained by soaking into the ground due to the tight soil matrix and rock. Adding 5,000 square feet of impervious surface to "Site D" only slightly increases runoff from the site, since the site was nearly impervious in its natural condition. The permit should reflect this basic hydrologic tenant, and have stepped cutoff, such as: 5,000 SF for A soils, 6,000 SF for B, 7,000 for C, and 9,000 SF for D. This would more accurately reflect the increase in runoff from sites with differing soils.

Suggested language:

II.E.b.(2)(a)
New development projects that create ~~10,000 square feet or~~ more ~~of~~ impervious surfaces (collectively over the entire project site) based on the following soil types:

Type A soil = 10,000 square feet or more
Type B soil = 12,000 square feet or more
Type C soil = 14,000 square feet or more
Type D soil = 16,000 square feet or more

This category includes commercial, industrial, residential, mixed-use, and public development projects on public or private land which fall under the planning and building authority of the Copermittee.

II.E.b.(2)(g)
Streets, roads, highways, freeways, and driveways. This category is defined as any paved impervious surface ~~that is 5,000 square feet or more~~ used for the transportation of automobiles, trucks, motorcycles, and other vehicles that meet the following criteria:

Type A soil = 5,000 square feet or more
Type B soil = 6,000 square feet or more
Type C soil = 7,000 square feet or more
Type D soil = 9,000 square feet or more

Compliance

Develop language to clearly link WQIPs to Permit compliance.

TMDLs

Add options for BMP - and load-based compliance with WLAs. Insert language in *Modification of Programs* (Provision H) to reopen Permit to incorporate TMDL revisions and CLRP modifications.

Hydromodification Management Plan

Reaffirm Resolution R9-2010-0066; reference the Resolution in the permit.
Replace "pre-development naturally occurring" with "pre-project".

Should you have questions, you may contact me via email at sstrapac@poway.org or by phone at (858) 668-4653.

Sincerely,

NPDES PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4) DRAINING THE WATERSHEDS WITHIN THE SAN DIEGO REGION (REGIONAL MS4 PERMIT) (ORDER NO. R9-2013-0001)

Dear Mr. Chiu:

The County of San Diego, Department of Environmental Health (DEH) has reviewed the proposed draft Order No. R9-2013-001 (Regional MS4 Permit), and offers the following comments:

The existing San Diego MS4 Storm Water permit includes vector-related language which is intended to raise awareness of the potential unintended public health risk resulting from mosquito production in certain storm water management devices, the proposed draft permit does not. The removal of the vector-related language raises a significant concern, and we request that it be placed back into the proposed draft to protect public health. Please note that the San Diego Regional MS4 permit was the first in the United States to include vector-related language, and ultimately resulted in improved language adopted into storm water permits throughout the State.

The vector-related language included in the existing MS4 permit represents a compromise that allows water quality goals to be met while minimizing the risk to public health. It recognizes that mosquitoes cannot completely be eliminated given the current water quality requirements. It further serves a critical public health purpose of maintaining an awareness of the potential unintended public health threat created by mosquitoes, and emphasizes the importance of proper maintenance of storm water management and treatment structures to minimize the potential for mosquito production and ultimately the spread of mosquito-borne diseases including West Nile Virus (WNV).

WNV continues to be a threat to human health, and has proven to be unpredictable. 2012 was the second worst year for WNV in the United States and California since it was introduced 13 years ago. Approximately 5,400 human illnesses were confirmed nationwide, with 243 deaths as of December 12, 2012. In California there were 464 confirmed cases in 2012 with 18 deaths as of December 24, 2012.

It is critical that the State and the RWQCB continue to include vector-related language in storm water NPDES permits to protect public health. It would be counterproductive and counterintuitive to strive to improve the quality of water for the benefit of public and environmental health only to create environments highly conducive to mosquitoes that have the potential to severely impact human and animal health from mosquito-borne diseases.

The County of San Diego's DEH respectfully requests that the Board restore the vector-related language in the proposed draft MS4 Permit. The following is the existing permit language from Section D - Urban Runoff Management Systems, Subsection 2 - Development Planning:

> f. *If not properly designed or maintained, certain BMPs implemented or required by municipalities for urban runoff management may create a habitat for vectors (e.g. mosquitoes and rodents). However, proper BMP design and maintenance can prevent the creation of vector habitat. Nuisances and public health impacts resulting from vector breeding can be prevented with close collaboration and cooperative effort between municipalities and local vector control agencies and the State Department of Health Services during the development and implementation of urban runoff management programs.*

In addition, the County of San Diego's DEH requests that to facilitate inspection of new BMPs, the San Diego Regional Permit require that a list of new storm water management and treatment units be submitted by the Permittees to their respective vector control agencies. The County requests that the Permit include the following language recently added to the draft Fact Sheet for the Los Angeles MS4 permit:

> *Monitoring studies conducted by the California Department of Public Health (CDPH) have documented that mosquitoes opportunistically breed in structural storm water Best Management Practices (BMPs), particularly those that hold standing water for over 96 hours. Certain Low Impact Development (LID) site design measures that hold standing water such as rainwater capture systems may similarly produce mosquitoes. BMPs and LID design features should incorporate design, construction, and maintenance principles to promote drainage within 96 hours to minimize standing water available to mosquitoes. This Order requires regulated MS4 Permittees to coordinate with other agencies necessary to successfully implement the provisions of this Order. These agencies may include CDPH and local mosquito and vector control agencies on vector-related issues surrounding implementation of post-construction BMPs.*

Thank you for the opportunity to submit comments on the proposed draft language for the MS4 Permit. If you have questions regarding the above comments, please contact Rebecca Lafreniere, Chief, at (858) 694-3595 or by E-mail at Rebecca.Lafreniere@sdcounty.ca.gov.

Sincerely,

JACK MILLER, Director

9174 Sky Park Court, Suite 100
San Diego, CA 92123-4353

Subject: Comment – Tentative Order No. R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu

Dear Mr. Chiu:

The Riverside County Transportation Department (Transportation Department) appreciates the opportunity to comment on Tentative Order No. R9-2013-0001, NPDES No. CAS0109266, National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds within the San Diego Region (Tentative Order). The Transportation Department requests that the Tentative Order be revised to provide that public works transportation improvement projects are exempt from individual project-specific Standard Stormwater Mitigation Plans (SSMPs) when they are designed and constructed to the Maximum Extent Practicable (MEP) in conformance with the USEPA guidance "Managing Wet Weather with Green Infrastructure: Green Streets."[1]

Background

The Public Works departments of municipalities have an obligation to the traveling public to provide safe, efficient, and reliable street and road systems for travel. Municipalities are not profit driven, but, as public servants, strive to maintain and improve as many roads as possible within each fiscal year budget and within a reasonable (but uncertain) capital improvement program planning horizon. The Riverside County Transportation Department takes advantage of state and federal safety grants as often as we can; however such grants often come with funding limits, matching requirements, and time constraints for project completion.

Public Works transportation projects are different from conventional private development projects

[1] USEPA. 2008. http://water.epa.gov/infrastructure/greeninfrastructure/upload/gi_munichandbook_green_streets.pdf and http://water.epa.gov/infrastructure/greeninfrastructure/gi_policy.cfm#municipalhandbook

4080 Lemon Street, 8th Floor · Riverside, CA 92501 · (951) 955-6740
P.O. Box 1090 · Riverside, CA 92502-1090 · FAX (951) 955-3198

due to the following:

- State and federal funding for Public Works transportation projects have strict timelines.
- Most Public Works transportation projects (1) are constrained by private property and utility easements on either side of the road right-of-way; (2) are linear in nature, and (3) have great difficulty meeting each and every requirement associated with a project-specific SSMP given right-of-way constraints.
- The number of roadway projects delivered to the public is based on annual transportation fund allocations.
- The purpose of the majority of Public Works transportation projects is to improve public safety. Safety projects include intersection improvements, minor shoulder widening, curve realignments, adjustments to vertical grades, and turn pockets.

On July 2, 2012 Riverside County submitted to the Executive Officer of the San Diego Regional Water Quality Control Board the Transportation Project Guidance that was developed in accordance with Order No. R9-2010-0016, NPDES No. CAS0108766, Waste Discharge Requirements for Discharges from the Municipal Separate Storm Sewer Systems (MS4s) Draining the County of Riverside, the Incorporated Cities of Riverside County, and the Riverside County Flood Control and Water Conservation District within the San Diego Region (2010 Riverside County MS4 Permit). The Transportation Project Guidance was prepared in accordance with Directive F.1.d.(2)(g) of the 2010 Riverside County MS4 Permit, which stated:

> *"...To the extent that the Copermittees develop revised standard roadway design and post-construction BMP guidance that comply with the provisions of Section F.1 of the Order, then public works projects that implement the revised standard roadway sections do not have to develop a project specific SSMP. The standard roadway design and post-construction BMP guidance must be submitted with the Copermittee's updated SSMP."*

The Transportation Project Guidance addresses improvements to streets, roads, highways, and freeways, and Class I Bikeway and sidewalk projects undertaken by the MS4 Copermittees and incorporates the principles contained in the USEPA guidance, "Managing Wet Weather with Green Infrastructure: Green Streets" and addresses Hydrologic Conditions of Concern criteria. The Transportation Project Guidance was also submitted to the Santa Ana Regional Water Quality Control Board and was approved by its Executive Officer on October 22, 2012. To date, the Riverside County NPDES MS4 Copermittees have received no comments or questions from staff of the San Diego Regional Water Quality Control Board relative to the Transportation Project Guidance submitted on July 2, 2012.

Transportation Department Project Example

Recently the Riverside County Transportation Department completed the construction of a roundabout on Rancho California Road in the Temecula area. The purpose of the project was to improve an existing intersection deficiency. Several thousand cars travel Rancho California Road each day for touring the many wineries in the Temecula area. Rancho California Road has multiple intersections with several in need of traffic control measures to slow the traffic through the area. The needed traffic control measures would improve safety and provide an opportunity for residents, tourists, and commercial vehicles to cross Rancho California Road or to merge into traffic on the road. A traffic signal light would have been the appropriate solution in a more urban setting. However, in this relatively rural environment, a roundabout was determined to be a more appropriate traffic control measure. This project was built at a cost of $1.6 million with $800,000 (half the total project cost) needed to purchase land and to construct a water quality basin to treat 100% of the runoff from the project site. We believe that a regional approach to water quality would have been much more appropriate, not only due to cost, but also because of the aesthetic sensitivity of the surrounding community. Although the water quality basin performs its function and meets the requirements of a project-specific Standard Stormwater Mitigation Plan (SSMP), it does not aesthetically complement the surrounding environment. This project area consists of rolling hills, a vast landscape of vineyards, beautiful wineries, and now, a nicely landscaped roundabout with an adjacent and unattractive water quality basin. In addition to the less than optimal (aesthetically) water quality basin, the cost of the project meant that other roundabouts planned for Rancho California Road had to be deferred.

Support for Transportation Department's Request

Providing the NPDES MS4 Copermittees the alternative of using the Transportation Project Guidance would provide the most efficient use of limited public resources by:

- Ensuring that *all new roadway projects* would incorporate hydromodification Best Management Practices (BMPs) as described in the Tentative Draft Regional MS4 Permit.
- Ensuring *all roadway improvement projects* would incorporate hydromodification BMPs to the Maximum Extent Practicable (MEP) through the use of templates included in the Transportation Project Guidance
- Allowing time sensitive projects to proceed without delay.
- Ensuring that projects do not get "shelved" due to costly project-specific SSMPs for individual projects.
- Reducing the need to condemn property for the purpose of acquiring enough right-of-way to meet the requirements of SSMPs for individual projects.

The Santa Ana River Region and the Santa Margarita River Region NPDES MS4 Permittees have dedicated substantial time and resources to developing Transportation Project Guidance intended to provide a consistent structure and decision-making procedures during the planning and design of their transportation improvement projects. These NPDES MS4 Permittees are just beginning to implement the Transportation Project Guidance in which they invested to comply with their 2010 NPDES MS4 permits. The planning horizon for most transportation improvement projects is years. The NPDES MS4 Permittees should now be afforded the opportunity to implement the Transportation Project Guidance

The recently adopted 2012 NPDES MS4 Permit for the Coastal Watersheds of Los Angeles County requires street and road construction of 10,000 square feet or more of impervious surface area to (1) follow the USEPA guidance regarding "Managing Wet Weather with Green Infrastructure: Green Streets" to the maximum extent practicable and (2) to address hydromodification control measures. However, projects that are replacement, maintenance or repair of a Permittee's existing flood control facility, storm drain, or transportation network may be exempted from the hydromodification control measures. Further, the Coastal Los Angeles NPDES MS4 permit does not impose post-construction (permanent) BMPs on routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety, including impervious surface replacement or repaving, such as the reconstruction of parking lots and roadways which does not disturb additional area and maintains the original grade and alignment.

Request for Revision of Tentative Order

We urge you to reconsider the requirements imposed upon Public Works transportation projects as included in the Tentative Order No. R9-2013-0001. We request that you direct staff include the following exemption language into Provision E.3.(b)(3):

(b) Any impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles that is designed and constructed to the Maximum Extent Practicable in accordance with the USEPA guidance "Managing Wet Weather with Green Infrastructure: Green Streets"[2]. ~~Retrofitting of existing paved alleys, streets or roads that meet the following criteria:~~

~~(i) Must be two lanes or less; AND~~

~~(ii) Must be a retrofitting project implemented as part of an alternative compliance project option under Provision E.3.c.(3)(b)(v) to achieve the performance requirements of Provisions E.3.c.(1) and/or E.3.c.(2) for a Priority Development Project; AND~~

[2] USEPA. 2008. http://water.epa.gov/infrastructure/greeninfrastructure/upload/gi_munichandbook_green_streets.pdf and http://water.epa.gov/infrastructure/greeninfrastructure/gi_policy.cfm#municipalhandbook

~~(iii) Designed and constructed in accordance with the USEPA Green Streets guidance.~~

Conclusion

The Transportation Department appreciates the opportunity to comment on the Tentative Order and your consideration of our comments. The Transportation Department looks forward to participating in the further development of the next version of the Tentative Order in a collaborative process aimed at addressing the issues raised in this letter. If you have any questions regarding our comments, please contact Claudia Steiding at 951.955.1694.

Sincerely,

Patricia Romo

San Diego, CA 92123-4340

Re: Comment—Tentative Order No. R9-2013-001, Regional MS4 Permit, Place ID: 786088Wchiu

Dear Mr. Chiu:

I am writing in regards to the San Diego Regional Water Quality Control Board's Tentative Order R9-2012-0011 ("Permit") dated October 31, 2012. After reviewing the proposed Permit, I am concerned it will impose expensive, onerous, and untested regulations on local governments, businesses, and residents. These new regulations will impact the region's economy without improving its water quality.

Everyone understands the importance of clean, safe water to the region. It is important, however, that we use our limited resources wisely, and ensure that our efforts produce the desired outcome of improving water quality. I applaud the Board's inclusion of Water Quality Improvement Plans (WQIP) as a first step in developing a cost-effective approach to improving our water. Analysis remains a critical component of a successful strategy, and I am glad to see that the Board is committed to finding the best possible solution to water quality improvement.

I am concerned, however, that the costs associated with enforcing and implementing the permit will have a negative impact on my business and San Diego's economy. The four primary areas of concern include: 1) the strict liability for exceeding water quality objectives; 2) the additional and changing requirements for development projects, impacting items such as storm water retention and discharge; 3) the preemption of WQIPs by new and changing regulatory requirements prior to allowing the WQIPs to be developed and implemented; and 4) the lack of reliable funding sources to implement these regulatory changes.

It is necessary to hold individuals, businesses and governments accountable, but it is critical that the accountability measures can be reasonably achieved and are likely to have a significant and positive impact on San Diego's water. Because of these concerns, I respectfully request that the Permit focus on the timely development of effective and enforceable WQIPs, and that each of the WQIPs be developed through a process that ensures public participation. I ask also that the designation of appropriate Best Management Practices in each watershed be determined through the WQIP process rather than the one size fits all strategy currently being proposed in the Permit. I ask further that until the Board adopts a WQIP for a watershed that the provisions of the existing Permit remain in place for that watershed. Finally, in order to avoid unnecessary litigation I request that the Board adopt the WQIPs as Orders implementing the proposed Permit.

I urge you to adopt final permit language that is evidence-based and both environmentally and economically sustainable. Thank you for your consideration.

Sincerely,

Matthew C. Boomhower, RA, CSI, CCCA

San Diego, CA 92123-4340
(submitted electronically to wchiu@waterboards.ca.gov)

Subject: Comment - Tentative Order No. R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu.

Dear Mr. Chiu:

First, we would like to acknowledge the work that the Board staff has already accomplished through the focused work group efforts during the fall. Significant progress has been made on the Draft Permit from the input of co-permittees and NGO's alike since this process began in April 2012. Thank you.

That said, it was also apparent by the amount of testimony over two days at the following Board workshops that there remain significant concerns, many of which we believe can be easily be rectified to clarify and improve the Permit.

Following the Staff work sessions, we have spent a tremendous amount of additional time trying to explain our concerns at the Board workshops and work with our fellow permitees and co-permittees to develop comments and provide redline recommendations for the Permit language. Please review the comments and recommendations in writing that have been submitted on our behalf by the County of Orange, and which we support in great part.

Although it may first appear voluminous, the County of Orange redline recommendations should make for easy adjustment provided you concur with the justification and support that is presented. We have been working with these Permits now for many years and understand the importance of having carefully crafted language to allow for consistent implementation.

All of the issues that the Orange County letter raises reflect our concerns. However, we will add a few comments here on several selected issues to reinforce those comments from our own City's perspective.

For the hydromodification provision, please include the Engineered Channel Exemption (E3c2dii). While there may be a few locations upstream where reestablishment of a soft walled meandering stream may be technically & economically feasible, those locations are a small minority of the existing hard walled flood control channel system. As a suggestion to allow for that restoration possibility, you may want to reinstate the exemption, "Discharges storm water runoff into conveyance channels that are engineered for the capacity to convey the 10-year ultimate build out condition flow and are regularly maintained to ensure flow capacity all the

33282 Golden Lantern, Dana Point, CA 92629-1805 • (949) 248-3554 • FAX (949) 234-2826 • www.danapoint.org

way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean; except where the responsible flood control agency agrees with the likely feasibility of the proposed natural reestablishment and the long range goal is reflected in the approved WQIP." Although charging an in lieu fee to do other water quality improvements is a nice idea, it just won't stand up to legal challenge without a nexus. We feel it is important for the Permit to include justified requirements that are not subject to legal battles so as to not diminish the integrity of the program as a whole.

While we appreciate the intent of requiring roadwork to meet priority development standards, it must be restricted to new development (E.B.2g). In many cases, introducing water into the subgrade of street and gutter projects will be infeasible.

Our single biggest annual capital expenditure is street repair projects. The feasibility and cost to meet the draft imposed requirements could add 10% to 100% additional cost for these projects. This single requirement could exceed all the annual funding the City currently puts toward Water Quality Improvement. White it may be feasible to add these requirements to new development it is not appropriate for redevelopment and repair. Please allow EPA Green Street guidance to suffice as other NPDES permits do.

Please insert the TMDLs as originally written and intended. The municipalities and the SDRWQCB spent years developing the TMDL technical documents and approving them as part of the associated Basin Plan Amendment. As briefed by Nancy Palmer and carefully explained in the Orange County comments this is critical for both the Beaches and Creek TMDL, affecting the entire San Diego Region and Baby Beach TMDL. TMDLs by definition are based upon load, not concentration, and please include the necessary reopener provision(s).

The provisions requiring the development and implementation of a Water Quality Improvement Plan can be better aligned with the Jurisdictional Runoff Management Program requirements so that the programs are complimentary and prioritized instead of additive. We believe this is your intent, but the Draft Permit, as written, is unclear and open to conflicting interpretation at this time.

The City also underwent an audit of three key components of the current NPDES MS4 Permit in June of 2012, specifically covering the over-irrigation prohibition, the IC/ID Detection, and the NAL program elements. Although we have not received any feedback regarding the outcome of the audit beyond the debrief that occurred at the end of the audit (which appeared to be positive), we wanted to mention it to ensure that any potentially helpful information obtained was not overlooked in this process.

Again, I would like to emphasize there are many more critical issues contained in Orange County's response letter (attached via reference). We believe that while well intended, some of the draft provisions exceed the Federal Clean Water Act MS4 regulations. Given the potential for third party lawsuits, these are of great concern to our elected officials representing our constituency. As a beach city we are strongly committed to improving water quality. We can still accomplish that progressively with the modifications the County has recommended.

April 10 and 11, 2013
Item No. 8
Supporting Document No. 5

Again, thank you for your past efforts and for continuing consideration of our remaining concerns. The City would like to request the opportunity to meet with you, other Regional Board staff and the County of Orange to review in detail the changes requested in the County letter. Perhaps including the other Counties in the meeting to resolve language issues would be good as well.

Please direct any questions regarding this letter to myself at (949) 248-3582.

Yours sincerely,

Brad J. Fowler, P.E.
Director of Public Works

San Diego, CA 92123-4340

Subject: **Comments on Tentative Order No. R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu.**

Dear Mr. Chiu:

The City of Mission Viejo appreciates the opportunity to provide comments on Tentative Order No. R9-2013-0001, which is intended by the Regional Board to serve as the basis for stormwater regulation in the City upon the expiration of current Order R9-2009-0002. The City has been actively involved in the development of the comprehensive set of comments submitted by the County of Orange and supports those comments and attaches them by reference.

The City appreciates the revisions made by Regional Board staff since the prior Administrative Draft but believes that further changes are necessary, which are included in redline format in the County letter. A number of key issues have been extensively discussed in the focus meetings and Board workshops and, despite some changes, still remain a significant concern to the City. These include:

- The Receiving Water Limitations provisions in the Tentative Order could expose the City to Clean Water Act liabilities for discharges that cause or contribute to an exceedance of a water quality standard. A clear linkage between the compliance provisions and prohibitions, receiving water limitations, and effluent limitations must be established.

- The provisions dealing with land development, Low Impact Development (LID) and hydromodification control are significantly ratcheted up while existing permit programs are only just being implemented and/or pending approval. The City is particularly concerned with the elimination of all exemptions for the hydromodification control requirements, including for discharges to channels that have been engineered to prevent erosion. Exemptions for hydromodification management should include discharges to certain types of receiving waters and certain types of projects.

- The provisions implementing the Beaches and Creeks Total Maximum Daily Load (TMDL) bacteria requirements are inconsistent with the TMDL as it was developed and

200 Civic Center • Mission Viejo, California 92691
http://www.cityofmissionviejo.org

949/470-3056
FAX 949/581-5394

pose additional significant liabilities. Permit provisions must be consistent with the corresponding Basin Plan amendments.

- The provisions requiring the development and implementation of a Water Quality Improvement Plan need to be aligned with the Jurisdictional Runoff Management Program requirements so that the programs are complimentary and prioritized instead of additive.

Thank you for the opportunity to provide comments. The City would like to request the opportunity to meet with you, other Regional Board staff and the County of Orange to review in detail the changes requested in the County letter.

Please direct any questions regarding this letter to Joe Ames, Assistant City Engineer, at 949/470-8419.

Sincerely,

Dennis Wilberg
City Manager

San Diego, CA 92123-4340

Subject: Comment – Tentative Order No. R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu.

Dear Mr. Chiu:

The City of Rancho Santa Margarita appreciates the opportunity to provide comments on Tentative Order No. R9-2013-0001, which is intended by the Regional Board to serve as the basis for stormwater regulation in the City upon the expiration of current Order R9-2009-0002. The City has been actively involved in the development of the comprehensive set of comments submitted by the County of Orange and supports those comments and attaches them by reference.

The City appreciates the revisions made by Regional Board staff since the prior Administrative Draft, but believes that further changes are necessary, which are included in redline format in the County letter. A number of key issues have been extensively discussed in the focus meetings and Board workshops and, despite some changes, still remain a significant concern to the City. These include, without limitation:

- The Receiving Water Limitations provisions in the Tentative Order could expose the City to Clean Water Act liabilities for discharges that cause or contribute to an exceedance of a water quality standard. A clear linkage between the compliance provisions and prohibitions, receiving water limitations, and effluent limitations must be established.

- The provisions dealing with land development, Low Impact Development (LID) and hydromodification control are significantly ratcheted up while existing permit programs are only just being implemented and/or pending approval. In addition, many of the land development requirements conflict with applicable federal and/or state constitutional provisions, laws and court decisions and may not be practically enforceable.

- The City is particularly concerned with the elimination of all exemptions for the hydromodification control requirements, including for discharges to channels that have been engineered to prevent erosion. Exemptions for hydromodification management should include discharges to certain types of receiving waters and certain types of projects.

- The provisions implementing the Beaches and Creeks Total Maximum Daily Load (TMDL) bacteria requirements are inconsistent with the TMDL as it was developed and pose additional significant liabilities. Permit provisions must be consistent with the corresponding Basin Plan amendments.

- The provisions requiring the development and implementation of a Water Quality Improvement Plan need to be aligned with the Jurisdictional Runoff Management Program requirements so that the programs are complimentary and prioritized instead of additive.

Thank you for the opportunity to provide comments. The City would like to request the opportunity to meet with you, other Regional Board staff and the County of Orange to review in detail the changes requested in the County letter.

San Diego, CA 92123-4340

Subject: **City of Vista Comments – Tentative Order No. R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu**

Dear Mr. Chiu:

The City of Vista appreciates the efforts that the Regional Water Board staff has undertaken to involve the stakeholders in the development of the new permit. The early release of the administrative draft, subsequent focused meetings, and revisions incorporated into the Tentative Order have resulted in a Tentative Order that is much improved and will allow stormwater programs in the region to make meaningful progress towards improving water quality.

The City of Vista participated in the development of the comments submitted by the County of San Diego on behalf of the 21 Copermittees in San Diego County. We support the comments and look forward to their inclusion in the Final Order. Additionally, a couple of comments are included in the attached table related to the Land Development Provisions for consideration.

We understand the need to balance the collaborative process in the development of the permit with the regulatory oversight incumbent on the Regional Water Quality Control Board. Thank you for the opportunities provided for the Copermittees to add their experience and insights to the process. Please contact Paul Hartman at (760) 726-1340 x1373 or at phartman@cityofvista.com with any questions related to our comments.

Sincerely,

Greg Mayer
City Engineer

Attachment 1 - City of Vista Comments on Tentative Order R9-2013-0001

Permit Section	Tentative Order Page	Section Title	Reason for Prosed Change/Comments	Proposed Changes
E.3.c.(1)(a)	78	Development Planning - Structural BMP Performance Requirements (Stormwater Pollutant Control BMP Requirements)	LID is intended to retain the first flush up to the 85th percentile runoff difference. In San Diego County, the 24 hour - 85^{th} percentile precipitation event (P_{85}) usually generates runoff in natural conditions, as impervious soils (Type D) and poor or fair natural vegetation are predominant in the County. Runoff as a percentage of precipitation is dependent on the conditions of the natural terrain and the size of P85. The removal of this naturally occurring runoff as required in Section E.3.c.(1)(a)(i) may create an environmental problem in downstream wetlands, where critical habitat depends on this runoff for survival.	Modify E.3.c.(1)(a)(i) to read "The volume of storm water produced from a 24-hour 85th percentile storm event in post-development conditions less the volume of storm water produced by the same storm under natural conditions[26]" Modify footnote 26 to read "LID is intended to retain the first flush up to the 85th percentile runoff difference. The 85th percentile runoff in natural conditions will depend on the original natural vegetation and soil type."
E.3.c.(3)(b)(i)[c]	82	Alternative Compliance to Onsite Structural BMP Performance Requirements	The selection of 1.5 does not appear to be scientifically based. It is understood that a number greater than one is needed, but such a number could also be obtained from a concentration load – runoff analysis. The permit should have flexibility for projects where a more accurate scientific justification is provided.	Modify section E.3.c.(3)(b)(i)[c] to read "Biofilter at least 1.5 the design capture volume that is not reliably retained onsite, or biofilter a volume that demonstrates an equivalent load reduction that would occur if a retention LID volume is in place;"

Re: Tentative Order R9-2013-0001

Dear Catherine:

On behalf of our client the County of San Diego, I am writing concerning some provisions in Tentative Order R9-2013-0001 that are of particular concern to the County. I respectfully ask that you review our legal position on those provisions as outlined below, and please call me to discuss if you have any questions or need further information to assist your review.

The Bacteria TMDL Resolution

The Tentative Order would incorporate elements and requirements from the Bacteria TMDL Resolution (Resolution R9-2010-0001) into the new MS4 permit for San Diego Region copermittees, including the County of San Diego. We specifically urge the San Diego Regional Board to not incorporate the Bacteria TMDL provisions in this permit renewal cycle. It is our legal position that your Board has the authority to decline the demands of other interested parties that this action be taken.

Reasons Not to Incorporate the Bacteria TMDL Into the Permit

From a recent summary by Regional Board (RB) staff, County of San Diego copermittees spend approximately \$119M per year on programs to improve water quality in the San Diego region. Those programs have improved water quality in general and at beaches in the region. With ever-increasing knowledge gained through trial and error, and with the Watershed Quality Improvement Plan concept expected to permit existing resources to be focused in more efficient and effective ways, San Diego copermittees expect to continue the march toward improved water quality using the current level of resources. The copermittees are continually working on ways to improve water quality and have done so for over two decades. As evident in our annual expenditure and work with experts, we are committed to improving water quality.

By RB staff estimates and as confirmed by San Diego copermittees, the implementation of the Bacteria TMDL in the next permit cycle would add a magnitude of additional costs to copermittee budgets that is unsustainable using existing methods for raising general fund monies and given California's legal constraints on taxation or fees. As your Board has heard, the range of additional cost attributable to the Bacteria TMDL alone is \$144M to \$272M per year, meaning billions of taxpayer dollars over the compliance period.

As presentations in the adoption process have shown, given the unique challenges associated with bacteria as a constituent in stormwater, the cost-benefit analysis dictates that implementing the Bacteria TMDL at this time, as written, would be bad public policy. Studies and experience show that any magnitude of controls for bacteria, up to and including disinfectant efforts, will not consistently achieve the Resolution's numeric standards, even with the expenditure of billions of dollars. So, the sensible, logical next step is to take a hard look at the standards and assumptions of the Bacteria TMDL and devise plans to improve water quality using existing resources and as realistically achievable with today's scientific methods.

<u>Legal Authority to Not Incorporate the Bacteria TMDL Into the Permit</u>

As you know in 1987, Congress declared its intent to chart a different course for improving water quality flowing from MS4 systems by enacting Clean Water Act § 402 (33 U.S.C. § 1342). In establishing the "maximum extent practicable" (MEP) standard of CWA § 402(p)(3)(B), Congress recognized and enacted a different standard than the technology based requirements of CWA § 301. The MEP standard is the legal standard for stormwater compliance.

In *Defenders of Wildlife v. Browner,* 191 F.3d 1159 (1999) the Ninth Circuit held that the MEP standard of CWA § 402(p)(3)(B) *replaces* the requirements of CWA § 301(b)(1)(C) for MS4 dischargers. The *Browner* decision goes on to discuss the discretion vested in permitting authorities to either require strict compliance, or less than strict compliance, with water quality standards.

Our office believes that the November 12, 2010 EPA memorandum concerning the incorporation and use of numeric WQBELs in permits is not dispositive of this issue. As acknowledged in its March 17, 2011 letter, EPA is still considering whether to retain, reissue, or withdraw the 2010 memorandum. And, in the same letter, EPA acknowledges that the 2010 memorandum, "does not impose legally binding requirements on EPA, States, or the regulated community, nor does it confer legal rights or impose legal obligations on any member of the public."

With regard to the unique challenges associated with bacteria control, the science shows that consistent achievement of the Bacteria TMDL numeric standards is not possible, even with any level of expenditure. Therefore, imposing the 2010 Bacteria TMDL provisions as permit conditions would exceed the "maximum extent practicable" standard. Accordingly, we believe your Board is vested with the discretion to elect not to incorporate the Bacteria TMDL provisions at this time.

Your Board would be justified to open a process to revisit and re-examine the Bacteria TMDL assumptions in the context of its basin planning process, instead of taking the irrevocable step of incorporating the TMDL into the permit and potentially wasting valuable taxpayer dollars that could better be spent on achievable water quality improvement goals.

Receiving Water Limitations (RWL) Language

As you know, the copermittees have expressed significant concerns about third-party liability risks resulting from the Ninth Circuit's interpretation of receiving water limitation language in the L.A. Region's stormwater permit. While we appreciate the State Water Resources Control Board's willingness to take comment and review those concerns, it may take several months for the State Board to act. The Tentative Order retains language similar to the problematic language reviewed in the *NRDC* case; this leaves the County and other copermittees immediately exposed to similar litigation from third parties for violations of water quality standards. We know that several various proposals to modify RWL language have been presented at state and local levels.

We suggest a simple solution consistent with Congress' intent in enacting CWA § 402 as discussed above: simply remove the RWL language in Provision A of the Tentative Order. Federal law does not require imposition of the receiving water limitations for MS4 systems. There is precedent for this action; a number of EPA issued stormwater permits throughout the country do not include this language. Your Board has the discretion under CWA § 402 and *Browner* to remove the language. If EPA does not consider the RWL language to be essential to its own MS4 permitting, it seems logical that your Board is not required to include it in the new permit.

State Water Board policy supports the iterative process approach to water quality improvement, and acknowledges that water quality standards for many pollutants from MS4s cannot be met immediately. Therefore it is unrealistic and at odds with the iterative process to enact a standard that puts the third-party lawsuit gun to the head of public entities diligently spending significant time and public money pursuing water quality improvement. The permit would still include its enforceable prescriptive requirements and the WQIP features that all parties believe will focus resources in each watershed in the most productive fashion. Over the past two decades, the region has developed the knowledge and skill set to improve water quality, but understands that only through an iterative process can true progress be made.

Removal of the RWL language would eliminate the inevitable jousting over modified language proposals and the uncertainty created by its retention in light of the *NRDC* ruling. Copermittees would simply be obligated to focus on permit condition compliance, including the tasks identified in approved WQIPs, subject to RB enforcement if appropriate. Removal of the language would not create a "free pass"; to the contrary, it would encourage effective water quality monitoring and reporting that might otherwise be discouraged by the specter of third party lawsuits like those filed in the *NRDC* and other cases.

Land Development Standards/Hydromodification Issues

County Counsel concurs with the legal concerns sent to your attention in the December 19, 2012 letter from the Office of the City Attorney of the City of San Diego. The letter points out potential constitutional issues with hydromodification requirements imposed in the Tentative Order. We urge you to recommend modifying the referenced provisions to avoid the potential consequences for copermittees outlined in the letter.

The County also urges the Regional Board to amend the Tentative Order to incorporate the approved hydromodification management plan (HMP) for San Diego County into the permit, and remove provisions of the Tentative Order that are inconsistent with the HMP. As you know, the HMP was developed at significant cost to copermittees, and has only recently been implemented. Therefore, scrapping key components and changing the baseline standard for redevelopment to the questionable "pre-development" standard without further study of the effectiveness of the HMP as implemented is legally inconsistent with the premise upon which the HMP was required to be developed in the first instance. Our client is submitting a more comprehensive technical comment on the HMP issue for your review.

Other legal concerns with various Tentative Order provisions will be woven into the comprehensive written comments to be submitted by the County and copermittees. Because of the potential impact of the above provisions of the Tentative Order for our client, we urge you to review and revise your recommendations to the Regional Board. Our mutual goal should be a permit that realistically and responsibly advances the march toward improved water quality in the region using available existing resources. As always, thank you for your consideration.

Very truly yours,

THOMAS E. MONTGOMERY, County Counsel

January 10, 2013

Wayne Chiu, P.E.
California Regional Water Quality Control Board,
San Diego Region
9174 Sky Park Court, Suite 100
San Diego California 92123-4340

Dear Mr. Chiu:

SUBJECT: COMMENT - TENTATIVE ORDER NO. R9-2013-0001, REGIONAL MS4 PERMIT, PLACE ID: 786088WCHIU

On behalf of Navy Region Southwest I respectfully submit these comments on the draft Regional MS4 Permit.

In a conscious policy decision, supported by the CWA, the MS4 permit mandates toxicity monitoring for receiving waters. This policy direction recognizes some very important and unique aspects of storm water discharges namely; they are intermittent, flow is unpredictable, and they are short duration representing a very temporary condition in the receiving water.

Receiving water toxicity testing is consistent with the San Diego Region Basin Plan which states that *"All waters shall be maintained free of toxic substances in concentrations that are toxic, or that produce detrimental physiological responses in human, plant, animal, or aquatic life"*. It is also consistent with the current draft of the State Water Board Policy for Toxicity Assessment and Control as well as the recently adopted Framework for Monitoring and Assessment in the San Diego Region. Together these documents insure that reliable and statistically and scientifically sound information is produced to show permit compliance, and guide decisions about, and the evaluation of, the progress of efforts to protect and restore the quality and beneficial uses of waters in the San Diego Region.

The Navy supports the use of toxicity testing of the receiving water as described in Provision D Monitoring and Assessment Program Requirements. Toxicity testing of the receiving water, as opposed to testing 100% storm water, is protective of water quality and beneficial uses and accurately measures toxicity impacts from storm water discharges.

Lastly, as articulated in the MS4 Fact sheet F-36:

> *"[t]he inclusion of receiving water limitations is also consistent with the Ninth Circuit Court of Appeals' ruling in Defenders of Wildlife v. Browner (191 F.3d 1159, 1166 (1999)) that the permitting authority has discretion regarding the nature and timing of requirements that it includes as MS4 permit conditions to attain water quality standards."*

We support the San Diego Regional Board's use of toxicity testing of the receiving water in all NPDES Stormwater Permits where toxicity limitations or monitoring requirements are determined necessary to insure water quality protection. This position is supported by the CWA, Porter Cologne Act, State Policy, US EPA-approved Regional Basin plans.

The Navy requests that you consider these comments in the upcoming permit adoption. The points of contact for this letter are Mr. Christopher Haynes at christopher.a.haynes@navy.mil or (619)532-2285 and Mr. Brian Gordon at brian.gordon@navy.mil or (619)532-2273.

Sincerely,

Brian S. Gordon

RIVERSIDE COUNTY FLOOD CONTROL
AND WATER CONSERVATION DISTRICT

January 10, 2013

Mr. Wayne Chiu, P.E.
California Regional Water Quality
Control Board, San Diego Region
9174 Sky Park Court, Suite 100
San Diego, California 92123-4340

Dear Mr. Chiu:

Re: Tentative Order No. R9-2013-0001
Regional MS4 Permit
Place ID: 786088Wchiu

The Riverside County Flood Control and Water Conservation District (District) is submitting this comment letter on the above listed Tentative Draft Order on behalf of the Riverside County MS4 Copermittees within the San Diego Region (Riverside County Copermittees) which includes the District, the County of Riverside and the Cities of Murrieta, Temecula and Wildomar. Tentative Draft Order R9-2013-0001 (Draft Permit) was drafted by Board staff to cover Phase I municipal separate storm sewer system (MS4) Copermittees in San Diego County, southern Orange County, and the portion of southwestern Riverside County within the Santa Margarita Hydrologic Unit.

The Riverside County Copermittees have previously commented that the San Diego Water Board lacks authority to adopt a regional permit covering Orange and Riverside Counties, in addition to San Diego County; a comment which is discussed in further detail below and in the attached legal comments. Notwithstanding such objection, and subject to it, the Riverside County Copermittees are providing comments on the Draft Permit.

In the workshop on the Administrative Draft Order held on April 22, 2012 San Diego Water Board staff identified the following desired outcomes for the proposed permit:

- Improving the quality of water discharged from the MS4
- Restoring or enhancing Beneficial Uses and Receiving Water quality

It was further identified by Board staff that to be able to meet those goals, the proposed regional MS4 permit needed to be 1) Strategic, 2) Adaptive, and 3) Synergistic.

Notwithstanding the concerns of the Riverside County Copermittees with regard to the legal authority to issue a regional MS4 permit, the Copermittees agree that being able to adapt and direct resources toward specific water quality priorities in a given watershed, rather than all potential problems simultaneously, is more likely to result in actual and meaningful improvements in water quality. However, to be able to achieve those improvements the MS4 Permit must be crafted to provide the Copermittees with the ability to truly and fully adaptively manage their programs to focus resources on those BMP strategies and monitoring efforts that are identified as being most effective, consistent with the MEP standard, at addressing watershed priorities.

Unfortunately, many provisions in the Draft Permit, including but not limited to the Receiving Water limitation provisions in Provision A and others discussed in this letter, still do not fully support the achievement of those outcomes. The Draft Permit does not provide the Copermittees with the flexibility to be fully strategic in managing their resources nor the ability to fully adapt their programs to focus on the highest priority water quality needs of the watershed. This comment letter and the other documents submitted herewith (a redline of the Draft Permit and Legal Comments) identify some suggestions which, if adopted by the San Diego Water Board, will help to address these limitations and facilitate the desired improvements.

This comment letter is organized as follows:

As noted, the Riverside County Copermittees also are submitting a redline of the Draft Permit ("Redline") that proposes alternative language intended at achieving solutions to the various issues raised in this letter, and a Legal Comment document ("Legal Comments") that provides additional legal context for the various issues raised in this letter. The Riverside County Copermittees reserve their right, in the context of filing a Report of Waste Discharge ("ROWD") prior to the expiration of Order R9-2010-0016 (the 2010 MS4 Permit), to again address these issues and others relevant and appropriate to the SMR.

1 BACKGROUND

The Riverside County Copermittees were issued an extensive and prescriptive MS4 Permit in November 2010 which greatly expanded monitoring obligations, required special studies, a jurisdictional runoff management program, and Watershed Workplan requirements that were very different than the requirements set forth in the previous MS4 Permit issued to the Copermittees. Development and implementation of the 2010 MS4 Permit compliance requirements has been very expensive, especially in comparison to the relatively few demonstrated impairments of Beneficial Uses in the region and the Copermittees' resources. These requirements have left other important societal needs unfulfilled by the Riverside County Copermittees during a period of unprecedented and continuing economic distress. Further, the Riverside County Copermittees are still in the process of developing and implementing these 2010 MS4 Permit requirements, which is a serious concern given the very different compliance approach proposed in the Draft Permit. The Copermittees hope that the compliance efforts under the current MS4 Permit are taken into account when they submit their ROWD at the expiration of the 2010 MS4 Permit.

2 General Comments

2.1 Regional Permit

The Riverside County Copermittees respectfully submit that the San Diego Water Board is not authorized under the Clean Water Act or under its implementing regulations to issue a regional permit to Copermittees in San Diego County, South Orange County and the Santa Margarita Region (SMR) of Riverside County. As discussed more fully in the Legal Comments, the only circumstance under which the San Diego Water Board could issue such a permit would be if the Copermittees in these counties agreed to such a permit. Additionally, while the Draft Permit purports to affect the conduct of the Riverside County Copermittees upon expiration of the 2010 MS4 Permit in November 2015, the Riverside County Copermittees have not submitted a ROWD requesting coverage under a regional permit. Because no application has been made for the regional permit, which is a requirement set forth in the CWA regulations, the San Diego Water Board lacks jurisdiction to name the Riverside County Copermittees on the Draft Permit at this time.

Notwithstanding the above, the Riverside County Copermittees are submitting the comments in this letter based on:

- The San Diego Water Board staff's stated intent to enroll the Riverside County Copermittees in this permit upon expiration of the 2010 MS4 Permit.
- Statements made by San Diego Water Board staff that this comment period would serve as the primary opportunity for the Riverside County Copermittees to influence their next term MS4 Permit. The Riverside County Copermittees are entitled, as part of the ROWD process, to again raise relevant issues regarding permit provisions, but have undertaken in these comments to address major current concerns.

2.2 Outcome Focus

As mentioned above, the Copermittees agree that being able to adapt and direct resources toward addressing the specific water quality priorities in a given watershed, rather than all potential problems simultaneously, is more likely to result in actual/meaningful improvements in water quality. However, to be able to achieve those improvements, the MS4 Permit must fully integrate the following principles:

- **The Jurisdictional Program requirements must be fully flexible:** The Permit must be written in a way that allows the Copermittees to truly and adaptively manage their programs to fully focus their existing resources on those BMP strategies and monitoring efforts that are identified within the Water Quality Improvement Plan (WQIP) as being most effective, consistent with the Maximum Extent Practicable (MEP) standard, at addressing the watershed's priorities. We understand this to be the goal of the San Diego Water Board as well. While some elements of the Draft Permit embody this need, others do not and require dedication of resources to specific pre-defined efforts, regardless of the identified need for that effort in the watershed. The specific program areas that need more work to this end are:
    - The approach to addressing Non-stormwater discharges
    - Development Planning
    - Retrofitting
    - Channel Rehabilitation

These issues and proposed new language to address these issues are included throughout this letter and/or in the attached Redline.

- **Basin Plan updates need to be Prioritized by the San Diego Water Board:** For outcome-based permitting to be successful, the desired outcomes must be achievable by and appropriate to the Copermittee. To do that, the outcomes must take into account the background conditions in the watershed, and be appropriate for the attainment of Beneficial Uses in the specific waterbody, based on the specific conditions within and influencing that waterbody. The values in the Basin Plan should be comprehensively re-evaluated to ensure that water quality standards are scientifically justified to protect Beneficial Uses. Without updating the Basin Plan, the outcomes that the Copermittees target in the WQIPs would be arbitrary and not guaranteed to achieve the desired beneficial use improvements. Such an update should be pursued aggressively, led by and adequately funded by the San Diego Water Board, with participation by the MS4 Copermittees and other dischargers and stakeholders in the watershed.

- **Other Dischargers need to be Similarly Regulated by the San Diego Water Board:** The MS4 Copermittees are not the only dischargers of pollutants in the watershed. For example, the SMR of Riverside County includes State Lands (such as Caltrans), Tribal Lands, Agricultural Operators, Industrial Permit dischargers, Construction Permit dischargers, Phase II entities, Water Districts, and 'De Minimus' dischargers issued general permit coverage; all of which:

- Have separate regulatory programs (such as permits or waivers) implemented by the San Diego Water Board;
- May discharge pollutants, including non-stormwater, that can affect the quantity and quality of runoff, both directly within Receiving Waters, and in runoff discharges that may enter into and be discharged from the MS4; and
- Cannot be regulated by the Copermittees for the quantity and quality of their runoff because of their separate permits or waivers granted by the NPDES Program Administrator.

As such, while MS4 Copermittees can implement programs to reduce pollutants in discharges that are within their legal jurisdiction, no amount of effort by the MS4 Copermittees can be expected to fully attain water quality standards in the Receiving Waters. The only way to achieve that outcome will be for the NPDES Program Administrator (the San Diego Water Board in most cases) to directly regulate each of these entities to similar levels and standards as set forth by this Permit.

2.3 Responsibility for meeting goals of CWA

The CWA requires Copermittees subject to any MS4 permit, including the Draft Permit, only to address discharges from their MS4s. 33 U.S.C. § 1342(p)(3)(B). The Copermittees are not required to restore Beneficial Uses in any Receiving Water, or to address sources of pollution to those Receiving Waters that are not being discharged into or from those MS4s. However, in various provisions in the Draft Permit, there is a suggestion that the Copermittees are solely responsible for attaining water quality standards in their respective Receiving Waters. The San Diego Water Board must make clear in the Draft Permit that the responsibilities of the Copermittees are limited to their MS4s and the requirements of the CWA for municipal stormwater dischargers. Redline changes have been proposed in the above referenced portions of the Draft Permit to address this issue.

3 Specific Comments

The following comments represent specific high level concerns that the Riverside County Copermittees have identified at this time. Additional comments on the Draft Permit can be found in the Redline, as well as in the attached Legal Comments.

3.1 Findings

The Riverside County Copermittees have two separate sets of comments on the Findings. The first addresses the need for additional findings, with respect to aspects of California law and the physical setting of the SMR. The second set of comments focuses on existing Findings in the Draft Permit.

3.1.1 Needed Additional Findings

The Findings in the Draft Permit fail to fully address the context and conditions under which the proposed permit requirements are to be applied. A more complete explanation of this background is necessary to ensure that the Provisions ultimately included in the Draft Permit are credible, appropriate and legally required, and that the Permit Provisions (which must stem from the Findings) reflect the context of the broader issues that affect MS4s within the region. The Riverside County Copermittees request that San Diego Water Board staff work with the MS4 Copermittees to expand the Findings, including the addition of findings to address the following:

California Water Law

California law requires that downstream entities must accept runoff from up-gradient properties. Owners and operators of MS4s are not exempt from this legal mandate, even if that runoff contains pollutants. Moreover, flood control districts, including the District, are mandated by the California Legislature (Legislature) to protect the lives and property of residents from floodwaters. The Riverside County Copermittees request that a finding, in the form set forth in the Redlines, be added to the Draft Permit.

Flooding

Many areas that would be under the jurisdiction of the Draft Permit are subject to periodic catastrophic flooding, which results from natural conditions, specifically the presence of mountains and hilly areas in close proximity to development, along with the effect of strong Pacific storms. This flooding would occur even in the absence of development. The Legislature recognized the importance of this issue in the early 20th Century, when it established flood control districts across the state, including in Riverside, Orange and San Diego Counties. Such flooding has, and if not controlled, could result in loss of life and widespread property damage. Further, the flooding can mobilize significant amounts of pollutants from industrial, commercial, residential and agricultural lands, damaging watercourses, habitat, and the Beneficial Uses therein. MS4 systems are designed and constructed to mitigate these impacts. The Riverside County Copermittees request that a finding in the form set forth in the Redline be added to the Draft Permit.

Flood Control District Acts

As noted above, the Legislature established Flood Control Districts in Orange, Riverside, and San Diego Counties through a series of Flood Control Acts. The Legislature determined that protection of life and property from the effects of flooding through the implementation of flood control improvements was a priority, and assigned those Districts with the sole responsibility to design, construct and maintain those improvements necessary to manage and contain floodwaters to prevent such negative impacts, as well as to conserve floodwaters for beneficial use. As noted above, these improvements represent fundamental water quality BMPs inasmuch as they reduce the widespread exposure of runoff to pollutants. The Flood Control Districts, while owners and operators of MS4s, have no authority or powers beyond those granted by the Legislature. The Legislature did not provide the Flood Control Districts, for example, the authority to regulate land uses within the municipal jurisdictions of Riverside County, nor to control the volume or quality of runoff discharged by those land uses. Findings describing the legislative priority for flood control and the limitations on the governing power of the Flood Control Districts should be added to set forth the appropriate role of the Flood Control Districts as MS4 Copermittees. The Riverside County Copermittees request that a finding, in the form set forth in the Redline, be added to the Draft Permit.

Limits on Extent of Permittee Legal Authority

The MS4 Copermittees lack the authority to regulate many significant sources of pollutants that may impact Receiving Waters. For example, the Copermittees cannot regulate pollutants discharged from federal and state lands, facilities, tribal lands, special districts, utilities, agricultural lands, or railroads. Moreover, the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) preclude local regulation of pesticides. The Riverside County Copermittees request that a finding in the form set forth in the Redline be added to the Draft Permit.

3.1.2 Comments on Existing Findings

Findings 3 and 15 (and elsewhere in Draft Permit)

In Findings 3 and 15 (and throughout the Draft Permit), it is stated that the CWA requires controls to reduce the discharge of pollutants "in stormwater" to the MEP. Finding 15, moreover, states that non-stormwater discharges from the MS4 are "not considered stormwater discharges and therefore are not subject to the MEP standard, stating that the MEP standard "is explicitly for 'Municipal . . . Stormwater Discharges" from the MS4s.

These conclusions are directly contrary to the plain language of the CWA, as set forth in the November 16, 1990 preamble accompanying the CWA stormwater regulations. Those authorities provide that the MEP standard applies to *all* pollutants discharged from the MS4, notwithstanding that some may be transported by non-stormwater. Additionally, the Redline reflects deletion of the limitation of the MEP standard to stormwater discharges in multiple locations, reflecting federal law. For a further discussion of this issue, please see the Legal Comments. The Riverside County Copermittees also request deletion of Finding 15.

Finding 11

This Finding states that "[r]ivers, streams and creeks in developed areas used [to convey runoff] . . . are part of the Copermittees' MS4s regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the rivers, streams and creeks in the developed areas of the Copermittees' jurisdictions are both an MS4 and Receiving Water." This statement is incorrect and must be deleted (as reflected in the Redline). For reasons more fully set forth in the Legal Comments, natural streams cannot be considered MS4; there is no MS4 "outfall" from a channelized river or stream to a natural stream; and, USEPA itself requires a distinction between MS4s and Receiving Waters.

Finding 12

This Finding states that as operators of MS4s, "Copermittees cannot passively receive and discharge pollutants from third parties." By providing free and open access to an MS4 that conveys discharges to Waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or otherwise control. This statement is incorrect and must be deleted (as set forth in the Redline). As the discussion in the Legal Comments indicates, municipalities must maintain the MS4 to protect the lives and property of their citizens and to prevent nuisance. Flood Control Districts have a statutory obligation to operate and maintain such MS4, an obligation which is not affected by either the CWA or the terms of the Draft Permit. While an MS4 operator has the obligation to effectively prohibit the entry of non-stormwater into the MS4, it does not have legal responsibility for such discharges, which are the responsibility of the discharger itself and subject to the jurisdiction of the San Diego Water Board, pursuant to Water Code section 13260 *et seq.*

Finding 28

This Finding recites that the San Diego Water Board finds that the requirements of the Draft Permit "are not more stringent than the minimum federal requirements." The Riverside County Copermittees disagree with this finding, as it is not supported by the evidence, *i.e.,* the many requirements in the Draft Permit which exceed the federal MEP standard. Moreover, any decision by the San Diego Water Board to adopt "other provisions" going beyond MEP is not a federal requirement, but rather a discretionary decision taken by a state agency under authorization in the CWA. *See Defenders of Wildlife v. Browner,* 191 F.3d 1159, 1164-65 (9th Cir. 1999). Please see discussion in the Legal Comments. The Finding also indicates that the San Diego Water Board has developed an economic analysis of the Draft Permit. As set forth in the Legal Comments, the Riverside County Copermittees challenge the adequacy of that analysis.

Finding 29

This finding purports to find that the Draft Permit does not constitute an unfunded state mandate. The Riverside County Copermittees disagree with the conclusions set forth in this finding. More importantly, the finding is without legal effect because exclusive jurisdiction as to whether a state mandate exists, and whether it is unfunded lies with the Commission on State Mandates. Government Code §§ 17751 and 17552; *Lucia Mar Unified School District v. Honig* (1988) 44 Cal.3d 830, 837; *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1546, 1596-97. The finding of an agency that has no jurisdiction to make that finding is entitled to no weight and should be deleted, as shown in the Redline. For an additional discussion of these issues, please see the Legal Comments.

Finding 31

The Riverside County Copermittees believe that the Receiving Water Limitation ("RWL") language set forth in the Draft Permit renders compliance with the permit impossible, since exceedances of water quality standards occur routinely through no fault of the MS4 Permittees. Thus, unless the RWL is modified to provide the Copermittees with a means to be in compliance, those Copermittees risk the threat of arbitrary San Diego Water Board enforcement or the bringing of citizen suit lawsuits under the CWA, which could nullify compliance with all other terms set forth in the Draft Permit, as discussed more fully in the Legal Comments. The exposure to third party litigation from the proposed RWL language is one of the most significant threats to an otherwise collaborative approach to achieving long term water quality improvement. This threat was emphasized by the recent bringing of a citizen suit lawsuit against the City of Malibu, the County of Los Angeles and the Los Angeles County Flood Control District based on similar language in the 2001 Los Angeles County MS4 Permit. The Riverside County Copermittees have suggested modifications to Provision A in the Redline and as discussed below and in the Legal Comments that are intended to better support the Iterative Process for compliance authorized by the State Water Resources Control Board in Order No.

2001-15, through the WQIP process. The Copermittees also note that the State Board considered the problems with the RWL language at a recent workshop, which may eventually result in modifications which should, if applicable, be reflected in the Draft Permit. Other requested changes to the Findings are set forth in the Redline.

3.2 Provision A, Prohibitions and Limitations

As noted above, the requirements set forth in Provision A are of great concern to the Riverside County Copermittees. The Copermittees generally support an approach to compliance that utilizes WIQPs as the implementing mechanism for the 'Iterative Process' described in Provision A.4, and that by implementing that iterative process in accordance with A.4, that the Copermittee should be in compliance with Provisions A.1 and A.2. The Redline reflects edits of Provision A to clarify the linkage between the prohibitions and limitations in Provisions A.1. through A.3. and Provision A.4 – which is described as the method for complying with the prohibitions and limitations. It must be noted, however, that the Riverside County Copermittees do not agree with the approach suggested, that any WQIP-based compliance approach be necessarily accompanied by a Reasonable Assurance Analysis. Such analyses can be extremely complex, expensive and time-intensive to develop, and similar analyses are commonly developed within TMDL models; taking a number of years to develop and refine. Given that the Santa Margarita Watershed has no adopted TMDLs; thus, comprehensive pollutant transport and BMP models are not available for the suite of constituents that might be considered for prioritization within a WQIP for the Santa Margarita Watershed. In the context of a TMDL, such models would be developed by the combined resources of the San Diego Water Board and a range of stakeholders and dischargers. Undertaking such an exercise solely with the public resources of the 275,000 residents of the SMR is beyond the financial ability of the Copermittees and would shift the responsibility for development of TMDLs from the San Diego Water Board to the Copermittees. Comments on Provision A can be found below, in the Redline and in the Legal Comments.

3.2.1 Overview of Key Issues

As noted above, an overriding issue for the Riverside County Copermittees is having a permit that, while being appropriately proactive and aggressive at addressing the prioritized water quality conditions with the Receiving Waters, is one that all Copermittees can remain in compliance with while implementing those requirements. As presently drafted (and as made clear by statements in the Fact Sheet), Provision A imposes immediate potential liability on every Copermittee if monitoring in the Receiving Waters reflects exceedances of water quality standards that may have been caused or contributed to by MS4 discharges. San Diego Water Board staff has repeatedly indicated in workshop presentations that they expect that Copermittees will not be able to comply with the Receiving Water Limitations and Discharge Prohibitions for some time. Staff has separately indicated that they are interested in having the Copermittees undertake bold initiatives in trying to address urban runoff pollution, and that the Copermittees have actually been encouraged to "fail early and fail often" as this would reflect such progress in refining these initiatives. The iterative, flexible and priority-setting approach reflected in the WQIP is intended to allow the Copermittees to focus on the most important problems in their watershed. The entire approach is endangered, however, by RWL provisions which would allow either the San Diego Water Board or a citizen plaintiff to sue the Copermittees for any individual exceedance of the

RWLs. Under the current version of Provision A, the unmitigated risk of such actions leads not to bold initiatives but rather to attempts to minimize liability.

As set forth in the Legal Comments, this approach is not mandated by the CWA, State Board orders or the opinion of the Ninth Circuit Court of Appeals in *Natural Resources Defense Council v. County of Los Angeles*, 673 F.3d 880 (9th Cir. 2011), *reversed,* 568 U.S. __ (January 8, 2013). As importantly, the threat of immediate potential noncompliance actually interferes with the ability of the Copermittees, including the Riverside County Copermittees, to comply with the Draft Permit. Instead of being able to focus on pollutants of highest concern in the watershed, as called for in the WQIP, the Copermittees will be forced to try to address every pollutant monitored, since the exceedance of any water quality standard leads to immediate potential liability. Moreover, because citizen plaintiffs are entitled to injunctive relief under Section 505(a) of the CWA, a federal judge could order the Copermittees to undertake steps completely independent of the WQIP or other compliance provisions in the Draft Permit.

The Riverside County Copermittees do not object to compliance provisions that will provide a means to achieve real improvement in water quality. The Copermittees are willing to undertake these Provisions, because the success or failure is in their control. Compliance with the requirements of Provision A, however, is beyond the control of the Copermittees. Based on the statements made during the workshop process, the Riverside County Copermittees believe that the San Diego Water Board is serious about working with the Copermittees on a permit that provides flexibility and problem solving approaches. To ensure that this flexibility is not lost, the Draft Permit must tie in compliance with Provisions A.1 through A.3 to a process set forth in Provision A.4. This approach is shown in the Redline and is discussed further below.

3.2.2 Comments in support of specific changes

Provision A, Introduction

The introduction notes that pollutants "in stormwater discharges" from the MS4 must be controlled to the MEP. As discussed above, the CWA does not differentiate between stormwater and non-stormwater discharges from the MS4; both must be controlled to the MEP standard. The Riverside County Copermittees have requested revised language in the Redline. Additionally, the linkage between compliance with Discharge Prohibitions (Provision A.1), Receiving Water Limitations (Provision A.2) and Effluent Limitations (Provision A.3) should be noted as being defined by Provision A.4. This change is reflected in the Redline.

A.1.a

First, language must be added providing that compliance may be addressed through the process set forth in Provision A.4. This language is provided in the Redline. Second, the Provision prohibiting discharges which are "threatening to cause" a condition of pollution, etc., is unenforceable, because it prohibits an action that, with respect to MS4 operators, is beyond their control. Moreover, there is no authority for such provisions in the Porter-Cologne Act. The Riverside County Copermittees request deletion of this phrase, as shown in the Redline. Additionally, as set forth in the Legal Comments, the Provision improperly expands the Discharge Prohibitions to Waters of the State.

A.1.b

40 CFR § 122.26(d)(2)(iv)(B)(1) clarifies that the requirement for an MS4 Copermittee to "effectively prohibit" the discharge of Non-stormwater/illegal discharges into its MS4s is to be accomplished through "a program, including inspections, to implement and enforce an ordinance, orders or similar means…". The language of this Provision should reflect federal law in this respect. The Redline reflects this change.

A.1.c

First, this Provision requires the Copermittees to comply with the Basin Plan prohibitions listed in Attachment A. This list is over-inclusive, as it contains requirements that are not applicable to some or all of the Copermittees' MS4 discharges, or to the Riverside County Copermittees in particular. The Riverside County Copermittees request that this Provision be amended to read as follows: "Discharges from MS4s are subject to all applicable waste Discharge Prohibitions in the Basin Plan." This change is noted in the Redline. Second, language must be added providing that compliance with this restriction can be obtained through the process set forth in Provision A.4. This language is provided in the Redline.

A.2.a

First, this Provision and Provisions A.1. and A.3 should be linked to the iterative process described in A.4. Please see the Redline.

Second, not all plans, policies, etc. set forth in Provision A.2.a.(1)-(4) may qualify as "water quality standards" or be applicable to all the MS4 Copermittees. These subsections should be deleted, and replaced with a reference to "Water Quality Standards," which is a defined term in the Draft Permit (This change is reflected in the Redline). Otherwise, the MS4 Permit would become over inclusive with respect to what is considered a water quality standard. Such standards must be established in accordance with federal and state law. If this process has not been followed for a particular requirement, it is not a "water quality standard."

A.3.a

As discussed above, this Provision erroneously states that pollutants "in stormwater discharges" from MS4s must be reduced to the MEP. Please see the Redline.

A.3.b

This Provision should also provide that compliance with a TMDL constitutes compliance with Provisions A.1 and A.2, for those pollutants/waterbodies subject to the TMDL.

A.4.a

The Riverside County Copermittees support an approach whereby compliance with Provisions A.1 through A.3 are achieved through a truly iterative approach, one which reflects the intent of the precedential State Water Board Order Nos. 99-05 and 2001-015. As set forth in the Redline, the Riverside County Copermittees believe that they and the other Copermittees under the Draft Permit should be considered in compliance with Provisions A.1, A.2 and A.3, as applicable, through development of the WQIP, unless the San Diego Water Board denies approval of a WQIP or amendment thereof. This ensures that the Iterative Process which is the focus of the WQIP, is utilized to provide a means to be in compliance for the Copermittees.

A.4.c

This Provision should be deleted, as is reflected in the Redline. Again, this Provision defeats the purpose of an iterative approach to compliance with the Provisions A.1 through A.3, because it allows the San Diego Water Board to enforce any provision of the Draft Permit, including those provisions at any time. The San Diego Water Board obviously retains full ability to enforce the provisions of the Draft Permit, including with respect to the failure of the Copermittees to carry out required provisions. To short circuit the WQIP/JRMP process, however, is to defeat the entire intent of the Draft Permit.

3.3 Provision B, Water Quality Improvement Plans

3.3.1 Overview of Key Issues

- The goals and requirements of the WQIP need to be aligned with the requirements of the CWA that were established specifically for MS4 permits, and not impose the restoration of Receiving Waters entirely upon MS4 Copermittees.
- The WQIP should focus on addressing sources of pollutants within the jurisdiction of the respective Copermittees.
- The BMP strategies identified in the WQIP should fully inform the selection and design of programs identified in the JRMP. Some minor edits were proposed in Provision B, with additional edits as warranted in Provisions D and E.

3.3.2 Comments in support of specific changes

Introductory paragraph

The introductory language implies that the WQIP should be designed to unilaterally protect, preserve, enhance, and restore water quality and Beneficial Uses in waters of the state. As noted in Section 2.3 above, MS4 Copermittees are responsible only for discharges from their MS4s, not the unilateral protection of Beneficial Uses within their watersheds.

Redline edits were provided to:

- Tie the goals of the WQIP to the requirements of the CWA applicable to MS4 Permits.
- Replace 'waters of the state' with 'Receiving Waters' to be consistent with federal law.
- Clarify the linkage between Provision A and Provision B.

Additionally, Redline edits were provided to clarify that the strategies identified in the WQIP are intended to guide the specific actions that will be implemented by the Copermittees pursuant to Provision E.

B.1

The Riverside Copermittees support the redlines of the San Diego County Copermittees with regard to setting forth that the WQIP for the Santa Margarita Watershed Management Area (WMA) would commence upon enrollment of the Riverside County Copermittees into the Order.

B.2.e.

Two changes have been proposed, as shown in the Redline:

- The introductory paragraph includes language that clarifies that the Numeric Goals are not enforceable compliance standards, effluent limitations, or Receiving Water limitations. This clarification is consistent with San Diego Water Board staffs' verbally stated intent.
- Provision B.2.e.(1) as written requires that the final Numeric Goals be "capable of demonstrating the achievement of the restoration and/or protection of water quality standards in Receiving Waters". As discussed in Provision 2.3 above, meeting WQS in Receiving Waters is a goal of the overall NPDES regulatory programs under the CWA and not as a requirement to be accomplished alone by MS4 Copermittees. Redline edits have been provided to clarify that such goals are only required to be for MS4 discharges.

B.3.

In the Redline, edits were made to the introductory paragraph to ensure that the requirements are consistent with federal law. The CWA requires the 'effective prohibition' of non-stormwater discharges, not 'preventing' or 'eliminating' them.

Edits were also made to Provision B.3.a. to link the strategies more clearly to the Numeric Goals developed pursuant to Provision B.2.e, as well as to link them to the JRMP programs in Provision E.

B.5

In the Redline, edits were made to the introductory paragraph to clarify that the WQIP (and by extension the JRMP and Monitoring programs) are intended to meet the requirements of Provisions A.1, A.2, and A.3. The Tentative Order particularly excluded Provision A.1.b. (dealing with non-stormwater discharges). However, as discussed in the attached Legal Comments, the CWA requires that illegal discharges must be addressed via a program (as included in Provision E.2), and it is appropriate that the program be guided by the priorities and strategies included in the WQIP.

Other edits were made to clearly link Provision B.5 to the applicable requirements of Provision F.

3.4 Provision C, Action Levels

3.4.1 Overview of Key Issues

- The Action Levels (non-stormwater, and stormwater) applicable within each watershed should only be those that are associated with the priority water quality conditions in that watershed, or that are 303(d) listed for that watershed. For example, if Zinc is not a priority pollutant for a watershed, and is not 303(d) listed, there should not be a Zinc action level. This change is needed because Provision D requires analysis for all 'action level' parameters. Analysis for pollutants that are not a priority for a watershed is a waste of Copermittee resources.
- The Copermittees should be able to establish alternative action levels that are appropriate to the WMA within their WQIP. Such alternative action levels would be subject to Executive Officer approval as part of the WQIP approval process.
- Footnote 8 and 10 need to clarify that the NALs and SALs are not enforceable limitations.
- Various references to 'waters of the state' need to be changed to Receiving Waters for consistency with the Draft Order and the CWA.

Please see the Redline for further detailed comments and language changes.

3.5 Provision D, Monitoring and Assessment

The Riverside County Copermittees appreciate the changes in the monitoring program reflected in the Draft Permit, as compared to the Administrative Draft. However, elements of the revised requirements are still infeasible for the Riverside County Copermittees. The comments below identify modifications of areas of the monitoring requirement's which can significantly improve the Copermittees' ability to implement and comply with the requirements, while still maintaining appropriate jurisdictional accountability and assessment requirements to guide the implementation of the WQIPs and JRMP programs. The Redline provides further detailed comments and language changes.

3.5.1 Overview of Key Issues

- Dry Weather MS4 Outfall Monitoring
  - The level of effort dedicated to monitoring and addressing outfalls with non-stormwater discharges should be commensurate with the potential impact that discharge has on a Receiving Water. If a discharge, whether persistent or transient, has no or little potential for impacting a flowing Receiving Water, (e.g. due to infiltration, evaporation, or treatment of the flows), the outfall should be de-emphasized relative to other outfalls that have discharges that have connectivity to a flowing Receiving Water.
  - Outfall Dry Weather Field Screening – As currently drafted, the number of required visual inspections of outfalls during dry weather required per Provision D.2.a.(2)(a) and Provision D.2.b.(1) is both excessive and disproportionate. This will particularly impact smaller jurisdictions, which may be required to do more visual inspections of MS4 outfalls than would larger jurisdictions with more outfalls and more resources.
  - Similarly, as written, the Persistent Flow Outfall Monitoring requirements of Provision D.2.b.(2)(b) are excessive and also will disproportionately impact smaller jurisdictions.

Jurisdictions with several hundred outfalls will likely have significantly more resources to perform the required monitoring than smaller jurisdictions with fewer outfalls, yet both are required to implement the same level of persistent flow monitoring.

- Assessment Requirements
  - The assessment requirements require modeled extrapolation of monitored outfall data to non-monitored outfalls for the purposes of calculating loads from each outfall in each jurisdiction. Such extrapolations though modeling or other calculations will not accurately reflect actual jurisdictional loads, and have no benefit that directly analyzing the monitored data cannot more accurately provide.

3.5.2 Other Global Issues

- As currently drafted, MS4s operated by a flood control district within a city or county would be effectively double-counted for identification of outfalls in each jurisdiction and for performance of the load calculations from each jurisdiction. Additionally, Flood Control Districts have no land use or enforcement authorities outside of the MS4 and rely on the local Copermittee to address pollutant sources and discharges to their MS4. Redline edits have been included to clarify the relationship between districts and the municipal jurisdictions they serve for the purposes of outfall monitoring and the assessment requirements.
- Timelines for monitoring and assessments were clarified throughout and linked to specific reporting requirements of Provision F in the Redline.

3.5.3 Comments in support of specific changes

D.1.a.(3) and D.1.e.

The Redline clarifies that the Receiving Water monitoring described in these sections must be conducted as applicable to the WMA and the Copermittees' MS4 discharges, because some of the monitoring requirements only apply to MS4 discharges to certain waterbodies. Not all Copermittees within a WMA will have discharges to that waterbody.

D.1.b.

The Redline proposes language to allow for alternative long-term monitoring stations to be identified. Using the SMR as an example, the Copermittees might wish to utilize a location other than the existing stations due to the influence of groundwater during dry weather and/or the general lack of MS4 contributions in dry weather to those locations.

Table D-1 and D-6

The Redline proposes an addition to the list of field observations, an assessment for flow connectivity of any MS4 discharges to the sampled Receiving Water. It is important to know whether the sampled Receiving Water included a contribution of flows from MS4 discharges, or whether the data reflect conditions in the absence of an apparent MS4 discharge contribution.

D.2.a.(2)

The Redline clarifies that the identification of annual outfall monitoring requirements is based on municipal Copermittee boundaries, inclusive of Flood Control District MS4 outfalls within their jurisdiction.

The Redline clarifies that the field screening requirements apply to those outfalls in the Copermittee's inventory that are 'accessible'. If an outfall is inaccessible for safety reasons or due to habitat restrictions, it would not need to be field screened.

The Redline simplifies the 'tiers' in Provision D.2.a.(2)(a) by removing the lower tier (i), and expanding the second tier (ii) to cover all Copermittees with 500 or less outfalls. This resolves the disproportionality that occurs for Copermittees with a number of outfalls near the current 125 outfall threshold. For example, as currently drafted, a city with 150 outfalls would be required to do 150 visual inspections per year, but a smaller city with 120 outfalls would be required to do 192 visual inspections per year. The Redline also maintains the 80% requirement from the first tier to help smaller Copermittees manage their workload for meeting the field screening requirements while also conducting the additional source identifications that are required under the Draft Permit.

The Redline includes edits to Footnote 19 to clarify that persistent flow should effectively be a discharge that is hydraulically connected to a flowing Receiving Water. Any other discharges that are not affecting a flowing Receiving Water (such as pooled or ponded water) would be addressed as a Transient Discharge, with source IDs any time an obvious illegal discharge (i.e. color or odor) is identified.

D.2.a.(3)

The Redline incorporates edits proposed by the San Diego County Copermittees to require 10% of the samples in each WMA to be from a first storm event. As described in the comments of the San Diego County Copermittees, this will help avoid overly skewing of the data to 'first flush' data, while still incorporating such data into the data and analyses.

D.2.b.(1)

The Redline removes the requirement that the number of visual inspections performed be equivalent to the number of inspections required under Provision D.2.a.(2)(a).

As areas within a jurisdiction are confirmed not to have non-stormwater discharges, inspections of other outfalls would have to be perpetually (and unnecessarily) increased to maintain compliance with this requirement. For example, if a Copermittee had 150 outfalls, but after the transitional period it confirmed that 100 of those outfalls had no evidence of non-stormwater discharges to flowing Receiving Waters, it would have to visit the remaining 50 outfalls for up to three times a year to meet the requirement in this Provision. As the Copermittee got closer to eliminating non-stormwater flows at more outfalls, inspections at the remaining outfalls would quickly become excessive and unreasonable. Removing this requirement will better incentivize the elimination of non-stormwater flows, as a Copermittee can look forward to reducing its workload in areas confirmed to not have non-stormwater flows.

D.2.b.(2)(b)

While the Riverside County Copermittees support the San Diego County Copermittees' proposal to reduce the number of required outfalls from 10 to 5 persistently flowing outfalls per WMA, the Riverside County Copermittees believe that applying the same minimum bar to all Copermittees is inappropriate and disproportionately affects smaller Copermittees that have commensurately less staff and resources.

The Riverside County Copermittees propose requiring monitoring of the top 10% of the prioritized persistent flow outfalls, with a lower and upper limit of 1 and 5 respectively, as shown in the redlines. With this change, the level of effort required of any individual Copermittee would scale consistent with the number of persistent flow outfalls within each Copermittees' jurisdiction.

Additionally, the Riverside County Copermittees request changing the requirement of Provision D.2.b.(2)(b)(ii) to require annual monitoring rather than semi-annual monitoring. With this change, a Copermittee could focus more of their annual budget on conduction Source ID efforts – which can result in eliminating problematic non-stormwater flows, rather than on a second monitoring event. Copermittees would still have the option to conduct a second monitoring event if they have more resources available and want to remove the outfall from their monitoring list sooner in accordance with Sub-Provisions [a] through [d].

D.2.b.(2)(e)

The Riverside County Copermittees support the San Diego County Copermittees' comments regarding allowing for a tailored list of constituents to be developed for each WMA. The Redline incorporates those edits.

D.3.

The Riverside County Copermittees support the changes recommended by the San Diego County Copermittees to this section, and these changes are reflected in the Redline.

D.4.a.(2)

This Provision as drafted would require the MS4 Copermittees to make comprehensive evaluations of Beneficial Uses that are beyond their expertise or the scope of an MS4 permit. Such evaluations and determinations would require advanced studies and cannot be answered with the monitoring data collected through this permit. This Provision should either be deleted or, alternatively the Riverside County Copermittees request that the assessments be focused on determining the status and progress toward addressing any Numeric Goals established for those Receiving Waters in the WQIP. Please see the Redline.

D.4.b.(1)

The Redline clarifies that outfall assessments are to be done for the area covered by each Municipal Copermittee (consistent with the proposed definition), and that the data to be used by each Municipal Copermittee would include the data collected from any Flood Control District Copermittee operated MS4s within its jurisdiction. This ensures that jurisdictional data is not double reported for Flood Control District MS4s within a city or county.

For Sub-Provision D.4.b.(1)(c)(iv) three key changes are requested in the Redline:

1) Annual volumes and pollutant loads should only be calculated from the monitored outfalls with persistent discharge to a flowing Receiving Water. This is directly applicable to the purpose of the Draft Permit and an important change, because volume and pollutant data extrapolated to non-monitored MS4 outfalls would be inaccurate and potentially misused if taken out of context. It is understood that San Diego Water Board staff want to ensure that jurisdictional accountability is maintained. However, since MS4 outfall monitoring will be conducted within each jurisdiction, inter-jurisdiction comparisons and accountability can be accomplished using the monitoring data directly without such extrapolations.
2) Added language to require a Copermittee to include in its jurisdictional load calculations any discharge that was demonstrated to have entered another Copermittees' MS4 before being discharged into the flowing Receiving Waters. This is important to ensure that each Copermittee maintains accountability for pollutants discharged to flowing Receiving Waters from within its jurisdiction.
3) The Redline proposes that the calculations of pollutant loads be only for the priority water quality constituents identified in the WQIP.

D.4.b.(2)(b)

Two key changes are recommended in the Redline:

1) Annual volumes and pollutant loads should only be calculated from the monitored outfalls for the monitored storm events. This is an important change because volume and pollutant data extrapolated to non-monitored events would be inaccurate and potentially misused if taken out of context. It is understood that San Diego Water Board staff want to ensure that jurisdictional accountability is maintained, so the Redline proposes that data from the monitored outfalls be extrapolated to identify loads for each jurisdiction during each monitored event. With this information, inter-jurisdiction comparisons and the desired 'accountability' can be accomplished using the monitoring data directly without such extrapolations to non-monitored events.
2) The Redline requests that calculations of pollutant loads be performed only for the priority water quality constituents identified in the WQIP.

D.4.b.(2)(c)

The Redline edits are consistent with those proposed by the San Diego County Copermittees, with minor modifications for clarity.

D.4.d.(2)(c)

It would be difficult to proactively determine the pollutant load reductions that *would* be necessary to demonstrate that discharges *are not* causing or contributing to exceedances of Receiving Water Limitations. Instead it would make more sense to calculate the necessary pollutant load reductions where the discharge has been demonstrated to be causing or contributing to such exceedances. In such circumstances, the necessary parameters would be known to calculate the needed load reduction. These changes are set forth in the Redline.

3.6 Provision E.1, Legal Authority

3.6.1 Overview of Key Issues

The Riverside County Copermittees note that Provision E.1, relating to the establishment of adequately legal authority, exceeds the requirements of federal CWA regulations in several respects. The federal regulations at 40 CFR 122.26(d)(2)(i)(A)-(F), provide explicit guidance for the Copermittees in developing the necessary legal authority to control MS4 discharges within its jurisdiction. However, several of the subsections of Provision E.1 go beyond these federal requirements, with respect to areas not within the responsibility of MS4 dischargers, such as negotiating with non-Copermittee entities. The Riverside County Copermittees have provided requested changes in the Redline, which are explained briefly below.

3.6.2 Comments in support of specific changes

E.1.a(1)

Changes in the Redline to accurately reflect the language of 40 CFR 122.26(d)(2)(i)(B).

E.1.a(2)

Changes in the Redline to accurately reflect the language of 40 CFR 122.26(d)(2)(i)(A). In addition, the Provision as written improperly requires the Copermittees to control the quality of runoff from sites covered by the state general permits for industrial activity and construction. These general permits are enforced by the State Board and the regional boards, and it is a state responsibility which cannot be handed off to the Municipal Copermittees.

E.1.a(3)

Changes in the Redline to accurately reflect the language of 40 CFR 122.26(d)(2)(i)(C).

E.1.a(5)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations. The Provision also improperly requests the Municipal Copermittees to attempt to negotiate with third parties the contribution of pollutants to the Copermittees' MS4. The Copermittees have no jurisdiction over such parties. The San Diego Water

Board has such jurisdiction, and should take responsibility for addressing non-MS4 sources of pollutants that may ultimately enter the MS4.

E.1.a(6)

Changes in the Redline to reflect accurately the language of 40 CFR 122.26(d)(2)(i)(E).

E.1.a(7)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations.

E.1.a(8)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations.

E.1.a(9)

The Redline requests deletion of this Provision, which is not a requirement for municipal stormwater dischargers set forth in the CWA regulations.

E.1.a(10)

The Redline requests both correction of the language in this Provision to comport with the federal regulations in 40 CFR 122.26(d)(2)(i)(F) and deletion of the second clause of this Provision, which is not found in 40 CFR 122.26(d)(2)(i)(F). Moreover, the requirement to inspect and monitor in the first clause of this Provision covers the issues set forth in the second clause. It is therefore unnecessary.

3.7 Provision E.2, IDDE

3.7.1 Overview of Key Issues

- The Draft Permit requires the Copermittees to address all non-stormwater discharges from the MS4 as illegal discharges, and then describes certain sources that need not be prohibited. This is effectively a 'guilty until proven innocent' provision, where a Copermittee will be required to expend potentially significant resources conducting source identification efforts any time non-stormwater is observed discharging from the MS4. In addition to the issues discussed in the Legal Comments, the Provision raises two practical and logistical problems:
    - This requirement is entirely independent of the determination that there are in fact any significant pollutants in such a discharge. A Copermittee could be spending substantial sums tracking (and then potentially enforcing upon) the source of a discharge that is not negatively impacting Receiving Waters. This not only is a waste of public resources, but would undermine the credibility of stormwater programs.
    - The San Diego Water Board and the State Water Board do not treat non-stormwater flows in the same manner across all of their regulatory mechanisms. For example, Order

No. R9-2008-0002 allows non-stormwater discharges to occur, POTWs are issued permits for their discharges and agricultural operators can discharge irrigation water. The Copermittees should not be forced to conduct an expensive source investigation, only to find that the discharge complies with a permit or a waiver granted by the Water Board. The Copermittee would have no ability to address such a discharge as an 'illegal discharge', and further would have no ability to recuperate their costs for the source identification.

The best way to address these issues, is to require the Copermittee to have and enforce an effective prohibition of illegal discharges of *pollutants* (through statutes, ordinances, permits, contracts, orders or similar means), and then allow the Copermittee full discretion to determine which non-stormwater discharges have the potential to negatively impact Receiving Waters, consistent with the WQIP priorities – and address those as illegal discharges.

- Several categories of non-stormwater discharge that were previously conditionally exempt consistent with the CWA, are required by the Draft Permit to be treated as illegal discharges, unless they have coverage under another order issued by the San Diego Water Board. In addition to the problems identified above for conducting enforcement in the absence of a pollutant discharge, the San Diego Water Board, not the Copermittees, is responsible for evaluating coverage, need for coverage, and compliance with other orders issued by the Water Board. The Copermittees have neither authority nor jurisdiction. Please see the Redline.
- Several categories of non-stormwater discharge that were previously conditionally exempt consistent with the CWA, are required by the draft permit to be 'controlled' or otherwise prohibited by the Copermittees. The Fact Sheet further describes that such controls are warranted because they could potentially contain pollutants. However, the CWA only requires controls where the discharges are determined to be a significant source of pollutants. Please see Legal Comments for a further discussion of this issue as well as the Redline.
- The Draft Permit eliminates the conditional exemptions for Landscape Irrigation, Irrigation Water, and Lawn Watering (collectively 'irrigation runoff'). The San Diego Water Board has provided no data demonstrating that these discharge categories have contributed a significant pollutant load to Receiving Waters within Riverside County. Information discussed in the Fact Ssheet focuses on data from other counties. The only data from Riverside County is public educational material referring to irrigation runoff; this material, however, was adapted from public education material from other counties. That public educational material was intended to help prevent such discharges from becoming a significant source of impact on the Receiving Waters, and did not constitute a determination that such discharges are in fact, actually a significant source that needs to be subject to a prohibition. See the discussion in the Legal Comments as well as the Redline.
- The Draft Permit, in Provision E.2.a.(7) requires efforts to minimize or eliminate all non-stormwater flows, including those that are natural, conditionally exempt, or otherwise permitted by the San Diego Water Board, regardless of whether or not such discharges are not contributing pollutants to the MS4. Such a requirement conflicts with the prior Provisions E.2.a.(1) through

(5), which state conditions where such discharges need not be prohibited. The requirement should therefore be removed, as set forth in the Redline.

3.7.2 Comments in support of specific changes

E.2.a.(1) and (3)

The Riverside County Copermittees request that this Provision be deleted (as shown in the Redline) and the categories of non-stormwater discharges be re-incorporated into Provision E.2.a.(3). The apparent premise of Provision E.2.a(1) as drafted is that since the San Diego Water Board requires those discharges to have coverage under a separate order, they are illegal if they lack such coverage. The MS4 Copermittees, however, are not responsible for enforcing discharge coverage under separate San Diego Water Board orders; that is the responsibility of the San Diego Water Board itself. Requiring the Copermittees to enforce such entities for their lack of coverage under a separate San Diego Order shifts that responsibility from the Board to Copermittees. This is not authorized by the CWA or the Porter-Cologne Water Quality Act. The Copermittees are, under the CWA, only required to address such discharges as illegal discharges if the discharge is found to be contributing a significant pollutant load to the MS4. By moving those categories to Provision E.2.a.(3), as shown in the Redline, the Copermittees will still be required to treat such discharges as illegal discharges if and when they are found to be contributing significant pollutants to the MS4. This proposed approach is consistent with other MS4 permits in the state, including prior San Diego Water Board orders, and is further consistent with the approach taken for the WQIP, which is intended to allow the Copermittees to focus resources on addressing the specific impacts that MS4 discharges are having on Receiving Water quality.

E.2.a.(2)

This Provision requires the Copermittees to treat water line breaks as illegal discharges, which in turn requires the Copermittee to conduct enforcement measures. Water main breaks are accidental occurrences, or may be the result of acts of nature. It is no more appropriate to treat accidents as illegal and subject to enforcement than it would be for a city to declare vehicular accidents as illegal, and conduct enforcement against those involved. This language needs to be removed as shown in the Redline. Additionally, as discussed in the Legal Comments, a recent case from the federal district court in Virginia suggests that the regulation of mere flow may exceed the authority of the CWA.

E.2.a.(4)

The Redline clarifies that if the 'statues, ordinances, permits, contracts, orders or similar means' are enacted/adopted by a Copermittee, the categories of non-stormwater discharges listed do not need to be treated as illegal discharges. Otherwise, the language could be read to imply that, for example, if it was infeasible for a particular resident to direct wash water to landscaped areas, that the Copermittee would be required to treat that residents' discharge as illegal and enforce upon them.

E.2.a.(5)

Contrary to the provisions of the CWA regulations, prior MS4 permits issued by the San Diego Water Board and other permits in the state, the Draft Permit requires implementation of BMPs, where feasible, during emergency firefighting activities. During such emergencies, all focus of public resources must appropriately be dedicated to protecting life and property. Any diversions from that mission would only serve to diminish and potentially compromise that mission. The Redline proposes language consistent with that adopted by the San Diego Water Board in 2010 for the Riverside County MS4 Permit (Order R9-2010-0016).

E.2.a.(7)

Provisions E.2.a.(1) through E.2.a.(6) describe circumstances where non-stormwater discharges need not be prohibited. This Provision then requires the Copermittees to minimize such 'conditionally allowed' flows anyway. This requirement exceeds the scope of the CWA and its implementing regulations and makes no sense. The Redline requests deletion of these Provisions.

E.2.b.(1)(d)

This Provision requires the MS4 Copermittees to map all known private outfalls to Receiving Waters. Such a requirement is beyond the scope of an MS4 permit and should be removed, as shown in the Redline. The Draft Permit does not require a Copermittee to address private outfalls to Receiving Waters; this is the responsibility of the San Diego Water Board, which governs all waste dischargers under the authority of the CWA or the Porter-Cologne Act.

E.2.b.(4)

This Provision requires the Copermittees, in conjunction with a spill, to 'prevent contamination of surface water, groundwater, and soil.'This requirement is clearly beyond the scope of an MS4 permit issued under the CWA (which regulates only discharges of water containing pollutants *from* the MS4 to Receiving Waters) and must be removed, as shown in the Redline. The Draft Permit could more appropriately require the Copermittees to 'coordinate, to the extent possible, with spill response teams to prevent entry of spills into the MS4.'

E.2.d.(2)(e)

The Redline requests edits to clarify that the intent of this Provision is to document and attempt to quantify any obvious sources of non-stormwater illegal discharges in response to the outfall monitoring, and that it is not necessary to conduct a full source identification any time there is evidence of water near an outfall.

New Provisions E.2.d.(3)(e)-(f)

The Redline adds two new provisions to this section to address a gap in potential outcomes from a source identification effort. These Provisions address scenarios where a Copermittee identifies A) the illegal discharge is coming from another upstream Copermittees' MS4, or B) that the discharge has been authorized by the San Diego Water Board, either through an order or waiver of WDRs. In the first scenario, the responsibility to continue the source identification, and conduct enforcement, would be transferred to the upstream Copermittee. In the second scenario, the responsibility for follow-up would fall on the San Diego Water Board, after receiving relevant information from the Copermittee. This Provision also provides for reimbursement to the Copermittee for the cost of the source identification, since the San Diego Water Board required the Copermittee to conduct the investigation, while not commensurately prohibiting all non-storm water discharges from all other sources regulated by the Water Boards.

3.8 Provision E.3, Development Planning

3.8.1 Overview of Key Issues

- Priority Development Projects - The Tentative Order identifies categories of projects that are to be defined as 'Priority Development Projects' (PDPs), which in turn will be required to comply with specific water quality and Hydromodification mitigation and quantitative requirements. The criteria for PDPs is quite broad and would include the majority of development projects, from small convenience stores and residences, to mega malls and specific plan developments. The Fact Sheet describes that while some smaller project types may not have significant pollutant loads, they may have a hydrologic impact upon Receiving Waters. However, it is important to recognize that pursuant to Provision E.3.a., All projects are required to implement a variety of LID principles such as disconnecting impervious surfaces, draining impervious surfaces to landscaped areas, and minimization of soil compaction in landscaped areas. Since such LID principles will be implemented wherever feasible consistent with the MEP standard, these smaller development projects are unlikely to create a pollutant or hydrologic impact. Additionally, the Fact Sheet advocates incentivizing LID design concepts and green infrastructure and building principles. Accordingly, the Redline requests changes to Provision E.3.b.(3) as described in Provision 3.8.2 below. The Legal Comments further note the potential impact of the Virginia case (*Virginia Dept. of Transp. v. U.S. Environmental Protection* Agency) holding that the CWA does not regulate stormwater as a pollutant.
- Design Capture Volume – There are two problems with how the Draft Permit defines the Design Capture Volume:
    - The Draft Permit changes the 'design capture volume' from previous permits by eliminating the term 'runoff'. Prior permits described that the design capture volume is the volume of stormwater runoff from the 24-hour 85th percentile storm event. This permit changes that to be the volume of stormwater produced from a 24-hour 85th percentile storm event. The elimination of the term 'runoff' means that BMPs would need to be sized potentially much larger than previously. For example, if the 85th percentile storm is 1" and a BMP is designed to treat 1 acre of residential land with a coefficient of runoff of 0.6, then under the current permits the BMP must be sized to hold 2,178 cubic feet of water. However, under the language of the Draft Permit, the BMP treating the same area would be required to hold 3,630 cubic feet of water, a 70% increase in BMP size. Accordingly, the Redline restores the term 'runoff'.
    - Additionally, the Draft Permit defines the Design Capture Volume alternatively as: *"the volume of storm water that would be retained onsite if the site was fully undeveloped and naturally vegetated, as determined using continuous simulation modeling techniques based on site-specific soil conditions and typical native vegetative cover."* In addition, to the problem identified above regarding the volume of storm water runoff, this language does not provide a temporal standard for determining which volume to

calculate from a continuous simulation model. Additionally, such models are not commonly used among general practitioners in the civil engineering community. The Redlines propose an alternative and simpler approach for this second definition: "The volume of stormwater runoff produced from a 24-hour 85th percentile storm event, that would be retained onsite in the pre-project condition." This definition is advantageous for several reasons: 1) it is simple for any civil engineer to understand, calculate, and comply with and is based on the same storm and hydrologic calculations as the first option, 2) it respects natural hydrology for the site, which may have had runoff in the pre-project condition, and as such, is more compatible with the intent of LID to mimic natural hydrology, and 3) as a result it is less likely to result in potential degradation of Beneficial Uses downstream, from reductions in flows beyond the pre-project condition.

- Pre-Project vs Pre-Development – Both the Storm Water Pollutant Control BMP requirements and the Hydromodification Management BMP requirements in the Draft Permit specify a 'pre-development' condition as the mitigation standard for all PDPs. In addition to the legal problems with such a standard as set forth in the Legal Comments, there are practical problems with the standard.
    - The presumption made in the discussions in the Fact Sheet are that all Receiving Waters can, and will, be restored to a fully natural condition - effectively to a natural floodplain. This presumption does not address reality, which is that development has occurred in those floodplains over many generations. The San Diego Water Board obviously lacks the authority to force homeowners and businesses to vacate such floodplains to effectuate restored natural conditions. Such an action would represent an unconstitutional taking. Moreover, the Legislature, in the Flood Control Acts covering all three counties proposed to be covered by the Draft Permit, has specifically authorized Flood Control Districts to construct flood control structures required to protect the lives and properties of the citizens.
    - Mitigation to a pre-development condition also may not be necessary to protect Receiving Waters from the effects of Hydromodification. If, for example a Receiving Water with existing development tributary to it, has not experienced increased erosion due to that existing development, there is no reason to require Hydromodification mitigation to anything more than the existing condition. In the counter-example, if under the existing condition the Receiving Water has experienced increased erosion due to that existing development, then, legal issues aside, there would be technical benefit to mitigating to that pre-development condition.

  The Redline proposes alternative language that requires mitigation to a pre-development standard only where it is legal and technically justified based on the conditions of the Receiving Water.

- Alternative Compliance – The alternative compliance project options as set forth in the Draft Permit pose two key problems:

- Several statements are conflicting and thus confusing as to what the required standard is for the various alternative compliance projects. For example, throughout Provision E.3.c. it is stated that 'a PDP may be allowed to comply with Provision E.3.c.(1)(a) and/or Provision E.3.c.(2) if they …'. This language can be mis-read to imply that the project must comply both with Provisions E.3.c.(1)(a) and E.3.c.(2) *and* implement the alternative compliance project (thus negating the benefit of alternative compliance). The Redline clarifies this language.
- The Biofiltration option set forth in the Draft Permit arbitrarily, and without technical basis or justification, **doubles** the sizing standard for biofiltration BMPs from 0.75 times the design capture volume (as set forth in the 2010 MS4 Permit and the 2009 Orange County Permit) to 1.5 times the design capture volume. The existing 0.75 standard was set due to the fact that 1) the 85^{th} percentile 24-hour storm occurs over a period of time, and 2) such BMPs have outflows and will regain some capacity during the storm event, and as such, do not need to instantaneously hold the entire 'Design Capture Volume' to have fully treated that volume. In fact, studies have shown that in addition to yielding excellent pollutant concentration reductions, LID Biofiltration BMPs are excellent at reducing the volume of runoff similar to retention BMPs. According to the ASCE International BMP database 60% or more of the long-term volume of runoff from a site can be retained within a Bioretention BMP (Bioretention BMPs are the primary 'biofiltration' BMP now allowed in Riverside County). In comparison, a Retention BMP sized to hold the runoff from the 85^{th} percentile storm event (the Design Capture Volume) will end up retaining approximately 80% of the long-term volume of runoff. Thus, by simple proportions, a Bioretention BMP sized to 'hold' 100% of the Design Capture Volume may also be able to retain 80% of the long-term volume of runoff. $\left(\frac{0.75 \times DCV}{60\%\ retained} = \frac{1.0 \times DCV}{80\%\ retained}\right)$. This is being validated through Bioretention BMPs that have been constructed and are being monitored for such volume reductions at the Riverside County Flood Control District's headquarters in Riverside. Further, Biofiltration BMPs have the added benefit of providing better overall treatment of back to back storms. Where a Retention BMP would be full after the first storm, fully bypassing the second storm without treatment, a Biofiltration BMP will have restored some capacity after the first storm, providing for treatment of some or all of the second of the back to back storms. Thus, the attached redlines propose changing the sizing factor for Biofiltration BMPs to 1.0 times the Design Capture Volume. The Redline proposes changes consistent with these comments.

3.8.2 Comments in support of specific changes

Introduction

Provision E.3.g (Strategies to address the highest priority water quality conditions) was moved to the beginning to support and better integrate the development planning programs in the JRMP with the strategies developed in the WQIP.

E.3.a.(3)

The Redline changes the title of this section (and other appropriate references to this Provision) to refer to LID Principles, as identified in the CASQA LID Manual for Southern California (https://www.casqa.org/LIDDemo/LowImpactDevelopmentManual/tabid/242/Default.aspx)

E.3.b.(1)(c) (New Provision)

This Provision was added to clarify the requirements if a project that was already subjected to SSMP requirements redevelops a portion of the site.

E.3.b.(2)

The Redline edits shown for this Provision are primarily to simplify this Provision, by grouping various categories by their applicable square footage threshold and including some of the specifics in the definitions (Attachment C). Other changes (beyond reorganization) include:

- Removing the addition of 'driveways' from subsection (g) as described in Provision 3.8.1 of this letter.
- Adding a footnote for parking lots, to clarify that the trigger would not include parking lots that are not exposed to runoff, such as subterranean or covered parking lots. It is beneficial to not have parking lots exposed to runoff; excluding such parking lots from being defined as a PDP is a good way to encourage such practices.
- Hillside development projects were not included as it is not believed to be necessary anymore with the relatively low threshold (10,000 square feet) identified for other categories included in this and other recent MS4 permits.
- The definition for "Environmentally Sensitive Areas" from existing MS4 permits was restored to include the language referring to discharges that are not commingled with flows from adjacent or other upstream lands (note that the change is shown in the definitions per the re-organization suggested above).

E.3.b.(3)

- The PDP exemption for sidewalks, bicycle lanes, or trails, [E.3.b.(3)(a)] has been expanded to as shown in the Redline to include driveways and parking lots. If those projects implement criteria already described in that section, they are also unlikely to create an impact to Receiving Waters. Further, including those project types in that exemption will further incentivize developers to utilize those LID Principles.
- The exemption described in Provision E.3.b(3)(b), was modified as shown in the Redline, and as discussed in the comment letter submitted by the Riverside County Transportation Department. Please see that letter for a justification for the requested changes.
- As shown in the Redline, the exemptions for new and redeveloped single family residences [E.3.b.(3)(c) and (d)] were consolidated into a new provision [E.3.b.(3)(c)], covering all single family residential projects (both new and redeveloped). The key difference is that such projects would be considered exempt if they are both 1) not part of a larger common plan of development or planned subdivision, and 2) successfully incorporate each of the applicable source control and LID Principles identified in Provision E.2.a.(2)-(3) to the MEP.

- A new Provision-E.3.b.(3)(d), titled 'Watershed Protection Projects' was added in the Redline. The project types described therein are all projects that are undertaken to rehabilitate or prevent environmental, social, and economic damage within the watershed, including Receiving Waters. These projects, while they may in some cases require some level of impervious surfaces to be constructed, are 1) not designed for human use or activity that would generate pollutants, or are designed specifically to mitigate such pollutants; and 2) will implement each of the applicable source control and LID Principles identified in Provision E.2.a.(2)-(3) to the MEP.

E.3.c.(1)

In addition to the edits discussed in Provision 3.8.1 of this letter, the Redline removed subprovision E.3.c.(1)(c) , for two reasons:

- The requirements that must be met to when implementing an alternative compliance project are more fully described in Provision E.3.c.(3).
- The language, as drafted, appeared to require double-mitigation. It requires that: 1) conventional treatment is required to treat the entire volume not retained onsite, and 2) the pollutant load discharged must also be mitigated with an alternative compliance project. Such a scenario would be requiring double-mitigation. The Redline provides a clearer and more simple mitigation standard.

E.3.c.(2)

The Riverside County Copermittees have two concerns with this Provision:

- The first concern is the universal requirement to mitigate to the 'pre-development' standard, as discussed above in section 3.8.1 of this letter. The Copermittees in the Redline propose that this language be changed to the 'pre-project' condition. For new development projects, the 'pre-project' condition will be equivalent to the 'pre-development' condition. For redevelopment projects, the standard would be the conditions that exist onsite prior to the construction of the project. This is appropriate, because in many areas, particularly in areas of existing development that would be subject to 'redevelopment', Receiving Waters are engineered and maintained to 1) provide flood protection for the public, 2) ensure that floodwaters don't comingle with pollutants on adjacent private properties and 3) to ensure that the existing development draining to that system does not cause erosion. In cases where the Receiving Waters are not engineered and maintained, and erosion problems caused by existing development are observed, language has been added to the Redline to provide for additional standards to be developed in the WQIP, based on the WQIP priorities.
- Additionally, the Redline proposes an additional exemption from HMP requirements for projects that discharge into conveyance channels that are engineered and maintained for the build-out condition all the way from the project to a waterbody that is sufficiently resistant to Hydromodification. This language is consistent with the above discussions, and ensures the PDPs are not required to mitigate for non-existent impacts. Please see the specific language in the Redline. The engineered channel exemption can be found in other recent MS4 permits, including the recently adopted Los Angeles County MS4 Permit.

E.3.c.(3)(a) and (b)

These two Provisions were re-written in the Redline to be simpler and clearer on what BMPs, criteria, sizing standards are required for what type of project. This alternative language still meets the intent of the Draft Permit, while being easier to understand and comply with. Aside from simplifying the language, the following other changes were made in the Redline:

- The alternative compliance options must be determined to provide an equal or greater overall water quality benefit for the WMA.
- Additional options were provided for who can design the alternative compliance projects
- All alternative compliance projects are required to be consistent with the strategies in the WQIP. While the specific alternative compliance project would not be required to be identified in the WQIP, the goal of this language is to ensure that allowing the alternative compliance project would not in any way be detrimental to or contrary to the strategies in the WQIP.
- Requirements E.3.c.(3)(a)(iv) and (v) were removed entirely, as they conflict with E.3.c.(3)(a)(iii) which allowed the projects to be in the same WMA (preferably the same HSA)
- Changed the sizing factor for Biofiltration BMPs to 1.0 as discussed in section 3.8.1 of this letter, and deleted the option [d] which required triple mitigation by requiring Biofiltration + Conventional Treatment + Alternative Compliance projects.
- Added Conventional Treatment Control BMPs as an alternative compliance option, only where it has been shown to be technically infeasible to meet E.3.c.(1) and technically infeasible to implement LID Biofiltration Treatment Control BMPs.

E.3.c.(3)(c)

Redline edits in this section are primarily to simplify and consolidate the requirements. Sub-Provision [C] was removed, as it was duplicative of the mitigation standards for the alternative compliance project are specified in E.3.c.(3)(b) and E.3.c.(3)(c)(i)[a].

3.9 Provision E.4, Construction

3.9.1 Overview of Key Issues

This Riverside County Copermittees' comments and edits are set forth in the Redline.

- One key issue for the Copermittees is the edit shown in the Redline to Provision E.4.c, which clarifies that the Copermittees are responsible for *requiring* BMPs at private construction sites, and *implementing* BMPs at Copermittee construction sites.

3.9.2 Comments in support of specific changes

The Redline edits include comments supporting the requested edits.

3.10 Provision E.5., Existing Development

3.10.1 Overview of Key Issues

The Draft Permit includes requirements for advanced programs to identify opportunities and implement programs to facilitate the construction of Retrofit and Stream/Channel/Habitat Rehabilitation projects on private properties. Such requirements are clearly beyond the requirements of the CWA for a management plan to be implemented by an MS4 Copermittee. The Riverside County Copermittees request deletion of these requirements.

Alternatively, the Riverside County Copermittees have the following comments:

While these retrofitting and rehabilitation approaches can be helpful and/or needed in some circumstances, they are not required in all circumstances, nor are required to address all pollutants that may be identified in a WQIP as the highest priority water quality conditions. For example, some pollutants are best addressed with regulatory source controls at the state or federal level, such as the removal of copper from brake pads, and controls on pesticides, while other pollutants can be adequately addressed through inspections and enforcement. There are several problems with requiring Copermittee resources to be invested in such Retrofit and/or Rehabilitation strategies (collectively referred to as 'retrofit'):

- Land Ownership: The land that could potentially be identified for retrofit would likely not be owned by a Copermittee. The Copermittee therefore has no ability to force the property owner to retrofit their property. Although the Copermittee could potentially implement programs to "facilitate" implementation, such a program would still be limited by the rights of the individual property owner. Even if a Copermittee were to attempt to purchase a privately owned existing development for the purposes of retrofit (a step going far beyond any requirements in the CWA or the Porter-Cologne Act), such a process can take many years, and if the owner is unwilling to sell, the retrofit project could never be realized. In any scenario, the process to facilitate such "retrofits" is extremely costly and lengthy, with no guarantee of a benefit to water quality. Retrofits should only be undertaken where the Copermittee identifies it as a necessary step to addressing the MS4 contributions to Receiving Water problems to the MEP. Otherwise, it forces the Copermittee to utilize resources very ineffectively, which is contrary to the goals of the WQIP and may actually be detrimental to water quality.
- Permitting: Aside from the limitations discussed above, stream/channel/habitat restorations have the additional complexities of requiring other regulatory permits that are not the discretion of the San Diego Water Board nor the Copermittees to issue. Such projects can take many decades to implement, and thus, are not expected to be highly effective at addressing the goals of the WQIP, except in rare circumstances.

Redline edits have been provided to clarify that these strategies and programs should only be used when, and to the extent directed by the strategies developed in the WQIP.

3.10.2 Comments in support of specific changes

E.5.b.(1)(b) and (d)

BMP implementation requirements of Provision E.5.b.(1)(b) and (d) have been clarified in the Redline to require the Copermittee to implement BMPs on their existing development, and require implementation of BMPs on private existing development.

E.5.c.(1)(a)(iv)

The Riverside County Copermittees request deletion of this Provision. The Copermittees should be provided the flexibility to schedule inspections as they see fit, provided that the schedules they establish pursuant to E.5.c.(1)(a), and the minimum frequency in E.5.c.(1)(a)(i) are met. Requiring 20% every year will be difficult to track as businesses may be opened or closed throughout the year and throughout the permit term.

Additionally, the Riverside Copermittees understand that other Copermittees may be recommending that E.5.c.(1)(a)(i) be changed to 'once per permit term'. The Riverside Copermittees believe that the current language of 'once every five years' is more appropriate for two reasons: 1) not all Copermittees (i.e. OC and Riverside) will be enrolled into the permit at the beginning of the 'permit term', and 2) not all businesses will be in existence at the beginning of the permit term. Accordingly it is more appropriate to simply require the minimum to be once every five years, that way a program manager can simply look at the last time a facility was inspected, and use that date to schedule the next inspection.

3.11 Provision E.6, Enforcement Response Plans

3.11.1 Overview of Key Issues

The Riverside County Copermittees' edits and comments are shown in the Redline and discussed below.

3.11.2 Comments in support of specific changes

E.6.d.

The terminology in this Provision was changed in the Redline from 'escalated' enforcement to 'progressive' enforcement. The proposed language better reflects the nature of enforcement actions, which are not simply 'escalated' or 'not escalated', as implied by Provision E.6.d.(2), but are progressive as needed in response to the severity of the violation. Since every violation comes with a unique set of circumstances, it is not reasonable to presume that a single set of 'triggers' will universally result in the same level of enforcement.

3.12 Provision E.7, Public Education

3.12.1 Overview of Key Issues

The Riverside County Copermittees' edits and comments are shown in the Redline.

3.13 Provision, E.8 Fiscal Analysis

3.13.1 Overview of Key Issues

The requirement that the Copermittees "must secure all the resources necessary to comply with this Order" exceeds the requirements of the CWA and illegally intrudes on the home rule authority of municipalities to govern themselves. This must be deleted. Please also see Legal Comments.

With regard to other provisions, the Riverside County Copermittees' edits and comments are shown in the Redline.

3.14 Provision F

3.14.1 Overview of Key Issues

- F.1 – WQIP Submittal
  - Based on the schedule for the initial submittal of the Priority Water Quality Conditions and Numeric Goals, and the subsequent 60-day public review, only one month would be left for the Copermittees to finalize strategies based on those conditions and goals and the public input received. This is an insufficient amount of time. The Redline requests modifications to the schedule that would provide for the submittal of the final WQIP within 24 months (instead of 18), to provide additional time for the development of strategies.
- F.1 and F.2.
  - The schedules for submittals should be linked to the receipt of comments on prior submittals, or the approval of prior submittals, rather than the permit adoption date. If it is tied to the permit adoption date, the submittal dates could become out of sync with the comment periods or San Diego Water Board approvals if any unexpected delays occur (for example if the San Diego Water Board is delayed in approving a document, or posting a document online for public comment). The Redline requests appropriate modifications.
  - Implementation dates for the plans are unclear / undefined. The Redline clarifies this issue.
- F.3. Progress Reports
  - The reporting requirements across the transitional period were unclear. Redlines are provided to clarify and consolidate.
  - The Regional Monitoring and Assessment Report language was revised to be consistent with the requirements of the Integrated Assessment of the Water Quality Improvement Plan, rather than an additional, slightly different report, due at the same time.

3.15 Attachments B and C

Comments and edits to Attachments B and C are shown in the Redline.

Very truly yours,

for JASON E. UHLEY
Chief of Watershed Protection Division

CP:cw
P8/

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN DIEGO REGION

TENTATIVE
ORDER NO. R9-2013-0001
NPDES NO. CAS0109266

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS WITHIN THE SAN DIEGO REGION

The San Diego County Copermittees in Table 1a are subject to waste discharge requirements set forth in this Order.

Table 1a. San Diego County Copermittees

Municipal Copermittees	
City of Carlsbad	City of Oceanside
City of Chula Vista	City of Poway
City of Coronado	City of San Diego
City of Del Mar	City of San Marcos
City of El Cajon	City of Santee
City of Encinitas	City of Solana Beach
City of Escondido	City of Vista
City of Imperial Beach	County of San Diego
City of La Mesa	San Diego County Regional Airport Authority
City of Lemon Grove	San Diego Unified Port District
City of National City	

After the San Diego Water Board receives and considers the Orange County Copermittees' Report of Waste Discharge and makes any necessary changes to the Order, the Orange County Copermittees in Table 1b will become subject to waste discharge requirements set forth in this Order after expiration of Order No. R9-2009-0002, NPDES No. CAS0108740 on or after December 16, 2014.

Table 1b. Orange County Copermittees

Municipal Copermittees	
City of Aliso Viejo	City of Rancho Santa Margarita
City of Dana Point	City of San Clemente
City of Laguna Beach	City of San Juan Capistrano
City of Laguna Hills	City of Laguna Woods
City of Laguna Niguel	County of Orange
City of Lake Forest	~~Orange County Flood Control District~~

City of Mission Viejo	
Special District Copermittee	
Orange County Flood Control District	

After the San Diego Water Board receives and considers the Riverside County Copermittees' Report of Waste Discharge and makes any necessary changes to this Order, the Riverside County Copermittees in Table 1c will become subject to waste discharge requirements set forth in this Order after expiration of Order No. R9-2010-0016, NPDES No. CAS0108766 on or after November 10, 2015.

Table 1c. Riverside County Copermittees

Municipal Copermittee	
City of Murrieta	County of Riverside
City of Temecula	~~Riverside County Flood Control and Water Conservation District~~
City of Wildomar	
Special District Copermittee	
Riverside County Flood Control and Water Conservation District	

The Orange County Copermittees and Riverside County Copermittees may become subject to the requirements of this Order at a date earlier than the expiration date of their current Orders subject to the conditions described in Provision F.6 of this Order if the Copermittees in the respective county receive a notification of coverage from the San Diego Water Board.

The term Copermittee in this Order refers to any San Diego County, Orange County, or Riverside County Copermittee covered under this Order, unless specified otherwise.

This Order provides permit coverage for the Copermittee discharges described in Table 2.

Table 2. Discharge Locations and Receiving Waters

Discharge Points	Locations throughout San Diego Region
Discharge Description	Municipal Separate Storm Sewer System (MS4) Discharges
Receiving Waters	Inland Surface Waters, Enclosed Bays and Estuaries, and Coastal Ocean Waters of the San Diego Region

Table 3. Administrative Information

This Order was adopted by the San Diego Water Board on:	**Month Day, 2013**
This Order will become effective on:	**Month Day, 2013**
This Order will expire on:	**Month Day, 2018**
The Copermittees must file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, as application for issuance of new waste discharge requirements no later than 180 days in advance of the Order expiration date.	

I, David W. Gibson, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on Month Day, 2013.

I. FINDINGS

Comment [A1]: See discussions in section 3.1 of the comment letter

The California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), finds that:

JURISDICTION

1. **MS4 Ownership or Operation.** Each of the Copermittees owns or operates an MS4, through which it discharges storm water and non-storm water into waters of the U.S. within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the U.S.

Many geographical areas subject to this Order are subject to the threat of periodic catastrophic flooding resulting from natural conditions, specifically the presence of mountains and hilly areas in close proximity to urban development and the effect of period strong Pacific Ocean storms. Such flooding would occur in the absence of development. The Legislature recognized the importance of this issue when it established flood control districts across the state, including in Orange, Riverside and San Diego Counties. Such flooding has in the past, and if not controlled, could in the future result in loss of life and property damage. Such flooding can also mobilize significant Pollutants from industrial, commercial, residential and agricultural lands, damaging watercourses and the beneficial uses thereof, including habitat. MS4s are designed and constructed to mitigate such impacts.

2. Riverside County Flood Control and Water Conservation District.

Comment [A2]: See discussion in section 3.1.1 of the comment letter.

In 1945, the California Legislature enacted the Riverside County Flood Control and Water Conservation District Act, establishing the Riverside County Flood Control and Water Conservation District (District). The objects and purposes of the Act are to provide for the control and conservation of flood and storm waters and for the protection of watercourses, watersheds, public highways, life and property within the District from damage or destruction from flood waters. Among its other powers, the District also has the power to conserve, reclaim and save such waters for beneficial use. However the Act does not provide the District with the power to control the volume or quality of discharges that runs off of private property, which may end up in the District's flood control system. The District is governed by the District's Board of Supervisors as a separate legal entity from the County of Riverside.

Many of the flood management systems that the District operates are defined by the Clean Water Act as an MS4, and include many of the larger MS4s within the Santa Margarita watershed region of Riverside County (SMR). District does not however own or operate streets, catch basins or storm drains smaller than 36 inches that collect runoff from the incorporated and unincorporated jurisdictions within the SMR, and commonly connect into the District's flood management system. Such systems are typically owned and operated by either the County of Riverside or the incorporated Cities within the SMR.

The waters and pollutants that may enter the regional receiving waters and/or the District's flood management systems come from various sources. These sources can include storm water and non-storm water from the Municipal Copermittees under this permit as well as from other NPDES and non-NPDES permittees, including industrial waste water dischargers, waste water treatment facilities, industrial and construction stormwater dischargers, water suppliers, tribal lands, other state and federal government entities, and Caltrans. Sources can also include discharges from Phase II entities such as school districts and discharges from entities that have been granted waste discharge requirements or waivers of waste discharge requirements, including agricultural operations.

The District does not own or operate any municipal sanitary sewer systems, public streets, roads, or highways. The District has no planning, zoning, development permitting or other land use authority, thus, it has no permitting or governing authority over industrial or commercial facilities, residents, new developments or re-development projects, and development construction sites located in any incorporated or unincorporated areas within its service area, including the SMR. The Copermittees that have such authority are responsible for implementing a storm water management program to address pollutants discharged from such industrial and commercial facilities, residential areas, new development and re-development projects, and development construction sites within their jurisdictional boundaries. Nonetheless, as an owner and operator of an MS4, the District is required to control pollutant discharges into and from its MS4, such as through interagency agreements among Copermittees and other owners of a MS4, the contribution of pollutants from one portion of the MS4 to another portion of the MS4 within their jurisdiction.

2. **Legal and Regulatory Authority.** This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations (Code of Federal Regulations [CFR] Title 40, Part 122 [40 CFR 122]) adopted by the United States Environmental Protection Agency (USEPA), and chapter 5.5, division 7 of the California Water Code (CWC) (commencing with section 13370). This Order serves as an NPDES permit for discharges from MS4s to surface waters. This Order also serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the CWC (commencing with section 13260).

   The San Diego Water Board has the legal authority to issue a regional MS4 permit pursuant to its authority under CWA section 402(p)(3)(B) and 40 CFR 122.26(a)(1)(v). The USEPA also made it clear that the permitting authority, in this case the San Diego Water Board, has the flexibility to establish system- or region-wide permits (55 Federal Register [FR] 47990, 48039-48042). The regional nature of this Order will ensure consistency of regulation within watersheds and is expected to result in overall cost savings for the Copermittees and San Diego Water Board.

The federal regulations make it clear that the Copermittees need only comply with permit conditions relating to discharges from the MS4s for which they are operators (40 CFR 122.26(a)(3)(vi)). This Order does not require the Copermittees to manage storm water outside of their jurisdictional boundaries, but rather to work collectively to improve storm water management within watersheds.

3. **CWA NPDES Permit Conditions.** Pursuant to CWA section 402(p)(3)(B), NPDES permits for storm water discharges from MS4s must include requirements to effectively prohibit non-storm water discharges into MS4s, and require controls to reduce the discharge of pollutants from the MS4s ~~in storm water~~ to the maximum extent practicable (MEP), and to require other provisions as the San Diego Water Board determines are appropriate to control such pollutants. This Order prescribes conditions to assure compliance with the CWA requirements for owners and operators of MS4s to effectively prohibit non-storm water discharges in to the MS4s, and require controls to reduce the discharge of pollutants ~~in storm water~~ from the MS4s to the MEP.

Comment [A3]: See discussion in section 3.1.2 of the comment letter.

4. **CWA and CWC Monitoring Requirements.** CWA section 308(a) and 40 CFR 122.41(h),(j)-(l) and 122.48 require that NPDES permits must specify monitoring and reporting requirements. Federal regulations applicable to large and medium MS4s also specify additional monitoring and reporting requirements in 40 CFR 122.26(d)(1)(iv)(D), 122.26(d)(1)(v)(B), 122.26(d)(2)(i)(F), 122.26(d)(2)(iii)(D), 122.26(d)(2)(iv)(B)(2) and 122.42(c). CWC section 13383 authorizes the San Diego Water Board to establish monitoring, inspection, entry, reporting and recordkeeping requirements. This Order establishes monitoring and reporting requirements to implement federal and State requirements.

5. **Total Maximum Daily Loads.** CWA section 303(d)(1)(A) requires that "[e]ach state shall identify those waters within its boundaries for which the effluent limitations…are not stringent enough to implement any water quality standard applicable to such waters." The CWA also requires states to establish a priority ranking of impaired water bodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired water bodies is called the Clean Water Act Section 303(d) List of Water Quality Limited Segments, commonly referred to as the 303(d) List. The CWA requires the 303(d) List to be updated every two years.

TMDLs are numerical calculations of the maximum amount of a pollutant that a water body can assimilate and still meet water quality standards. A TMDL is the sum of the allowable loads of a single pollutant from all contributing point sources (waste load allocations or WLAs) and non-point sources (load allocations or LAs), background contribution, plus a margin of safety. Discharges from MS4s are point source discharges. The federal regulations (40 CFR 122.44(d)(1)(vii)(B)) require that NPDES permits to incorporate water quality based effluent limitations (WQBELs) developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, consistent with the assumptions and requirements of any available WLA for the discharge. Requirements of this Order implement the TMDLs adopted by the San Diego Water Board and approved by USEPA.

6. **Non-Storm Water Discharges.** Pursuant to CWA section 402(p)(3)(B)(ii), this Order requires each Copermittee to effectively prohibit discharges of non-storm water into its MS4. Nevertheless, non-storm water discharges into and from the MS4s continue to be reported to the San Diego Water Board by the Copermittees and other persons. Monitoring conducted by the Copermittees, as well as the 303(d) List, have identified dry weather, non-storm water discharges from the MS4s as a source of pollutants causing or contributing to receiving water quality impairments in the San Diego Region. The federal regulations (40 CFR 122.26(d)(2)(iv)(B)(1)) require the Copermittees to have a program to prevent illicit discharges to the MS4. The federal regulations, however, allow for specific categories of non-storm water discharges or flows to be addressed as illicit discharges only where such discharges are identified as sources of pollutants to waters of the U.S.

7. **In-Stream Treatment Systems.** Pursuant to federal regulations (40 CFR 131.10(a)), in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Runoff treatment must occur prior to the discharge of runoff into receiving waters. Treatment control best management practices (BMPs) must not be constructed in waters of the U.S. Construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body.

DISCHARGE CHARACTERISTICS AND RUNOFF MANAGEMENT

8. **Point Source Discharges of Pollutants.** Discharges from the MS4s may contain waste, as defined in the CWC, and pollutants that adversely affect the quality of the waters of the state. A discharge from an MS4 is a "discharge of pollutants from a point source" into waters of the U.S. as defined in the CWA. Storm water and non-storm water discharges from the MS4s may contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Water Quality Control Plan for the San Diego Basin (Basin Plan). ~~Storm water and non-storm water discharges from the MS4s are subject to the conditions and requirements established in the Basin Plan for point source discharges.~~

9. **Potential Beneficial Use Impairment.** The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses or which may result~~ing~~ in a condition of pollution, contamination, or nuisance. In addition, the reduction of flows below the

existing condition may impact negatively impact beneficial uses.

10. **Pollutants Generated by Land Development.** Land development has created and continues to create new sources of non-storm water discharges and pollutants in storm water discharges as human population density increases. This brings higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, and trash. Pollutants from these sources are dumped or washed off the surface by non-storm water or storm water flows into and from the MS4s. When development converts natural vegetated pervious ground cover to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area without BMPs that can maintain pre-development conditions will contain greater pollutant loads and have significantly greater runoff volume, velocity, and peak flow rate than pre-development runoff from the same area.

11. **Runoff Discharges to Receiving Waters.** The MS4s discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within the eleven hydrologic units comprising the San Diego Region. ~~Historic and current development makes use of natural drainage patterns and features as conveyances for runoff. Rivers, streams and creeks in developed areas used in this manner are part of the Copermittees' MS4s regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the rivers, streams and creeks in the developed areas of the Copermittees' jurisdictions are both an MS4 and receiving water.~~ Numerous receiving water bodies and water body segments have been designated as impaired by the San Diego Water Board pursuant to CWA section 303(d).

Pollutants in Runoff. The most common pollutants in runoff discharged from the MS4s include total suspended solids, sediment, pathogens (e.g., bacteria, viruses, protozoa), heavy metals (e.g., cadmium, copper, lead, and zinc), petroleum products and polynuclear aromatic hydrocarbons, synthetic organics (e.g., pesticides, herbicides, and PCBs), nutrients (e.g., nitrogen and phosphorus), oxygen-demanding substances (e.g., decaying vegetation, animal waste), detergents, and trash. ~~As operators of the MS4s, the Copermittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not effectively prohibit or otherwise control.~~ These discharges may cause or contribute to a condition of pollution or a violation of water quality standards. California law requires downstream landowners, including owners and operators of MS4, to accept upstream flows, even if that flow contains Pollutants. Failure to do can create conditions.

Limitation on Powers of Copermittees. This Order regulates the discharge of non-stormwater into and Pollutants from non-agricultural Anthropogenic sources from the MS4s owned and/or operated by the Copermittees. The Copermittees lack legal

Comment [A4]: See discussion in section 3.1.2 of the comment letter.

Comment [A5]: See discussion in section 3.1.2 of the comment letter.

Comment [A6]: This finding is based on Findings I.B and I.C in Order R8-2010-33, applicable to portions of Riverside County within the Santa Ana region.

jurisdiction over discharges into their MS4 from agricultural activities, State and federal facilities, public schools and hospitals, utilities, railroads, special districts, Native American tribal lands, wastewater management agencies and other point and non-point source discharges otherwise permitted by the Water Board. The Water Board recognizes that the Copermittees should not be held responsible for discharges from such facilities or Pollutants in those discharges. Also, certain activities and sources that generate pollutants present in urban runoff may be beyond the ability of the Copermittees to prevent or eliminate. Examples of these activities and sources include, but are not limited to: emissions from internal combustion engines, brake pad wear and tear, atmospheric deposition, non-Anthropogenic sources of bacteria (including wildlife and feral cats and dogs), the regulation of pesticides and leaching of naturally occurring nutrients and minerals from local soils. This Order is not intended to address background or naturally occurring Pollutants or flows.

12.

13. **Human Health and Aquatic Life Impairment.** Pollutants in runoff discharged from the MS4s can threaten and adversely affect human health and aquatic organisms. Adverse responses of organisms to chemicals or physical agents in runoff range from physiological responses such as impaired reproduction or growth anomalies to mortality. Increased volume, velocity, rate, and duration of storm water runoff greatly accelerate the erosion of downstream natural channels. This alters stream channels and habitats and can adversely affect aquatic and terrestrial organisms.

14. **Water Quality Effects.** The Copermittees' water quality monitoring data submitted to date documents various persistent exceedances of Basin Plan water quality objectives for runoff-related pollutants at various watershed monitoring stations. Persistent toxicity has also been observed at several watershed monitoring stations. In addition, bioassessment data indicate that the majority of the monitored receiving waters have Poor to Very Poor Index of Biological Integrity (IBI) ratings. ~~These findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in the San Diego Region. Non-storm water discharges from the MS4s have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds, and contribute significantly to exceedances of applicable receiving water quality objectives.~~

Comment [A7]: These statements are completely unsubstantiated.

15. ~~**Non-Storm Water and Storm Water Discharges.** Non-storm water discharges from the MS4s are not considered storm water discharges and therefore are not subject to the MEP standard of CWA section 402(p)(3)(B)(iii), which is explicitly for "Municipal … *Stormwater Discharges* (emphasis added)" from the MS4s. Pursuant to CWA 402(p)(3)(B)(ii), non-storm water discharges into the MS4s must be effectively prohibited.~~

Comment [A8]: See discussion in section 3.1.2 of the comment letter.

16. **Best Management Practices.** Waste and pollutants which are deposited and accumulate in MS4 drainage structures may~~will~~ be discharged from these structures

to waters of the U.S. unless they are removed. These discharges may cause or contribute to, or threaten to cause or contribute to, a condition of pollution in receiving waters. For this reason, pollutants in storm water discharges from the MS4s can be and must be effectively reduced in runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and runoff, therefore keeping pollutants onsite and out of receiving waters. Treatment control BMPs remove pollutants that have been mobilized by storm water or non-storm water flows.

17. **BMP Implementation.** Runoff needs to be addressed during the three major phases of development (planning, construction, and use) in order to reduce the discharge of storm water pollutants to the MEP, effectively prohibit non-storm water discharges, and protect receiving waters. Development which is not guided by water quality planning policies and principles can result in increased pollutant load discharges, flow rates, and flow durations which can negatively affect receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development can generate substantial pollutant loads which are discharged in runoff to receiving waters. Retrofitting areas of existing development with storm water pollutant control and hydromodification management BMPs may in many cases be ~~is~~ necessary to address storm water discharges from existing development that may cause or contribute to a condition of pollution or a violation of water quality standards.

Comment [A9]: It is not necessary in all cases.

18. **Long Term Planning and Implementation.** Federal regulations require municipal storm water permits to expire 5 years from adoption, after which the permit must be renewed and reissued. The San Diego Water Board recognizes that the degradation of water quality and impacts to beneficial uses of the waters in the San Diego Region occurred over several decades. The San Diego Water Board further recognizes that a decade or more may be necessary to realize demonstrable improvement to the quality of waters in the Region. This Order includes a long term planning and implementation approach that will require more than a single permit term to complete.

WATER QUALITY STANDARDS

19. **Basin Plan.** The San Diego Water Board adopted the Water Quality Control Plan for the San Diego Basin (Basin Plan) on September 8, 1994 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for receiving waters addressed through the plan. The Basin Plan was subsequently approved by the State Water

Resources Control Board (State Water Board) on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the San Diego Water Board and approved by the State Water Board. Requirements of this Order implement the Basin Plan.

The Basin Plan identifies the following existing and potential beneficial uses for inland surface waters in the San Diego Region: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional existing and potential beneficial uses are identified for coastal waters of the San Diego Region: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

20. **Ocean Plan.** The State Water Board adopted the Water Quality Control Plan for Ocean Waters of California, California Ocean Plan (Ocean Plan) in 1972 and amended it in 1978, 1983, 1988, 1990, 1997, 2000, and 2005. The State Water Board adopted the latest amendment on April 21, 2005 and it became effective on February 14, 2006. The Ocean Plan is applicable, in its entirety, to point source discharges to the ocean. Requirements of this Order implement the Ocean Plan.

    The Ocean Plan identifies the following beneficial uses of ocean waters of the state to be protected: Industrial water supply; water contact and non-contact recreation, including aesthetic enjoyment; navigation; commercial and sport fishing; mariculture; preservation and enhancement of designated Areas of Special Biological Significance; rare and endangered species; marine habitat; fish spawning and shellfish harvesting

21. **Sediment Quality Control Plan**. On September 16, 2008, the State Water Board adopted the Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality (Sediment Quality Control Plan). The Sediment Quality Control Plan became effective on August 25, 2009. The Sediment Quality Control Plan establishes: 1) narrative sediment quality objectives for benthic community protection from exposure to contaminants in sediment and to protect human health, and 2) a program of implementation using a multiple lines of evidence approach to interpret the narrative sediment quality objectives. Requirements of this Order implement the Sediment Quality Control Plan.

22. **National Toxics Rule and California Toxics Rule.** USEPA adopted the National Toxics Rule (NTR) on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the California Toxics Rule (CTR). The CTR promulgated

new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.

23. **Antidegradation Policy.** This Order is in conformance with the federal Antidegradation Policy described in 40 CFR 131.12, and State Water Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*. Federal regulations at 40 CFR 131.12 require that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. State Water Board Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. State Water Board Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies.

CONSIDERATIONS UNDER FEDERAL AND STATE LAW

24. **Coastal Zone Act Reauthorization Amendments.** Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point source pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point source pollution: agriculture, silviculture, urban, marinas, and hydromodification. This Order addresses the management measures required for the urban category, with the exception of septic systems. The runoff management programs developed pursuant to this Order fulfills the need for coastal cities to develop a runoff non-point source plan identified in the Non-Point Source Program Strategy and Implementation Plan. The San Diego Water Board addresses septic systems through the administration of other programs.

25. **Endangered Species Act.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code sections 2050 to 2097) or the Federal Endangered Species Act (16 USC sections 1531 to 1544). This Order requires compliance with receiving water limits, and other requirements to protect the beneficial uses of waters of the State. The Copermittees are responsible for meeting all requirements of the applicable Endangered Species Act.

26. **Report of Waste Discharge Process.** The waste discharge requirements set forth in this Order are based upon the Report of Waste Discharge submitted by the San Diego County Copermittees prior to the expiration of Order No. R9-2007-0001 (NPDES No. CAS0109266). The Orange County and Riverside County Copermittees are not immediately covered by the waste discharge requirements in this Order. The San Diego Water Board understands that each municipality is

unique although the Counties share watersheds and geographical boundaries. The Order will continue to use the Report of Waste Discharge process prior to initially making Orange County or Riverside County Copermittees subject to the requirements of this Order.

The federal regulations (40 CFR 122.21(d)(2)) and CWC section 13376 impose a duty on the Copermittees to reapply for continued coverage through submittal of a Report of Waste Discharge no later than 180 days prior to expiration of a currently effective permit. This requirement is set forth in the Orange County Copermittees' and Riverside County Copermittees' currently effective permits at Provisions K.2.b and K.2.c, respectively. The Orange County Permit, Order No. R9-2009-0002 (NPDES No. CAS0108740) expires on December 16, 2014 and the Riverside County MS4 Permit, Order No. R9-2010-0016 (NPDES No. CAS0108766) expires on November 10, 2015.

Unless the Orange County or Riverside County Copermittees apply for and receive early coverage under this Order, the Orange County Copermittees' and the Riverside County Copermittees' respective permits will be superseded by this Order upon expiration of their respective permits, subject to any necessary revisions to the requirements of this Order made after the San Diego Water Board considers their respective Reports of Waste Discharge through the public process provided in 40 CFR 124.

Comment [A10]: Please see Comment Letter and Legal Comments regarding regional permit authority,

27. **Integrated Report and Clean Water Act Section 303(d) List.** The San Diego Water Board and State Water Board submit an Integrated Report to USEPA to comply with the reporting requirements of CWA sections 303(d), 305(b) and 314, which lists the attainment status of water quality standards for water bodies in the San Diego Region. USEPA issued its *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* on July 29, 2005, which advocates the use of a five category approach for classifying the attainment status of water quality standards for water bodies in the Integrated Report. Water bodies included in Category 5 in the Integrated Report indicate at least one beneficial use is not being supported or is threatened, and a TMDL is required. Water bodies included in Category 5 in the Integrated Report are placed on the 303(d) List.

Water bodies with available data and/or information that indicate at least one beneficial use is not being supported or is threatened, but a TMDL is not required, are included in Category 4 in the Integrated Report. Impaired surface water bodies may be included in Category 4 if a TMDL has been adopted and approved (Category 4a); if other pollution control requirements required by a local, state or federal authority are stringent enough to implement applicable water quality standards within a reasonable period of time (Category 4b); or, if the failure to meet an applicable water quality standard is not caused by a pollutant, but caused by other types of pollution (Category 4c).

Implementation of the requirements of this Order may allow the San Diego Water Board to include surface waters impaired by discharges from the Copermittees'

MS4s in Category 4 in the Integrated Report for consideration during the next 303(d) List submittal by the State to USEPA.

28. **Economic Considerations.** The California Supreme Court has ruled that although CWC section 13263 requires the State and Regional Water Boards (collectively Water Boards) to consider factors set forth in CWC section 13241 when issuing an NPDES permit, the Water Board may not consider the factors to justify imposing pollutant restrictions that are less stringent than the applicable federal regulations require. (*City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 618, 626-627.) However, when pollutant restrictions in an NPDES permit are more stringent than federal law requires, CWC section 13263 requires that the Water Boards consider the factors described in CWC section 13241 as they apply to those specific restrictions.

As noted in the following finding, the San Diego Water Board finds that the requirements in this permit are not more stringent than the minimum federal requirements. Therefore, a CWC section 13241 analysis is not required for permit requirements that implement the effective prohibition on the discharge of non-storm water into the MS4 or for controls to reduce the discharge of pollutants ~~in storm water~~ to the MEP, or other provisions that the San Diego Water Board has determined appropriate to control such pollutants, as those requirements are mandated by federal law. Notwithstanding the above, the San Diego Water Board has developed an economic analysis of the requirements in this Order. The economic analysis is provided in the Fact Sheet.

Comment [A11]: See discussion in section 3.1.2 of the Comment Letter and also Legal Comments..

29. ~~**Unfunded Mandates.** This Order does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following:~~

Comment [A12]: See discussion in section 3.1.2 of the comment letter and in the Legal Comments.

~~a. This Order implements federally mandated requirements under CWA section 402 (33 USC section 1342(p)(3)(B)).~~

~~b. The local agency Copermittees' obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges.~~

~~c. The local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order.~~

~~d. The Copermittees have requested permit coverage in lieu of compliance with the complete effective prohibition against the discharge of pollutants contained in CWA section 301(a) (33 USC section 1311(a)) and in lieu of numeric restrictions on their MS4 discharges (i.e. effluent limitations).~~

~~e. The local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIIIB, Section (6) of the California Constitution.~~

~~f. The provisions of this Order to implement TMDLs are federal mandates. The CWA requires TMDLs to be developed for water bodies that do not meet federal water quality standards (33 USC section 1313(d)). Once the USEPA or a state develops a TMDL, federal law requires that permits must contain water quality based effluent limitations consistent with the assumptions and requirements of any applicable wasteload allocation (40 CFR 122.44(d)(1)(vii)(B)).~~

~~See the Fact Sheet for further discussion of unfunded mandates.~~

30. **California Environmental Quality Act.** The issuance of waste discharge requirements and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with CWC section 13389.

STATE WATER BOARD DECISIONS

31. **Compliance with Prohibitions and Limitations.** The receiving water limitation language specified in this Order is consistent with language recommended by the USEPA and established in State Water Board Order WQ 99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Water Board on June 17, 1999. The receiving water limitation language in this Order requires storm water discharges from MS4s to not cause or contribute to a violation of water quality standards, which is to be achieved through an iterative approach requiring the implementation of improved and better-tailored BMPs over time. Implementation of the iterative approach to comply with receiving water limitations based on applicable water quality standards is necessary to ensure that Pollutant ~~storm water~~ discharges from the MS4 will not ultimately cause or contribute to violations of water quality standards and will not create conditions of pollution, contamination, or nuisance.

32. **Special Conditions for Areas of Special Biological Significance.** On March 20, 2012, the State Water Board approved Resolution No. 2012-0012 approving an exception to the Ocean Plan effective prohibition against discharges to Areas of Special Biological Significance (ASBS) for certain nonpoint source discharges and NPDES permitted municipal storm water discharges. State Water Board Resolution No. 2012-0012 requires monitoring and testing of marine aquatic life and water quality in several ASBS to protect California's coastline during storms when rain water overflows into coastal waters. Specific terms, effective prohibitions, and special conditions were adopted to provide special protections for marine aquatic life and natural water quality in ASBS. The City of San Diego's municipal storm water discharges to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's municipal storm water discharges to the Heisler Park ASBS are subject terms and conditions of State Water Board Resolution No. 2012-0012. The Special

Comment [A13]: See discussion in section 3.1.2 of the comment letter.

Comment [A14]: Please see discussion in section 3.1.2 of the Comment Letter and Legal Comments.

Protections contained in Attachment B to Resolution No. 2012-0012, applicable to these discharges, are hereby incorporated into this Order as if fully set forth herein.

ADMINISTRATIVE FINDINGS

33. **Executive Officer Delegation of Authority.** The San Diego Water Board by prior resolution has delegated all matters that may legally be delegated to its Executive Officer to act on its behalf pursuant to CWC section 13223. Therefore, the Executive Officer is authorized to act on the San Diego Water Board's behalf on any matter within this Order unless such delegation is unlawful under CWC section 13223 or this Order explicitly states otherwise.

34. **Standard Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment B to this Order.

35. **Fact Sheet.** The Fact Sheet for this Order contains background information, regulatory and legal citations, references and additional explanatory information and data in support of the requirements of this Order. The Fact Sheet is hereby incorporated into this Order and constitutes part of the Findings of this Order.

36. **Public Notice.** In accordance with State and federal laws and regulations, the San Diego Water Board notified the Copermittees, and interested agencies and persons of its intent to prescribe waste discharge requirements for the control of discharges into and from the MS4s to waters of the U.S. and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet.

37. **Public Hearing.** The San Diego Water Board held a public hearing on Month Day, 2013 and heard and considered all comments pertaining to the terms and conditions of this Order. Details of the public hearing are provided in the Fact Sheet.

38. **Effective Date.** This Order serves as an NPDES permit pursuant to CWA section 401 or amendments thereto, and becomes effective fifty (50) days after the date of its adoption, provided that the Regional Administrator, USEPA, Region IX, does not object to this Order.

39. **Review by the State Water Board.** Any person aggrieved by this action of the San Diego Water Board may petition the State Water Board to review the action in accordance with CWC section 13320 and California Code of Regulations, title 23, sections 2050, et seq. The State Water Board must receive the petition by 5:00 p.m., 30 days after the San Diego Water Board action, except that if the thirtieth day following the action falls on a Saturday, Sunday or State holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the

Internet at: http://www.waterboards.ca.gov/public_notices/petitions/water_quality or will be provided upon request.

THEREFORE, IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA and regulations adopted thereunder, must each comply with the following:

II. PROVISIONS

A. PROHIBITIONS AND LIMITATIONS

Comment [A15]: See discussion in section 3.2 of the comment letter.

The purpose of this provision is to describe the conditions under which storm water and non-storm water discharges into and from MS4s are to be effectively prohibited or limited. The goal of the prohibitions and limitations is to protect the water quality and designated beneficial uses of waters of the state from adverse impacts caused or contributed to by MS4 discharges. This goal will be accomplished through the implementation of water quality improvement strategies and runoff management programs that effectively prohibit non-storm water discharges into the Copermittees' MS4s, and reduce pollutants in ~~storm water~~ discharges from the Copermittees' MS4s to the MEP. The process for determination of compliance with the Discharge Prohibitions (A.1), Receiving Water Limitations (A.2), and Effluent Limitations (A.3) is defined in Provisions A.3.b and A.4.

1. Discharge Prohibitions

a. Discharges from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance in receiving waters ~~of the state~~ are to be ~~prohibited.~~ effectively prohibited, unless the Regional Board determines such discharges are addressed by the Copermittee through A.3.b or A.4, including any modifications.~~prohibited.~~

Comment [A16]: See discussion in section 3.2.2 of the comment letter.

b. Non-storm water discharges into MS4s are to be effectively prohibited through a program consistent with the requirements of provision E.2. of this order, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the MS4, unless such discharges are either authorized by a separate NPDES permit, or the discharge is a category of non-storm water discharges or flows that must be addressed pursuant to Provisions E.2.a.(1)-(5) of this Order.

Comment [A17]: See discussion in section 3.2.2 of the comment letter.

c. Discharges from MS4s are subject to all applicable waste discharge prohibitions in the Basin Plan, included in Attachment A to this Order, unless the Regional Board determines such discharges are addressed by the Copermittee through A.3.b or A.4, including any modifications.

Comment [A18]: See discussion in section 3.2.2 of the comment letter.

d. Storm water discharges from the City of San Diego's MS4 to the San Diego Marine Life Refuge in La Jolla, and the City of Laguna Beach's MS4 to the Heisler Park ASBS are authorized under this Order subject to the Special Protections contained in Attachment B to State Water Board Resolution No.

2012-0012 applicable to these discharges, included in Attachment A to this Order. All other discharges from the Copermittees' MS4s to ASBS are ~~to be effectively~~ prohibited.

2. Receiving Water Limitations

Comment [A19]: See discussion in section 3.2.2 of the comment letter.

a. Discharges from MS4s must not cause or contribute to the violation of water quality standards in any receiving waters, including but not limited to all applicable provisions ~~contained in:~~below, unless the Regional Board determines such discharges are addressed by the Copermittee through A.3.b or A.4::~~contained in:~~

(1) The San Diego Water Board's Basin Plan, including beneficial uses, water quality objectives, and implementation plans;

(2) State Water Board plans for water quality control including the following:

(a) Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries (Thermal Plan), and

(b) The Ocean Plan, including beneficial uses, water quality objectives, and implementation plans;

(3) State Water Board policies for water and sediment quality control including the following:

(a) Water Quality Control Policy for the Enclosed Bays and Estuaries of California,

(b) Sediment Quality Control Plan which includes the following narrative objectives for bays and estuaries:

(i) Pollutants in sediments shall not be present in quantities that, alone or in combination, are toxic to benthic communities, and

(ii) Pollutants shall not be present in sediments at levels that will bioaccumulate in aquatic life to levels that are harmful to human health,

(c) The Statement of Policy with Respect to Maintaining High Quality of Waters in California;[1]

(4) Priority pollutant criteria promulgated by the USEPA through the following:

[1] State Water Board Resolution No. 68-16

(a) National Toxics Rule (NTR)[2] (promulgated on December 22, 1992 and amended on May 4, 1995), and

(b) California Toxics Rule (CTR).[3,4]

b. Discharges from MS4s composed of storm water runoff must not alter natural ocean water quality in an ASBS.

[2] 40 CFR 131.36
[3] 65 Federal Register 31682-31719 (May 18, 2000), adding Section 131.38 to 40 CFR
[4] If a water quality objective and a CTR criterion are in effect for the same priority pollutant, the more stringent of the two applies.

3. Effluent Limitations

a. TECHNOLOGY BASED EFFLUENT LIMITATIONS

Comment [A20]: See discussion in section 3.2.2 of the comment letter.

Pollutants in ~~storm water~~ discharges from MS4s must be reduced to the MEP.[5]

b. WATER QUALITY BASED EFFLUENT LIMITATIONS

This Order establishes water quality based effluent limitations (WQBELs) consistent with the assumptions and requirements of all available TMDL waste load allocations (WLAs) assigned to discharges from the Copermittees' MS4s. Each Copermittee must comply with applicable WQBELs established for the TMDLs in Attachment E to this Order, pursuant to the applicable TMDL compliance schedules.

4. Compliance with Discharge Prohibitions and Receiving Water Limitations

Comment [A21]: See discussion in section 3.2.2 of the comment letter.

Each Copermittee must achieve compliance with Provisions A.1.a~~,~~ through A.1.c and A.2.a of this Order through timely implementation of control measures and other actions as specified in Provisions B and E of this Order, including any modifications. The Water Quality Improvement Plans required under Provision B must be designed and adapted to ultimately achieve compliance with Provisions A.1.a~~,~~ through A.1.c and A.2.a~~.~~, as described in Provision B.2.~~.~~

a. If exceedance(s) of water quality standards persist in receiving waters notwithstanding implementation of this Order, the Copermittees must comply with the following procedures:

(1) For exceedance(s) of a water quality standard in the process of being addressed by the Water Quality Improvement Plan, the Copermittee(s) must implement the Water Quality Improvement Plan as accepted by the San Diego Water Board, and update the Water Quality Improvement Plan, as necessary, pursuant to Provision F.2.c;

(2) Upon a determination by either the Copermittees or the San Diego Water Board that discharges from the MS4 are causing or contributing to a new exceedance of an applicable water quality standard not addressed by the Water Quality Improvement Plan, the Copermittees must submit the following updates to the Water Quality Improvement Plan pursuant to Provision F.2.c or as part of the Annual Report required under Provision F.3.b, unless the San

[5] This does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants in storm water discharges to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer). Runoff treatment must occur prior to the discharge of runoff into receiving waters per Finding 7.

Diego Water Board directs an earlier submittal:

(a) The water quality improvement strategies being implemented that are effective and will continue to be implemented,

(b) Water quality improvement strategies (i.e. BMPs, retrofitting projects, stream and/or habitat rehabilitation or restoration projects, adjustments to jurisdictional runoff management programs, etc.) that will be implemented to reduce or eliminate any pollutants or conditions that are causing or contributing to the exceedance of water quality standards,

(c) Updates to the schedule for implementation of the existing and additional water quality improvement strategies, and

(d) Updates to the monitoring and assessment program to track progress toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a of this Order;

(3) The San Diego Water Board may require the incorporation of additional modifications to the Water Quality Improvement Plan required under Provision B. The applicable Copermittees must submit any modifications to the update to the Water Quality Improvement Plan within 90 days of notification that additional modifications are required by the San Diego Water Board, or as otherwise directed;

(4) Within 90 days of the San Diego Water Board determination that the update to the Water Quality Improvement Plan meets the requirements of this Order, the applicable Copermittees must revise the jurisdictional runoff management program documents to incorporate the updated water quality improvement strategies that have been and will be implemented, the implementation schedule, and any additional monitoring required; and

(5) Each Copermittee must implement the updated Water Quality Improvement Plan.

b. The procedure set forth above to achieve compliance with Provisions A.1.a, A.1.c and A.2.a of this Order do not have to be repeated for continuing or recurring exceedances of the same water quality standard(s) following implementation of scheduled actions unless directed to do otherwise by the San Diego Water Board.

c. Nothing in Provisions A.4.a and A.4.b prevents the San Diego Water Board from enforcing any of provisions B through I of this Order while the applicable Copermittees prepare and implement the above update to the Water Quality Improvement Plan and jurisdictional runoff management programs.

April 10 and 11, 2013
Item No. 8
Supporting Document No. 5

B. WATER QUALITY IMPROVEMENT PLANS

Comment [A22]: See section 3.3 of the comment letter for discussions of the changes requested herein.

The purpose of this provision is to develop Water Quality Improvement Plans (WQIPs) that guide the Copermittees' jurisdictional runoff management programs towards achieving the outcome of improved water quality in MS4 discharges and receiving waters. The goal of the Water Quality Improvement Plans is to ~~protect, preserve, enhance, and restorerestore the~~address the impacts of MS4 discharges so that such discharges do not impair water quality and designated beneficial uses of receiving waters. ~~of the state.~~ Therefore, implementation of the WQIPs also provides the basis for complying with Provisions II.A.1, II.A.2, and II.A.3, as described in Provision II.A.4. This goal will be accomplished through an adaptive planning and management process that identifies the highest priority water quality conditions within a watershed and implements strategies through the jurisdictional runoff management programs to achieve improvements in the quality of discharges from the MS4s ~~and~~ to receiving waters. As such, the requirements outlined in Provision E may be modified for consistency with the WQIP priorities for the applicable Watershed Management Area, if appropriate justification is provided approved within the WQIP.

Comment [A23]: See discussion in section 3.3.2 of the comment letter.

1. Watershed Management Areas

Comment [A24]: See discussion in section 3.3.2 of the comment letter.

The Copermittees must develop a Water Quality Improvement Plan for each of the Watershed Management Areas in Table B-1. A total of ten Water Quality Improvement Plans must be developed for the San Diego Region.

Development of the Water Quality Improvement Plan for the Santa Margarita River Watershed Management Area shall commence upon notification of coverage of the Riverside County Copermittees under this Order. Until this time, the County of San Diego shall use the water quality priorities in the Santa Margarita River Watershed Urban Runoff Management Plan, developed pursuant to Order No. R9-2007-0001, to guide implementation of Provisions D and E within its jurisdiction

Table B-1. Watershed Management Areas

Hydrologic Unit(s)	Watershed Management Area	Major Surface Water Bodies	Responsible Copermittees
San Juan (901.00)	South Orange County	- Aliso Creek - San Juan Creek - San Mateo Creek - Pacific Ocean - Heisler Park ASBS	- City of Aliso Viejo[1] - City of Dana Point[1] - City of Laguna Beach[1] - City of Laguna Hills[1] - City of Laguna Niguel[1] - City of Laguna Woods[1] - City of Lake Forest[1] - City of Mission Viejo[1] - City of Rancho Santa Margarita[1] - City of San Clemente[1] - City of San Juan Capistrano[1] - County of Orange[1] - Orange County Flood Control District[1]

Table B-1. Watershed Management Areas

Hydrologic Unit(s)	Watershed Management Area	Major Surface Water Bodies	Responsible Copermittees
Santa Margarita (902.00)	Santa Margarita River	- Murrieta Creek - Temecula Creek - Santa Margarita River - Santa Margarita Lagoon - Pacific Ocean	- City of Murrieta[2] - City of Temecula[2] - City of Wildomar[2] - County of Riverside[2] - County of San Diego[3] - Riverside County Flood Control and Water Conservation District[2]
San Luis Rey (903.00)	San Luis Rey River	- San Luis Rey River - San Luis Rey Estuary - Pacific Ocean	- City of Oceanside - City of Vista - County of San Diego
Carlsbad (904.00)	Carlsbad	- Loma Alta Slough - Buena Vista Lagoon - Agua Hedionda Lagoon - Batiquitos Lagoon - San Elijo Lagoon - Pacific Ocean	- City of Carlsbad - City of Encinitas - City of Escondido - City of Oceanside - City of San Marcos - City of Solana Beach - City of Vista - County of San Diego
San Dieguito (905.00)	San Dieguito River	- San Dieguito River - San Dieguito Lagoon - Pacific Ocean	- City of Del Mar - City of Escondido - City of Poway - City of San Diego - City of Solana Beach - County of San Diego
Penasquitos (906.00)	Penasquitos	- Los Penasquitos Lagoon - Pacific Ocean	- City of Del Mar - City of Poway - City of San Diego - County of San Diego
	Mission Bay	- Mission Bay - Pacific Ocean - San Diego Marine Life Refuge ASBS	- City of San Diego
San Diego (907.00)	San Diego River	- San Diego River - Pacific Ocean	- City of El Cajon - City of La Mesa - City of San Diego - City of Santee - County of San Diego

Tijuana (911.00)	Tijuana River	- Tijuana River - Tijuana Estuary - Pacific Ocean	- City of Imperial Beach - City of San Diego - County of San Diego

Notes:
1. The Orange County Copermittees will be covered under this Order after expiration of Order No. R9-2009-0002, or earlier if the Orange County Copermittees meet the conditions in Provision F.6.
2. The Riverside County Copermittees will be covered under this Order after expiration of Order No. R9-2010-0016, or earlier if the Riverside County Copermittees meet the conditions in Provision F.6.
3. The County of San Diego is required to implement the requirements of Provision B for its jurisdiction within the Santa

Margarita River Watershed Management Area until the Riverside County Copermittees have been notified of coverage under this Order.

2. Priority Water Quality Conditions

The Copermittees must identify the water quality priorities within each Watershed Management Area that will be addressed by the Water Quality Improvement Plan. Where appropriate, Watershed Management Areas may be separated into subwatersheds to focus water quality prioritization and jurisdictional runoff management program implementation efforts by receiving water.

a. Assessment of Receiving Water Conditions

The Copermittees must consider the following, at a minimum, to identify water quality priorities based on impacts of MS4 discharges on receiving water beneficial uses:

(1) Receiving waters listed as impaired on the CWA Section 303(d) List of Water Quality Limited Segments (303(d) List);

(2) TMDLs adopted and under development by the San Diego Water Board;

(3) Receiving waters recognized as sensitive or highly valued by the Copermittees, including estuaries designated under the National Estuary Program under CWA section 320, wetlands defined by the State or U.S. Fish and Wildlife Service's National Wetlands Inventory as wetlands, and receiving waters identified as ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (Attachment A);

(4) The receiving water limitations of Provision A.2;

(5) Known historical versus current physical, chemical, and biological water quality conditions;

(6) Available, relevant, and appropriately collected and analyzed physical, chemical, and biological receiving water monitoring data, including, but not limited to, data describing:

(a) Chemical constituents,

(b) Water quality parameters (i.e. pH, temperature, conductivity, etc.),

(c) Toxicity Identification Evaluations for both receiving water column and sediment,

(d) Trash impacts,

(e) Bioassessments, and

(f) Physical habitat;

(7) Available evidence of erosional impacts in receiving waters due to accelerated flows (i.e. hydromodification);

(8) Available evidence of adverse impacts to the chemical, physical, and biological integrity of receiving waters; and

(9) The potential improvements in the overall condition of the Watershed Management Area that can be achieved.

b. ASSESSMENT OF IMPACTS FROM MS4 DISCHARGES

The Copermittees must consider the following, at a minimum, to identify the potential impacts to receiving waters that may be caused or contributed to by discharges from the Copermittees' MS4s:

(1) The discharge prohibitions of Provision A.1 and effluent limitations of Provision A.3; and

(2) Available, relevant, and appropriately collected and analyzed storm water and non-storm water monitoring data from the Copermittees' MS4 outfalls;

(3) Locations of each Copermittee's MS4 outfalls that discharge to receiving waters;

(4) Locations of MS4 outfalls that are known to persistently discharge non-storm water to receiving waters likely causing or contributing to impacts on receiving water beneficial uses;

(5) Locations of MS4 outfalls that are known to discharge pollutants in storm water causing or contributing to impacts on receiving water beneficial uses; and

(6) The potential improvements in the quality of discharges from the MS4 that can be achieved.

c. IDENTIFICATION OF PRIORITY WATER QUALITY CONDITIONS

(1) The Copermittees must use the information gathered for Provisions B.2.a and B.2.b to develop a list of priority water quality conditions as pollutants, stressors and/or receiving water conditions that are the highest threat to receiving water quality or that most adversely affect the physical, chemical, and biological integrity of receiving waters. The list must include the following information for each priority water quality condition:

(a) The beneficial use(s) associated with the priority water quality condition;

(b) The geographic extent of the priority water quality condition within the Watershed Management Area, if known;

(c) The temporal extent of the priority water quality condition (e.g., dry weather and/or wet weather);

(d) The Copermittees with MS4s discharges that may cause or contribute to the priority water quality condition; and

(e) An assessment of the adequacy of and data gaps in the monitoring data to characterize the conditions causing or contributing to the priority water quality condition, including a consideration of spatial and temporal variation.

(2) The Copermittees must identify the highest priority water quality conditions to be addressed by the Water Quality Improvement Plan, and provide a rationale for selecting a subset of the water quality conditions identified pursuant to Provision B.2.c.(1) as the highest priorities.

d. IDENTIFICATION OF MS4 SOURCES OF POLLUTANTS AND/OR STRESSORS

The Copermittees must identify and prioritize known and suspected sources of storm water and non-storm water pollutants and/or other stressors within their jurisdiction, associated with MS4 discharges that cause or contribute to the highest priority water quality conditions identified under Provision B.2.c. ~~The identification of known and suspected sources of pollutants and/or stressors that cause or contribute to the highest priority water quality conditions as identified for Provision B.2.c must~~ considering the following:

(1) Pollutant generating facilities, areas, and/or activities within the Watershed Management Area, including:

(a) Each Copermittee's inventory of construction sites, commercial facilities or areas, industrial facilities, municipal facilities, and residential areas,

(b) Publicly owned parks and/or recreational areas,

(c) Open space areas,

(d) All currently operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste,,, and

(e) Areas not within the Copermittees' jurisdictions (e.g., Phase II MS4s, tribal lands, state lands, federal lands) that are known or suspected to be discharging to the Copermittees' MS4s;

(2) Locations of the Copermittees' MS4s, including the following:

(a) All major MS4 outfalls [per 40CFR 122.26 (b)(5)] that discharge to receiving waters, and

(b) Locations of major structural controls for storm water and non-storm water (e.g., retention basins, detention basins, major infiltration devices, etc.);

(3) Other known and suspected sources of non-storm water or pollutants in storm water discharges to receiving waters within the Watershed Management Area, including the following:

(a) Other MS4 outfalls (e.g., Phase II Municipal and Caltrans),

(b) Other NPDES permitted discharges,

(c) Any other discharges that may be considered point sources (e.g., private outfalls), and

(d) Any other discharges that may be considered non-point sources (e.g., agriculture, wildlife or other natural sources);

(4) Review of available data, including but not limited to:

(a) Findings from the Copermittees' illicit discharge detection and elimination programs,

(b) Findings from the Copermittees' MS4 outfall discharge monitoring,

(c) Findings from the Copermittees' receiving water monitoring,

(d) Findings from the Copermittees' MS4 outfall discharge and receiving water assessments, and

(e) Other available, relevant, and appropriately collected data, information, or studies related to pollutant sources and/or stressors that contribute to the highest priority water quality conditions as identified for Provision B.2.c.

(5) The adequacy of the available data to identify and prioritize sources and/or stressors associated with MS4 discharges that cause or contribute to the highest priority water quality conditions identified under Provision B.2.c.

e. NUMERIC GOALS AND SCHEDULES

Comment [A25]: See discussion in section 3.3.2 of the comment letter.

The Copermittees must develop and incorporate action levels, interim and final numeric goals[6] and schedules into the Water Quality Improvement Plan. Numeric goals must be used to support Water Quality Improvement Plan implementation and measure progress towards addressing the highest priority water quality conditions identified under Provision B.2.c. . Action Levels, Numeric goals are not enforceable compliance standards, effluent limitations, or receiving water limitations. When establishing numeric goals and corresponding schedules, the Copermittees must consider the following:

(1) Final numeric goals must be based on measureable criteria or indicators, to be achieved in ~~the receiving waters and/or~~ MS4 discharges for the highest priority water quality conditions which will ~~be capable of demonstrating the achievement of the restoration and/or protection~~ comply with the Receiving Water Limitations (A.2) of this Order; ~~water quality standards in receiving waters;~~

(2) Interim numeric goals must be based on measureable criteria or indicators capable of demonstrating incremental progress toward achieving the final numeric goals in the receiving waters and/or MS4 discharges; and

(3) Schedules must be adequate for measuring progress toward achieving the interim and final numeric goals required for Provisions B.2.e.(1) and B.2.e.(2). Schedules must incorporate the following:

(a) Interim dates for achieving the interim numeric goals,

(b) Compliance schedules for any applicable TMDLs in Attachment E to this Order,

(c) Compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A),

(d) Achievement of the final numeric goals in the receiving waters and/or MS4 discharges for the highest water quality priorities must be as soon as possible, and

[6] Interim and final numeric goals may take a variety of forms such as TMDL established WQBELs, action levels, pollutant concentration, load reductions, number of impaired water bodies delisted from the List of Water Quality Impaired Segments, Index of Biotic Integrity (IBI) scores, or other appropriate metrics. Interim and final numeric goals are not necessarily limited to one criterion or indicator, but may include multiple criteria and/or indicators. Except for TMDL established WQBELs, interim and final numeric goals and corresponding schedules may be revised through the adaptive management process under Provision B.5.

(e) Final dates for achieving the final numeric goals must not initially extend more than 10 years beyond the effective date of this Order, unless a longer period of time is authorized by the San Diego Water Board Executive Officer through an approved WQIP or the schedule includes an applicable TMDL in Attachment E to this Order[7].

Comment [A26]: Clarify that a longer period can be granted through the WQIP process.

[7] Achievement of final numeric goals within 10 years represents progress towards attainment of water quality standards, but is not a requirement to fully attain all applicable water quality standards or all priority receiving water conditions within 10 years.

3. Water Quality Improvement Strategies and Schedules

Comment [A27]: See discussion in section 3.3.2 of the comment letter.

The Copermittees must develop specific water quality improvement strategies to address the highest priority water quality conditions identified within a Watershed Management Area. The water quality improvement strategies must address the highest priority water quality conditions by ensuring the effective prohibition of~~preventing or eliminating~~ non-storm water discharges to and from the MS4, reducing pollutants in ~~storm water~~ discharges from the MS4 to the MEP, as applicable to the priority water quality conditions established per provision B.2. ~~and restoring and/or protecting the water quality standards of receiving waters~~.

a. Water Quality Improvement Strategies

The Copermittees must identify and prioritize water quality improvement strategies based on their likely effectiveness and efficiency, and design the JRMP programs to focus resources on those strategies to~~implement strategies to effectively prohibit non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, improve the physical, chemical, and biological receiving water conditions, and~~ achieve the interim and final numeric goals in accordance with the schedules required for Provision B.2.e.(3). The following water quality improvement strategies must be included and described in the Water Quality Improvement Plan:

(1) Specific strategies and/or activities that may be implemented by one or more Copermittees within their jurisdictions through the jurisdictional runoff management programs that will address the highest priority water quality conditions within the Watershed Management Area, in accordance with the following requirements:

(a) Strategies and/or activities must, at a minimum, be described for each jurisdictional runoff management program component where strategies to address the highest priority water quality conditions are required under Provision E;

(b) The Water Quality Improvement Plan must describe the circumstances or conditions when and where the strategies or/activities should be or will be implemented, but specific details about how each Copermittee will implement the strategies and/or activities within its jurisdiction are not required; and

(c) Descriptions of strategies and/or activities must include any monitoring, information collection, special studies, and/or data analysis that is necessary to assess the effectiveness of the strategy and/or activity toward addressing the highest priority water quality conditions.

(2) Additional strategies and/or activities that may be implemented within the Watershed Management Area on a jurisdictional, sub-watershed, or watershed scale by one or more Copermittees, not specifically required under

Provision E, which are designed to achieve the interim and final numeric goals identified in Provisions B.2.e.(1) and B.2.e.(2);

b. IMPLEMENTATION SCHEDULES

(1) The Copermittees must develop schedules for implementing the water quality improvement strategies identified under Provision B.3.a to achieve the interim and final numeric goals identified under Provision B.2.e.(1) and B.2.e.(2). Schedules must be developed for both the water quality improvement strategies implemented by each Copermittee within its jurisdiction and for strategies that the Copermittees choose to implement on a collaborative basis.

(2) The Copermittees must incorporate the implementation compliance schedules for any ASBS subject to the provisions of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A).

4. Water Quality Improvement Monitoring and Assessment Program

a. The Copermittees in each Watershed Management Area must develop and incorporate an integrated monitoring and assessment program into the Water Quality Improvement Plan that assesses: 1) the progress toward achieving the numeric goals and schedules, 2) the progress toward addressing the highest priority water quality conditions for each Watershed Management Area, and 3) each Copermittee's overall efforts to implement the Water Quality Improvement Plan.

b. The monitoring and assessment program must incorporate the monitoring and assessment requirements of Provision D, which may allow the Copermittees to modify the program to be consistent with and focus on the highest priority water quality conditions for each Watershed Management Area.

c. For Watershed Management Areas with applicable TMDLs, the monitoring and assessment program must incorporate the specific monitoring and assessment requirements of Attachment E.

d. For Watershed Management Areas with any ASBS, the water quality monitoring and assessment program must incorporate the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012 (see Attachment A).

5. Iterative Approach and Adaptive Management Process

Comment [A28]: See discussion in section 3.3.2 of the comment letter.

The Copermittees in each Watershed Management Area must implement the iterative approach pursuant to Provision A.4 to adapt the Water Quality Improvement Plan, monitoring and assessment program, and jurisdictional runoff management programs to become more effective toward achieving compliance with Provisions A.1, A.2, and A.3.~~A.1.a, A.1.c and A.2.a~~, and must include the following:

a. RE-EVALUATION OF PRIORITY WATER QUALITY CONDITIONS

The priority receiving water quality conditions, and numeric goals and corresponding schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.2.c and B.2.e, may be re-evaluated by the Copermittees as needed during the term of this Order as part of the Annual Report. Re-evaluation and recommendations for modifications to the priority water quality conditions, and numeric goals and corresponding schedules must be provided in the Regional Monitoring and Assessment Report pursuant to F.3.c~~Report of Waste Discharge~~, and must consider the following:

(1) Achieving the outcome of improved water quality in MS4 discharges and receiving waters through implementation of the water quality improvement strategies identified in the Water Quality Improvement Plan;

(2) Progress toward achieving interim and final numeric goals in receiving waters and/or MS4 discharges for the highest priority water quality conditions in the Watershed Management Area,

(3) Progress toward achieving outcomes according to established schedules;

(4) New information developed when the requirements of Provisions B.2.a-c have been re-evaluated;

(5) New policies or regulations that may affect identified numeric goals;

(6) Spatial and temporal accuracy of monitoring data collected to inform prioritization of water quality conditions and implementation strategies to address the highest priority water quality conditions;

(7) Availability of new information and data from sources other than the jurisdictional runoff management programs within the Watershed Management Area that informs the effectiveness of the actions implemented by the Copermittees;

(8) San Diego Water Board recommendations; and

(9) Recommendations for modifications solicited through a public participation process.

b. ADAPTATION OF STRATEGIES AND SCHEDULES

The water quality improvement strategies and schedules, included in the Water Quality Improvement Plan pursuant to Provisions B.3, must be re-evaluated and adapted as new information becomes available to result in more effective and efficient measures to achieve the numeric goals established pursuant to

Provision B.2.e. Re-evaluation of and modifications to the water quality improvement strategies, if determined to be necessary, must be provided in the applicable Annual Report per F.3.b.(3)., and must consider the following:

(1) Modifications to the priority water quality conditions, and numeric goals and corresponding schedules based on Provision B.5.a;

(2) Measurable or demonstrable reductions of non-storm water discharges to and from each Copermittee's MS4;

(3) Measurable or demonstrable reductions of pollutants in ~~storm water~~ discharges from each Copermittee's MS4 to the MEP;

(4) New information developed when the requirements of Provisions B.2.b and B.2.d have been re-evaluated;

(5) Efficiency in implementing the Water Quality Improvement Plan;

(6) San Diego Water Board recommendations; and

(7) Recommendations for modifications solicited through a public participation process.

c. ADAPTATION OF MONITORING AND ASSESSMENT PROGRAM

The water quality improvement monitoring and assessment program, included in the Water Quality Improvement Plan pursuant to Provisions B.4, must be re-evaluated and adapted when new information becomes available. Re-evaluation and recommendations for modifications to the monitoring and assessment program, pursuant to the requirements of Provision D, may be provided in the Annual Report, but must be provided in the Report of Waste Discharge.

6. Water Quality Improvement Plan Submittal, Updates, and Implementation

a. The Copermittees must submit the Water Quality Improvement Plans in accordance with the requirements of Provision F.1.

b. The Copermittees must submit proposed updates to the Water Quality Improvement Plan for acceptance by the San Diego Water Board Executive Officer in accordance with the requirements of Provision F.2.c.

c. The Copermittees must commence with implementation of the Water Quality Improvement Plans ~~immediately after acceptance by the San Diego Water Board, in accordance with the schedules, or subsequently updated schedules, within the Water Quality Improvement Plan.~~in accordance with Provision F.1.b.(5).

April 10 and 11, 2013
Item No. 8
Supporting Document No. 5

C. ACTION LEVELS

Comment [A29]: See comment letter section 3.4 for a discussion of the redlines shown herein.

The purpose of this provision is for the Copermittees to incorporate numeric non-stormwater action levels (NALs) and stormwater action levels (SALs) in the Water Quality Improvement Plans (Provision B), and numeric non-stormwater action levels (NALs) in the Illicit Discharge Detection and Elimination (IDDE) program (Provision E.2.).

- For the purposes of the WQIPs, ~~T~~the goal of the action levels is to guide ~~Water Quality Improvement Plan~~ the implementation efforts and measure progress towards the protection of the identified high priority water quality conditions and associated designated beneficial uses of waters of the state from adverse impacts caused or contributed to by MS4 discharges. This goal will be accomplished through monitoring and assessing the quality of the MS4 discharges during the implementation of the Water Quality Improvement Plans.

- For the purposes of the IDDE program, the goal of the non-stormwater action levels is to assist in determining whether a persistent non-stormwater discharge into or from the MS4 contains pollutants at levels that have the potential to negatively affect the identified high priority water quality conditions.

Action levels will be developed and incorporated into the WQIP (Provision B) and the IDDE Program (Provision E). Depending upon the goals/objectives for the use of the action levels and the priority receiving water conditions, the constituents and values at which they are set may differ between watersheds. Copermittees may develop Watershed Management Area specific numeric action levels for non-stormwater and stormwater MS4 discharges using an approach approved by the Regional Board or use the default non-stormwater and stormwater action levels prescribed in C.1 and C.2 below.

The Copermittees will submit the action levels as a part of the WQIP and JRMP submittals. The action levels currently established will serve as the interim action levels until revised action levels are completed and approved. Exceedances of the action levels are not subject to enforcement or non-compliance actions under this Order.

1. Default Non-Storm Water Action Levels[8]

~~The Copermittees must develop and incorporate numeric non-storm water action levels (NALs) into the Water Quality Improvement Plan to: 1) support the development and prioritization of water quality improvement strategies for addressing non-storm water discharges to and from the MS4s, 2) assess the effectiveness of the water quality improvement strategies toward addressing MS4~~

Comment [A30]: As discussed in section 2.4 of the Riverside comment letter.

[8] NALs are not ~~considered by the San Diego Water Board to be~~ enforceable limitations under this Order.

~~non-storm water discharges, required pursuant to Provision D.4.b.(1), and 3) support the detection and elimination of non-storm water and illicit discharges to and from the MS4, required pursuant to Provision E.2.~~[9]

a. The following NALs must be incorporated as applicable to the WMA and the Copermittees' MS4 discharges.~~:~~ if the Copermittees do not establish numeric action levels within the WQIP based on watershed priorities:

(1) Non-Storm Water Discharges from MS4s to Ocean Surf Zone

Table C-1. Non-Storm Water Action Levels for Discharges from MS4s to Ocean Surf Zone

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000/1,000[1]	OP
Fecal Coliform	MPN/100 ml	200[2]	-	400	OP
Enterococci	MPN/100 ml	35	-	104[3]	OP

Abbreviations/Acronyms
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
MPN/100 ml – most probable number per 100 milliliters

Notes:
1. Total coliform density NAL is 1,000 MPN/100 ml when the fecal/total coliform ratio exceeds 0.1.
2. Fecal coliform density NAL is 200 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas."

~~[9] The Copermittees may utilize NALs or other benchmarks currently established by the Copermittees as interim NALs until the Water Quality Improvement Plans are accepted by the San Diego Water Board Executive Officer.~~

(2) Non-Storm Water Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Table C-2. Non-Storm Water Action Levels for Discharges from MS4s to Bays, Harbors, and Lagoons/Estuaries

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Turbidity	NTU	75	-	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times			OP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	35	-	104[3]	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
MDAL – maximum daily action level
OP – Ocean Plan water quality objective
BP – Basin Plan water quality objective
NTU – Nephelometric Turbidity Units
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for saltwater "designated beach areas" and is not applicable to waterbodies that are not designated with the water contact recreation (REC-1) beneficial use.

Table C-3. Non-Storm Water Action Levels for Priority Pollutants

Parameter	Units	Freshwater (CTR)		Saltwater (CTR)	
		MDAL	AMAL	MDAL	AMAL
Cadmium	ug/L	**	**	16	8
Copper	ug/L	*	*	5.8	2.9
Chromium III	ug/L	**	**	-	-
Chromium VI	ug/L	16	8.1	83	41
Lead	ug/L	*	*	14	2.9
Nickel	ug/L	**	**	14	6.8
Silver	ug/L	*	*	2.2	1.1
Zinc	ug/L	*	*	95	47

Abbreviations/Acronyms:
CTR – California Toxic Rule
ug/L – micrograms per liter
AMAL – average monthly action level
MDAL – maximum daily action level

Notes:
* Action levels developed on a case-by-case basis (see below)
** Action levels developed on a case-by-case basis (see below), but calculated criteria are not to exceed Maximum Contaminant Levels (MCLs) under the California Code of Regulations, Title 22, Division 4, Chapter 15, Article 4, Section 64431

The Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc NALs for MS4 discharges to freshwater receiving waters will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, refer to ~~the following equations (~~40 CFR 131.38.b.2 for details~~) will be required~~:

~~Cadmium (Total Recoverable) = exp(0.7852[ln(hardness)] - 2.715)~~
~~Chromium III (Total Recoverable) = exp(0.8190[ln(hardness)] + 0.6848)~~
~~Copper (Total Recoverable) = exp(0.8545[ln(hardness)] - 1.702)~~
~~Lead (Total Recoverable) = exp(1.273[ln(hardness)] - 4.705)~~
~~Nickel (Total Recoverable) = exp(.8460[ln(hardness)] + 0.0584)~~
~~Silver (Total Recoverable) = exp(1.72[ln(hardness)] - 6.52)~~
~~Zinc (Total Recoverable) = exp(0.8473[ln(hardness)] + 0.884)~~

Comment [A31]: Consistent with SD Permittee recommendations.

(3) Non-Storm Water Discharges from MS4s to Inland Surface Waters

Table C-4. Non-Storm Water Action Levels for Discharges from MS4s to Inland Surface Waters

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters			BP
Turbidity	NTU	-	20	See MDAL	BP
pH	Units	Within limit of 6.5 to 8.5 at all times			BP
Fecal Coliform	MPN/100 ml	200[1]	-	400[2]	BP
Enterococci	MPN/100 ml	33	-	61[3]	BP
Total Nitrogen	mg/L	-	1.0	See MDAL	BP
Total Phosphorus	mg/L	-	0.1	See MDAL	BP
MBAS	mg/L	-	0.5	See MDAL	BP
Iron	mg/L	-	0.3	See MDAL	BP
Manganese	mg/L	-	0.05	See MDAL	BP
Priority Pollutants	ug/L	See Table C-3			

Abbreviations/Acronyms:
AMAL – average monthly action level
BP – Basin Plan water quality objective
COLD – cold freshwater habitat beneficial use
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
MDAL – maximum daily action level
WARM – warm freshwater habitat beneficial use
MBAS – Methylene Blue Active Substances
MPN/100 ml – most probable number per 100 milliliters
ug/L – micrograms per liter

Notes:
1. Based on a minimum of not less than five samples for any 30-day period.
2. The NAL is reached if more than 10 percent of total samples exceed 400 MPN per 100 ml during any 30 day period.
3. This value has been set to the Basin Plan water quality objective for freshwater "designated beach areas" and is not applicable to waterbodies that are not designated with the water contact recreation (REC-1) beneficial use.

b. NALs must be identified, developed and incorporated in the Water Quality Improvement Plan for any pollutants or waste constituents that cause or contribute, or are threatening to cause or contribute to a condition of pollution or nuisance in Receiving waters ~~of the state~~ associated with the highest priority water quality conditions related to non-storm water discharges from the MS4s. NALs must be based on:

(1) Applicable water quality standards which may be dependent upon site-specific or receiving water-specific conditions or assumptions to be identified by the Copermittees; or

(2) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. ~~For the NALs incorporated into the Water Quality Improvement Plan, the Copermittees may develop and incorporate secondary NALs specific to the Watershed Management Area at levels greater than the NALs required by Provisions C.1.a and C.1.b which can be utilized to further refine the prioritization and assessment of water quality improvement strategies for addressing non-~~

~~storm water discharges to and from the MS4s, as well as the detection and elimination of non-storm water and illicit discharges to and from the MS4. The secondary NALs may be developed using an approach acceptable to the San Diego Water Board.~~

d. Dry weather monitoring data from MS4 outfalls collected in accordance with Provision D.2.b may be utilized to develop or revise NALs based on watershed-specific data, subject to San Diego Water Board Executive Officer approval.

2. Default Storm Water Action Levels[10]

The Copermittees must develop and incorporate numeric storm water action levels (SALs) in the Water Quality Improvement Plans to: 1) support the development and prioritization of water quality improvement strategies for reducing pollutants in storm water discharges from the MS4s, and 2) assess the effectiveness of the water quality improvement strategies toward reducing pollutants in storm water discharges, required pursuant to Provision D.4.b.(2).[11]

a. The following SALs for discharges of storm water from the MS4 must be incorporated~~:~~ if the Copermittees do not establish stormwater action levels within the WQIP based on watershed priorities::~~:~~

Table C-5. Storm Water Action Levels for Discharges from MS4s to Receiving Waters

Parameter	Units	Action Level
Turbidity	NTU	126
Nitrate & Nitrite (Total)	mg/L	2.6
Phosphorus (Total P)	mg/L	1.46
Cadmium (Total Cd)*	µg/L	3.0
Copper (Total Cu)*	µg/L	127
Lead (Total Pb)*	µg/L	250
Zinc (Total Zn)*	µg/L	976

Abbreviations/Acronyms:
NTU – Nephelometric Turbidity Units
mg/L – milligrams per liter
ug/L – micrograms per liter

Notes:
* The sampling must include a measure of receiving water hardness at each MS4 outfall. If a total metal concentration exceeds the corresponding metals SAL in Table C-5, that concentration must be compared to the California Toxics Rule criteria and the USEPA 1-hour maximum concentration for the detected level of receiving water hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific metal exceeds that SAL, but does not exceed the applicable USEPA 1-hour maximum concentration criterion for the measured level of hardness, then the sample result will not be considered above the SAL for that measurement.

[10] SALs are not ~~considered by the San Diego Water Board to be~~ enforceable limitations under this Order.
[11] The Copermittees may utilize SALs or other benchmarks currently established by the Copermittees as interim SALs until the Water Quality Improvement Plans are accepted by the San Diego Water Board Executive Officer.

b. SALs must be identified, developed and incorporated in the Water Quality Improvement Plan for pollutants or waste constituents that cause or contribute, or are threatening to cause or contribute to a condition of pollution or nuisance in Receiving waters ~~of the state~~ associated with the highest water quality priorities related to storm water discharges from the MS4s. SALs must be based on:

(1) Federal and State water quality guidance and/or water quality standards; and

(2) Site-specific or receiving water-specific conditions; or

(3) Applicable numeric WQBELs required to meet the WLAs established for the TMDLs in Attachment E to this Order.

c. ~~For the SALs incorporated into the Water Quality Improvement Plan, the Copermittees may develop and incorporate secondary SALs specific to the Watershed Management Area at levels greater than the SALs required by Provisions C.2.a and C.2.b which can be utilized to further refine the prioritization and assessment of water quality improvement strategies for reducing pollutants in storm water discharges from the MS4s. The secondary SALs may be developed based on the approaches recommended by the State Water Board's Storm Water Panel[12] or using an approach acceptable to the San Diego Water Board.~~

d. Wet weather monitoring data from MS4 outfalls collected in accordance with Provision D.2.c may be used to develop or revise SALs based upon watershed-specific data, subject to San Diego Water Board Executive Officer approval.

~~[12] Storm Water Panel Recommendations to the California State Water Resources Control Board: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 2006)~~

D. MONITORING AND ASSESSMENT PROGRAM REQUIREMENTS

Comment [A32]: See discussion in section 3.5 of the comment letter.

The purpose of this provision is for the Copermittees to monitor and assess the impact on the chemical, physical, and biological conditions of receiving waters caused by discharges from the Copermittees' MS4s under wet weather and dry weather conditions. The goal of the monitoring and assessment program is to inform the Copermittees about the nexus between the health of receiving waters and the water quality condition of the discharges from their MS4s to those receiving waters.~~.~~ This goal will be accomplished through monitoring and assessing the conditions of the receiving waters, discharges from the MS4s to those receiving waters, pollutant sources and/or stressors, and effectiveness of the water quality improvement strategies implemented as part of the Water Quality Improvement Plans.

1. Receiving Water Monitoring Requirements

The Copermittees must develop and conduct a program to monitor the condition of the receiving waters in each Watershed Management Area during dry weather and wet weather. Following acceptance of the Water Quality Improvement Plans for each Watershed Management Area, the Copermittees must conduct long-term receiving water monitoring during implementation of the Water Quality Improvement Plan to assess the long term trends and determine if water quality conditions in receiving waters are improving. Any available monitoring data not collected specifically for this Order that meet the quality assurance criteria of the Copermittees and the monitoring requirements of this Order may be utilized by the Copermittees. The Copermittees must conduct the following receiving water monitoring procedures:

a. TRANSITIONAL RECEIVING WATER MONITORING

Beginning October 1st or May 1st (whichever is sooner) following enrollment under this order and until~~Until~~ the monitoring requirements of Provisions D.1.b-e are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following receiving water monitoring in the Watershed Management Area:

(1) Continue the receiving water monitoring programs required in Order Nos. R9-2007-0001~~,~~ (Attachment A, Section II. A. 1-5),~~,~~ R9-2009-0002, and R9-2010-0016;

(2) Continue the monitoring in the Hydromodification Management Plans approved by the San Diego Water Board;

(3) Participate in the following regional receiving water monitoring programs, as applicable to the Watershed Management Area and each Copermittees' MS4 discharges:

Comment [A33]: See discussion in section 3.5.3 of the comment letter.

(a) Storm Water Monitoring Coalition Regional Monitoring,

(b) Southern California Bight Regional Monitoring, and

(c) Sediment Quality Monitoring;

(4) Implement the monitoring programs developed as part of any implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) for the TMDLs in Attachment E to this Order; and

(5) For Watershed Management Areas with ASBS, implement the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012, included in Attachment A to this Order.

b. LONG-TERM RECEIVING WATER MONITORING STATIONS

The Copermittees must select at least one long-term receiving water monitoring station from among the existing mass loading stations, temporary watershed assessment stations, bioassessment stations, and stream assessment stations previously established by the Copermittees to be representative of the receiving water quality in the Watershed Management Area. Additional or alternative long-term receiving water monitoring stations may~~must~~ be selected where necessary to support the implementation and adaptation of the Water Quality Improvement Plan.

Comment [A34]: See discussion in section 3.5.3 of the comment letter.

c. DRY WEATHER RECEIVING WATER MONITORING

During the term of the Order, the Copermittees must perform monitoring during at least three dry weather monitoring events at each of the long-term receiving water monitoring stations. At least one monitoring event must be conducted during the dry season (May 1 – September 30) and at least one monitoring event must be conducted during a dry weather period during the wet season (October 1 – April 30), after the first wet weather event of the season, with an antecedent dry period of at least 72 hours following a storm event producing measureable rainfall of greater than 0.1 inch.

(1) Dry Weather Receiving Water Field Observations

For each dry weather monitoring event, the Copermittees must record field observations consistent with Table D-1 at each long-term receiving water monitoring station.

Table D-1. Field Observations for Receiving Water Monitoring Stations

Field Observations
• Station identification and location • Presence of flow, or pooled or ponded water • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate) - Flow characteristics (i.e. presence of floatables, surface scum, sheens, odor, color) • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, sheens, odor, color) • Assessment of any observed connectivity of MS4 discharges to a flowing receiving water. • Station description (i.e. deposits or stains, vegetation condition, structural condition, and observable biology) • Presence and assessment of trash in and around station

Comment [A35]: See discussion in section 3.5.3 of the comment letter.

(2) Dry Weather Receiving Water Field Monitoring

For each dry weather monitoring event, if conditions allow the collection of the data, the Copermittees must monitor and record the parameters in Table D-2 at each long-term receiving water monitoring station.

Table D-2. Field Monitoring Parameters for Receiving Water Monitoring Stations

Parameters
• pH • Temperature • Specific conductivity • Dissolved oxygen • Turbidity

(3) Dry Weather Receiving Water Analytical Monitoring

For each dry weather monitoring event, the Copermittees must collect and analyze samples from each long-term receiving water monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria Grab samples may also be collected for the analyses described in (f) where MS4 discharge runoff constitutes less than ten percent of the flow;

Comment [A36]: The receiving water stations in Riverside County either do not receive runoff from MS4 discharges or receive deminimus flows during dry weather conditions. The flow at these stations during dry weather consists virtually entirely of rising groundwater. Background receiving water quality conditions In such cases composite samples of receiving waters not affected by MS4 discharges is not warranted.

(d) For all other constituents where runoff constitutes more than ten percent of the flow, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over a typical 24-hour period, which may be collected through the use of automated equipment;

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,

(iv) Applicable NAL constituents, and

(v) Constituents listed in Table D-3.

Table D-3. Analytical Monitoring Constituents for Receiving Water Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Pesticides	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity • Total Hardness • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus • Orthophosphate • Nitrite[1]	• Arsenic • Cadmium • Chromium • Copper • Iron • Lead • Mercury • Nickel • Selenium • Thallium • Zinc	• Organophosphate Pesticides • Pyrethroid Pesticides	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

• Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia			

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(4) Dry Weather Receiving Water Toxicity Monitoring

For each dry weather monitoring event, the Copermittees must collect grab or composite samples from each long-term receiving water monitoring station to be analyzed for toxicity in accordance with Table D-4:

Table D-4. Dry Weather Toxicity Testing for Receiving Water Monitoring Stations

Freshwater Organism	Test Approach	USEPA Protocol[2]
Pimephales promelas	1 acute 1 chronic[1]	EPA-821-R-02-012
Hyalella Azteca	1 acute 1 chronic[1]	EPA-821-R-02-012
Psuedokirchneriella subcapitata	1 acute 1 chronic[1]	EPA-821-R-02-013

Notes:
1. Chronic toxicity testing is not required at receiving water monitoring stations located at mass loading stations if the channel flows are diverted year-round during dry weather conditions to the sanitary sewer for treatment.
2. USEPA protocols must be utilized for toxicity testing unless alternate toxicity testing protocols have been approved by the San Diego Water Board.

(5) Dry Weather Receiving Water Bioassessment Monitoring

Bioassessment monitoring for each long-term receiving water monitoring station is required at least once during the term of this Order. The Copermittees must conduct bioassessment monitoring during at least one dry weather monitoring event at each long-term receiving water monitoring station as follows:

(a) The following bioassessment samples and measurements must be collected:

(i) Macroinvertebrate samples must be collected in accordance with the "Reachwide Benthos (Multihabitat) Procedure" in the most current Surface Water Ambient Monitoring Program (SWAMP) Bioassessment Standard Operating Procedures (SOP), and amendments, as applicable;[13]

(ii) The "Full" suite of physical habitat characterization measurements

[13] Ode, P.R.. 2007. Standard operating procedures for collecting macroinvertebrate samples and associated physical and chemical data for ambient bioassessments in California. California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP) Bioassessment SOP 001. http://www.swrcb.ca.gov/water_issues/programs/swamp/tools.shtml#monitoring

must be collected in accordance with the most current SWAMP Bioassessment SOP, and as summarized in the SWAMP Stream Habitat Characterization Form – Full Version;[14] and

(iii) Freshwater algae samples must be collected in accordance with the SWAMP Standard Operating Procedures for Collecting Algae Samples.[15] Analysis of samples must include algal taxonomic composition (diatoms and soft algae) and algal biomass.

(b) The bioassessment samples, measurements, and appropriate water chemistry data must be used to calculate the following:

(i) An Index of Biological Integrity (IBI) for macroinvertebrates for each monitoring station where bioassessment monitoring was conducted, based on the most current calculation method;[16] and

(ii) An IBI for algae for each monitoring station where bioassessment monitoring was conducted, when a calculation method is developed.[17]

(c) In lieu of the requirements of Provision D.1.c.(5)(a), the Copermittees may conduct the bioassessment monitoring in accordance with the "Triad" assessment approach[18] to calculate the IBIs required for Provision D.1.c.(5)(b). The Copermittees must conduct sampling, analysis, and reporting of specified in-stream biological and habitat data according to the protocols specified in the SCCWRP Technical Report No. 539, or subsequent protocols, if developed.

(6) Dry Weather Receiving Water Hydromodification Monitoring

In addition to the hydromodification monitoring conducted as part of the Copermittees' Hydromodification Management Plans, hydromodification monitoring for each long-term receiving water monitoring station is required at least once during the term of this Order. The Copermittees must collect the

[14] Available at:
http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/fieldforms_fullversion052908.pdf
[15] Fetscher et al. 2009. Standard Operating Procedures for Collecting Stream Algae Samples and Associated Physical Habitat and Chemical Data for Ambient Bioassessments in California.
[16] The most current calculation method at the time the Order was adopted is outlined in "A Quantitative Tool for Assessing the Integrity of Southern California Coastal Streams" (Ode, et al. 2005. Environmental Management. Vol. 35, No. 1, pp. 1-13). If an updated or new calculation method is developed, either both (i.e. current and updated/new) methods must be used, or historical IBIs must be recalculated with the updated or new calculation method.
[17] When a calculation method is developed, IBIs must be calculated for all available and appropriate historical data.
[18] Stormwater Monitoring Coalition Model Monitoring Technical Committee, 2004. Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California. Technical Report #419. August 2004.

following hydromodification monitoring observations and measurements within an appropriate domain of analysis during at least one dry weather monitoring event for each long-term receiving water monitoring station:

(a) Channel conditions, including:

(i) Channel dimensions,

(ii) Hydrologic and geomorphic conditions, and

(iii) Presence and condition of vegetation and habitat;

(b) Location of discharge points;

(c) Habitat integrity;

(d) Photo documentation of existing erosion and habitat impacts, with location (i.e. latitude and longitude coordinates) where photos were taken;

(e) Measurement or estimate of dimensions of any existing channel bed or bank eroded areas, including length, width, and depth of any incisions; and

(f) Known or suspected cause(s) of existing downstream erosion or habitat impact, including flow, soil, slope, and vegetation conditions, as well as upstream land uses and contributing new and existing development.

d. WET WEATHER RECEIVING WATER MONITORING

During the term of the Order, the Copermittees must perform monitoring during at least three wet weather monitoring events at each long-term receiving water monitoring station. At least one wet weather monitoring event must be conducted during the first wet weather event of the wet season (October 1 – April 30), and at least one wet weather monitoring event during a wet weather event that occurs after February 1.

(1) Wet Weather Receiving Water Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each long-term receiving water monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(b) The flow rates and volumes measured or estimated (data from nearby

USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and

(d) Presence and assessment of trash in and around station.

(2) Wet Weather Receiving Water Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each long-term receiving water monitoring station.

(3) Wet Weather Receiving Water Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each long-term receiving water monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria;

(d) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over the length of the storm event or a typical 24-hour period, which may be collected through the use of automated equipment;

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,

(iv) Applicable SAL constituents, and

(v) Constituents listed in Table D-3.

(4) Wet Weather Receiving Water Toxicity Monitoring

For each wet weather monitoring event, the Copermittees must collect grab or composite samples from each long-term receiving water monitoring station to be analyzed for toxicity in accordance with Table D-5:

Table D-5. Wet Weather Toxicity Testing for Receiving Water Monitoring Stations

Freshwater Organism	Test Approach	USEPA Protocol[1]
Pimephales promelas	1 acute	EPA-821-R-02-012
Hyalella Azteca	1 acute	EPA-821-R-02-012
Psuedokirchneriella subcapitata	1 acute	EPA-821-R-02-013

Notes:
1. USEPA protocols must be utilized for toxicity testing unless alternate toxicity testing protocols have been approved by the San Diego Water Board.

e. OTHER RECEIVING WATER MONITORING REQUIREMENTS

(1) Regional Monitoring

The Copermittees must participate in the following regional receiving waters monitoring programs, as applicable to the Watershed Management Area and the Copermittee's MS4 discharges:

(a) Storm Water Monitoring Coalition Regional Monitoring; and

(b) Southern California Bight Regional Monitoring.

(2) Sediment Quality Monitoring

The applicable Copermittees must perform sediment monitoring to assess compliance with sediment quality receiving water limits applicable to MS4 discharges to enclosed bays and estuaries. The monitoring may be performed either by individual or multiple affected Copermittees to assess compliance with receiving water limits, or through participation in a water body monitoring coalition. The Copermittees must identify sediment sampling stations that are spatially representative of the sediment within the water body segment or region of interest. Sediment quality monitoring must be conducted in conformance with the monitoring requirements set forth in the State Water Board Sediment Quality Control Plan.

(3) ASBS Monitoring

For Watershed Management Areas with ASBS, the applicable Copermittees must implement the monitoring requirements of Attachment B to State Water Board Resolution No. 2012-0012, included in Attachment A to this Order.

f. ALTERNATIVE WATERSHED MONITORING REQUIREMENTS

The San Diego Water Board may direct the Copermittees to participate in an effort to develop alternative watershed monitoring with other regulated entities, other interested parties, and the San Diego Water Board to refine, coordinate, and implement regional monitoring and assessment programs to determine the status and trends of water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and/or 3) streams. As directed by the San Diego Water Board, such alternative watershed monitoring would be done in place and stead of the commensurate requirements set forth in Provision D.1.

2. MS4 Outfall Discharge Monitoring Requirements

The Copermittees must develop and conduct a program to monitor the discharges from the major MS4 outfalls to receiving waters in each Watershed Management Area during dry weather and wet weather. Following acceptance of the Water Quality Improvement Plans and schedule for implementation of monitoring for each Watershed Management Area, the Copermittees must conduct MS4 outfall discharge monitoring during implementation of the Water Quality Improvement Plan to assess the effectiveness of their jurisdictional runoff management programs toward effectively prohibiting non-storm water discharges into the MS4 and reducing pollutants in ~~storm water~~ discharges ~~to and~~ from their MS4s to the MEP. Any available monitoring data not collected specifically for this Order that meet the quality assurance criteria of the Copermittees and the monitoring requirements of this Order may be utilized by the Copermittees. The Copermittees must conduct the following MS4 outfall monitoring procedures:

Comment [A37]: Suggest same edits for SD and OC.

a. TRANSITIONAL MS4 OUTFALL DISCHARGE MONITORING

Beginning October 1st or May 1st (whichever is sooner) following enrollment under this order and until~~Until~~ the monitoring requirements of Provisions D.2.b-c are incorporated into a Water Quality Improvement Plan and schedule for implementation of monitoring that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following monitoring of MS4 outfall discharges to flowing receiving waters ~~monitoring~~ in the Watershed Management Area:

(1) MS4 Outfall Discharge Monitoring Station Inventory

Each Municipal Copermittee must identify all major MS4 outfalls (including those operated by a Special District Copermittee) that discharge directly to receiving waters within its jurisdiction and geo-locate those outfalls on a map of the MS4 pursuant to Provision E.2.b.(1). This information must be compiled into a MS4 outfall discharge monitoring station inventory, and must include the following information:

(a) Latitude and longitude of MS4 outfall point of discharge;

(b) Watershed Management Area;

(c) Hydrologic subarea;

(d) Outlet size;

(e) Accessibility (i.e. safety and without disturbance of critical habitat);

(f) Approximate drainage area; and

(g) Classification of whether the MS4 outfall is known to have persistent dry weather flows, transient dry weather flows, no dry weather flows, or unknown dry weather flows.

(2) Transitional Dry Weather MS4 Outfall ~~Discharge~~ Field Screening ~~Monitoring~~

Until the monitoring requirements of Provision D.2.b are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, each Municipal Copermittee must perform the following dry weather MS4 outfall field screening monitoring to identify non-storm water and illicit discharges being discharged from MS4s within its jurisdiction in accordance with Provision E.2.c, to determine which discharges are transient ~~flows~~ and which are persistent discharges to flowing receiving waters~~flows~~, and prioritize the dry weather MS4 discharges that will be investigated and eliminated in accordance with Provision E.2.d. ~~Each Copermittee must conduct the following dry weather MS4 outfall discharge field screening monitoring within its jurisdiction:~~

Comment [A38]: Suggested change of title to better characterize the requirements of this section, compared to that of D.2.b.

Comments in this section are discussed in section 3.5.3 of the comment letter.

Comment [A39]: Duplicative of previous sentence

(a) Transitional Dry Weather MS4 Outfall Discharge Field Screening Monitoring Frequency

Each Municipal Copermittee must field screen the accessible MS4 outfalls in its inventory developed pursuant to Provision D.2.a.(1) as follows:

(i) ~~For Copermittees with less than 125 major MS4 outfalls that discharge to receiving waters within a Watershed Management Area, at least 80 percent of the outfalls must be visually inspected two times per year during dry weather conditions.~~

(ii) For Municipal Copermittees with ~~125 major MS4 outfalls or more, but~~ less than or equal to 500 MS4 outfalls~~,~~ that discharge to receiving waters within a Watershed Management Area, ~~all~~ at least 80 percent of the accessible outfalls must be visually inspected at least annually during dry weather conditions.

(iii) For Municipal Copermittees with more than 500 major MS4 outfalls that discharge to receiving waters within a Watershed Management Area, at least 500 outfalls must be visually inspected at least annually during dry weather conditions. Copermittees with more than 500 major MS4 outfalls within a Watershed Management Area must identify and prioritize at least 500 outfalls to be inspected considering the following:

[a] Assessment of connectivity of the discharge to a flowing receiving water;
[b] Reported exceedances of NALs in water quality monitoring data;
[c] Surrounding land uses;
[d] Presence of constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List; and
[e] Flow rate.

(iv) Municipal Copermittees with more than 500 major MS4 outfalls within its jurisdiction that are located in more than one Watershed Management Area, at least 500 major MS4 outfalls within its inventory must be visually inspected at least annually during dry weather conditions. Copermittees with more than 500 major MS4 outfalls in more than one Watershed Management Area must identify and prioritize at least 500 outfalls to be inspected considering the following:

[a] Assessment of connectivity of the discharge to a flowing receiving water;
[b] Reported exceedances of NALs in water quality monitoring data;
[c] Surrounding land uses;

[d] Presence of constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List; and

[e] Flow rate.

(v) Inspections of major MS4 outfalls conducted in response to public reports and staff or contractor reports and notifications may count toward the required visual inspections of MS4 outfall discharge monitoring stations.

(b) Transitional Dry Weather MS4 Outfall Discharge Field Screening Visual Observations

(i) An antecedent dry period of at least 72 hours following any storm event producing measurable rainfall greater than 0.1 inch is required prior to conducting field screening visual observations during a field screening monitoring event.

(ii) During the field screening monitoring event, each Municipal Copermittee must record visual observations consistent with Table D-6 at each MS4 outfall discharge monitoring station inspected.

Table D-6. Field Screening Visual Observations for MS4 Outfall Discharge Monitoring Stations

Field Observations
• Station identification and location • Presence of flow, or pooled or ponded water • If flow is present: - Flow estimation (i.e. width of water surface, approximate depth of water, approximate flow velocity, flow rate) - Flow characteristics (i.e. presence of floatables, surface scum, sheens, odor, color) - Flow source(s) suspected or identified from non-storm water source investigation - Flow source(s) eliminated during non-storm water source identification • If pooled or ponded water is present: - Characteristics of pooled or ponded water (i.e. presence of floatables, surface scum, sheens, odor, color) - Known or suspected source(s) of pooled or ponded water • Assessment of any observed MS4 discharge ~~with~~ to a flowing receiving water. • Station description (i.e. deposits or stains, vegetation condition, structural condition, observable biology) • Presence and assessment of trash in and around station • Evidence or signs of illicit connections or illegal dumping

(iii) Each Municipal Copermittee must implement the requirements of Provisions E.2.d.(2)(c)-(e) based on the field observations.

(iv) Each Copermittee must evaluate field observations together with existing information available from prior reports, inspections and monitoring results to determine whether any observed flowing, pooled, or ponded waters are likely to be transient or persistent flow.[19]

Comment [A40]: See footnote edits

(c) Transitional Dry Weather MS4 Outfall Discharge Field Screening ~~Monitoring~~ Records

Based upon the results of the transitional dry weather MS4 outfall discharge field screening monitoring conducted pursuant to Provisions D.2.a.(2)(a)-(b), each Municipal Copermittee must update its MS4 outfall discharge monitoring station inventory, compiled pursuant to Provision D.2.a.(1), with any new information on the classification of whether the MS4 outfall produces persistent flow, transient flow, or no dry weather flow.

(3) Transitional Wet Weather MS4 Outfall Discharge Monitoring

Comment [A41]: See discussion in section 3.5.3 of the comment letter.

Until the monitoring requirements of Provision D.2.c are incorporated into a Water Quality Improvement Plan that is accepted by the San Diego Water Board pursuant to Provision F.1, the Copermittees must conduct the following wet weather MS4 outfall discharge monitoring within the Watershed Management Area:

(a) Transitional Wet Weather MS4 Outfall Discharge Monitoring Stations

The Copermittees must select at least five wet weather MS4 outfall discharge monitoring stations from the inventories developed pursuant to Provision D.2.a.(1) that are representative of storm water discharges from areas consisting primarily of residential, commercial, industrial, and typical mixed-use land uses present within the Watershed Management Area.

(b) Transitional Wet Weather MS4 Outfall Discharge Monitoring Frequency

Each wet weather MS4 outfall discharge monitoring station selected pursuant to Provision D.2.a.(3)(a) must be monitored twice during the wet season (October 1 – April 30)~~).~~) in the transitional period. The~~). One~~ wet weather monitoring ~~event~~events shall be selected to be representative of the range of hydrologic conditions experienced in the region. At least 10% of samples~~event~~ must be conducted during the first wet weather event of the wet season, ~~and~~to include~~and one wet weather monitoring event~~ at least one such sample in each Watershed Management Area~~, a month after the first wet weather event of the wet season.~~

[19] Persistent flow, for the purposes of provision II.D.2.b.(2) is defined as the presence of an MS4 discharge that is hydraulically connected to a flowing receiving~~, pooled, or ponded~~ water more than 72 hours after a measureable rainfall event of 0.1 inch or greater, during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient.

(c) Transitional Wet Weather MS4 Outfall Discharge Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded of the flow from~~at~~ each wet weather MS4 outfall discharge monitoring station:

(i) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and

(ii) The flow rates and volumes measured or estimated from the outfall (data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

(iii) ~~Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and~~

(iv) Presence ~~and assessment~~ of trash in and around station.

Comment [A42]: This isn't appropriate for a wet weather event.

Comment [A43]: This isn't appropriate for a wet weather event.

(d) Transitional Wet Weather MS4 Outfall Discharge Field Monitoring

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each wet weather MS4 outfall discharge monitoring station.

(e) Transitional Wet Weather MS4 Outfall Discharge Analytical Monitoring

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each wet weather MS4 outfall discharge monitoring station as follows:

(i) Analytes that are field measured are not required to be analyzed by a laboratory;

(ii) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(iii) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, and indicator bacteria;

(iv) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

[a] Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or
[b] Flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter, which may be collected through the use of automated equipment, or
[c] If automated compositing is not feasible, a composite sample may be collected using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours;

(v) Only one analysis of the composite of aliquots is required;

(vi) The samples must be analyzed for the following constituents:

[a] Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,
[b] Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order, and
[c] Constituents listed in in Table D-7.

Table D-7. Analytical Monitoring Constituents for Wet Weather MS4 Outfall Discharge Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Turbidity • Total Hardness • Total Organic Carbon • Dissolved Organic Carbon • Sulfate • Methylene Blue Active Substances (MBAS) • Total Phosphorus • Orthophosphate • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen • Ammonia	• Arsenic • Cadmium • Chromium • Copper • Iron • Lead • Nickel • Selenium • Thallium • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

(f) Other Transitional Wet Weather MS4 Outfall Discharge Monitoring

The San Diego County Copermittees must continue the wet weather MS4 outfall monitoring program developed under Order No. R9-2007-0001, as approved by the San Diego Water Board, through its planned completion.

b. DRY WEATHER MS4 OUTFALL DISCHARGE MONITORING

Each Municipal Copermittee must perform the following dry weather MS4 outfall monitoring within its jurisdiction to identify non-storm water and illicit discharges within its jurisdiction pursuant to Provision E.2.c, and to prioritize the dry weather MS4 discharges that will be investigated and eliminated pursuant to Provision E.2.d. ~~Each Copermittee must conduct the following dry weather MS4 outfall discharge monitoring within its jurisdiction:~~

(1) Dry Weather MS4 Outfall Discharge Field Screening Monitoring

Each Municipal Copermittee must continue to perform the dry weather MS4 outfall discharge field screening monitoring in accordance with the requirements of Provision D.2.a.(2), ~~. The~~ however the Municipal Copermittee may adjust the field screening monitoring frequencies and locations for the MS4 outfalls in its inventory, as needed, to identify and eliminate sources of persistent ~~flow~~ non-storm water illegal discharges from the MS4 to flowing receiving waters in accordance with the highest priority water quality conditions identified in the Water Quality Improvement Plan. ~~, provided the~~

Comment [A44]: Repetitive of previous sentence

Comment [A45]: See discussion in section 3.5.3 of the comment letter.

~~number of visual inspections performed is equivalent to the number of visual inspections required under Provision D.2.a.(2)(a).~~

Comment [A46]: See comments in comment letter

(2) Non-Storm Water Persistent Flow MS4 Outfall Discharge Monitoring

Each Municipal Copermittee must perform the following non-storm water monitoring of MS4 outfalls that persistently ~~flow MS4 outfall~~ discharge to flowing receiving waters ~~monitoring~~ to determine which persistent non-storm water discharges contain concentrations of pollutants below NALs, and which persistent non-storm water discharges impact receiving water quality during dry weather. ~~Each Copermittee must conduct the following non-storm water persistent flow MS4 outfall discharge monitoring within its jurisdiction:~~

Comment [A47]: Repetitive of previous sentence.

(a) Prioritization of Non-Storm Water Persistent Flow MS4 Outfalls

Based upon the dry weather MS4 outfall discharge field screening monitoring records developed pursuant to Provision D.2.a.(2)(c), each Municipal Copermittee must identify and prioritize the MS4 outfalls within its jurisdiction that have~~with~~ persistent discharges to flowing receiving waters ~~flows~~ based on the highest priority water quality conditions identified in the Water Quality Improvement Plan and any additional criteria developed by the Copermittee, which may include historical data and data from sources other than what the Copermittee collects.

(b) Non-Storm Water Persistent Flow MS4 Outfall Discharge Monitoring Frequency

Comment [A48]: See comment letter section 3.5.3

(i) Based on the prioritization of major MS4 outfalls developed under Provision D.2.b.(2)(a), each Municipal Copermittee must identify, at a minimum, the top 10 percent of the~~10~~ highest priority major MS4 outfalls with non-storm water persistent flows that the Copermittee will monitor within each Watershed Management Area within its jurisdiction, with a minimum of one persistent ~~flow~~discharge outfall, and a maximum of 5 required per WMA. The location of the selected highest priority non-storm water persistent ~~flow~~ discharge MS4 outfall monitoring stations must be identified on the map required pursuant to Provision E.2.b.(1).

(ii) Each of the highest priority non-storm water persistent flow MS4 outfall monitoring stations identified pursuant to Provision D.2.b.(2)(b)(i) must be monitored under dry weather conditions at least ~~semi-~~annually until one of the following occurs:

[a] The non-storm water discharges have been effectively eliminated (i.e. no flowing, pooled, or ponded water) for three consecutive dry weather monitoring events; or

[b] The source(s) of the persistent flows has been identified as a category of non-storm water discharges that does not require an NPDES permit and does not have to be addressed as an illicit discharge because it was not identified as a source of pollutants (i.e. constituents in non-storm water discharge do not exceed NALs), and the persistent flow can be re-prioritized to a lower priority; or

[c] The constituents in the persistent flow non-storm water discharge do not exceed NALs, and the persistent flow can be re-prioritized to a lower priority; or

[d] The source(s) of the persistent flows has been identified as a non-storm water discharge authorized by a separate NPDES permit.

(iii) Where the criteria under Provision D.2.b.(2)(c)(ii) are not met, but the threat to water quality has been reduced by the Copermittee, the highest priority persistent flow MS4 outfall monitoring stations may be reprioritized accordingly for continued dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.b.(1).

(iv) Each Municipal Copermittee must document removal or re-prioritization of the highest priority persistent flow MS4 outfall monitoring stations identified under Provision D.2.b.(2)(b) in the Annual Report. Persistent flow MS4 outfall monitoring stations that have been removed must be replaced with the next highest prioritized MS4 major outfall in the Watershed Management Area within its jurisdiction, unless there are no remaining qualifying major MS4 outfalls within the Copermittee's jurisdiction in the Watershed Management Area.

(c) Non-Storm Water Persistent Flow MS4 Outfall Discharge Field Observations

During each semi-annual monitoring event, each Municipal Copermittee must record field observations consistent with Table D-6 at each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction.

(d) Non-Storm Water Persistent Flow MS4 Outfall Discharge Field Monitoring

During each ~~semi-annual~~ monitoring event, if conditions allow the collection of the data, each Municipal Copermittee must monitor and record the parameters in Table D-2 at each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction.

(e) Non-Storm Water Persistent Flow MS4 Outfall Discharge Analytical Monitoring

Comment [A49]: See discussion in section 3.5.3 of the comment letter.

During each semi-annual monitoring event in which measurable flow from the MS4 outfall to a flowing receiving water is present, each Municipal Copermittee must collect and analyze samples from each of the highest priority persistent flow MS4 outfall monitoring stations within its jurisdiction as follows:

(i) Analytes that are field measured are not required to be analyzed by a laboratory;

(ii) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(iii) During development of the WQIP, for each WMA, consider the following sources to select constituents for collection of~~Collect~~ grab or composite samples to be analyzed at a qualified analytical laboratory::~~for the following constituents:~~

[a] Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,
[b] Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,
[c] Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order,
[d] Applicable NAL constituents, and
[e] Constituents listed in Table D-8, unless the Copermittee has historical data that can demonstrate or provide justification that the analysis of the constituent is not necessary.

(iv) Copermittees may adjust the analytical list for a given WMA in successive monitoring events to add or eliminate constituents based on data that can demonstrate or provide justification regarding need or lack of need for the analysis of specific constituents.

Table D-8. Analytical Monitoring Constituents for Persistent Flow MS4 Outfall Discharge Monitoring Stations

Conventionals, Nutrients	Metals (Total and Dissolved)	Indicator Bacteria
• Total Dissolved Solids • Total Suspended Solids • Total Hardness • Total Phosphorus • Orthophosphate • Nitrite[1] • Nitrate[1] • Total Kjeldhal Nitrogen	• Cadmium • Copper • Lead • Zinc	• Total Coliform • Fecal Coliform[2] • *Enterococcus*

• Ammonia		

Notes:
1. Nitrite and nitrate may be combined and reported as nitrite+nitrate.
2. *E. Coli* may be substituted for Fecal Coliform.

~~(iv)~~(v) If the Copermittee identifies and eliminates the source of the persistent flow non-storm water discharge, analysis of the sample is not required.

c. WET WEATHER MS4 OUTFALL DISCHARGE MONITORING

The Copermittees must perform wet weather MS4 outfall monitoring to identify sources areas of pollutants in ~~storm water~~ discharges from the MS4s in the Watershed Management Area. The Copermittees must conduct the following wet weather MS4 outfall discharge monitoring within the Watershed Management Area:

(1) Wet Weather MS4 Outfall Discharge Monitoring Stations

The Copermittees may adjust the wet weather MS4 outfall discharge monitoring locations and frequencies in the Watershed Management Area, as needed, to identify sources of pollutants in storm water discharges from MS4s in the Watershed Management Area in accordance with the highest priority water quality conditions identified in the Water Quality Improvement Plan, provided the number of stations is at least equivalent to the number of stations required under Provision D.2.a.(3)(a).

(2) Wet Weather MS4 Outfall Discharge Monitoring Frequency

The Copermittees must monitor the wet weather MS4 outfall discharge monitoring stations in the Watershed Management Area at an appropriate frequency to identify source areas of pollutants in ~~storm water~~ discharges from the MS4s causing or contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan.

(3) Wet Weather MS4 Outfall Discharge Field Observations

For each wet weather monitoring event, the following narrative descriptions and observations must be recorded at each wet weather MS4 outfall discharge monitoring station:

(a) A narrative description of the station that includes the location, date and duration of the storm event(s) sampled, rainfall estimates of the storm event, and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and

(b) The flow rates and volumes measured or estimated (data from nearby USGS gauging stations may be utilized, or flow rates may be measured or estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), section 3.2.1, or other method proposed by the Copermittees that is acceptable to the San Diego Water Board);

~~(c) Station condition (i.e. deposits or stains, vegetation condition, structural condition, observable biology); and~~

~~(d) Presence and assessment of trash in and around station.~~

Comment [A50]: These are inappropriate for wet weather observations.

(4) <u>Wet Weather MS4 Outfall Discharge Field Monitoring</u>

For each wet weather monitoring event, the Copermittees must monitor and record the parameters in Table D-2 at each wet weather MS4 outfall discharge monitoring station.

(5) <u>Wet Weather MS4 Outfall Discharge Analytical Monitoring</u>

For each wet weather monitoring event, the Copermittees must collect and analyze samples from each wet weather MS4 outfall discharge monitoring station as follows:

(a) Analytes that are field measured are not required to be analyzed by a laboratory;

(b) The Copermittees must implement consistent sample collection methods for regional comparability of data, unless site-specific conditions indicate the need for alternate methods;

(c) Grab samples may be collected for pH, temperature, specific conductivity, dissolved oxygen, turbidity, hardness, and indicator bacteria;

(d) For all other constituents, composite samples must be collected for a duration adequate to be representative of changes in pollutant concentrations and runoff flows using one of the following techniques:

(i) Time-weighted composites composed of 24 discrete hourly samples, which may be collected through the use of automated equipment, or

(ii) Flow-weighted composites collected over the length of the storm event or a typical 24 hour period, whichever is shorter, which may be collected through the use of automated equipment, or

(iii) If automated compositing is not feasible, a composite sample may be collected using a minimum of 4 grab samples, collected during the first 24 hours of the storm water discharge, or for the entire storm water discharge if the storm event is less than 24 hours.

(e) Only one analysis of the composite of aliquots is required;

(f) Analysis for the following constituents is required:

(i) Constituents contributing to the highest priority water quality conditions identified in the Water Quality Improvement Plan,

(ii) Constituents listed as a cause for impairment of receiving waters in the Watershed Management Area listed on the CWA section 303(d) List,

(iii) Constituents for implementation plans or load reduction plans (e.g. Bacteria Load Reduction Plans, Comprehensive Load Reduction Plans) developed for watersheds where the Copermittees are listed responsible parties under the TMDLs in Attachment E to this Order, and

(iv) Applicable SAL constituents.

3. Special Studies

Comment [A51]: See discussion in section 3.5.3 of the comment letter.

a. Within the term of this Order, the Copermittees must initiate~~develop and implement~~ the following special studies:

(1) At least two~~three~~ special studies in each Watershed Management Area to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that cause or contribute to highest priority water quality conditions identified in the Water Quality Improvement Plan.

(2) At least one~~two~~ special study~~studies~~ for the San Diego Region to address pollutant and/or stressor data gaps and/or develop information necessary to more effectively address the pollutants and/or stressors that are impacting receiving waters on a regional basis in the San Diego Region.

(3) One of the two~~three~~ special studies in each Watershed Management Area may be replaced by a special study implemented pursuant to Provision D.3.a.(2).

b. The special studies must, at a minimum, be in conformance with the following criteria:

(1) The special studies must be related to the highest priority water quality conditions identified by the Copermittees in the Watershed Management Area and/or for the entire San Diego Region;

(2) The special studies developed pursuant to Provision D.3.a.(1) must:

(a) Be implemented within the applicable Watershed Management Area, and

(b) Require some form of participation by all the Copermittees within the Watershed Management Area;

(3) The special studies developed pursuant to Provision D.3.a.(2) must:

(a) Be implemented within the San Diego Region, and

(b) Require some form of participation by all Copermittees covered under the requirements of this Order.

c. Special studies developed to identify sources of pollutants and/or stressors should be pollutant and/or stressor specific and based on historical monitoring data and monitoring performed pursuant to Provisions D.1 and D.2. Development of source identification special studies should include the following:

(1) A compilation of known information on the specific pollutant and/or stressor, including data on potential sources and movement of the pollutant and/or stressor within the watershed. Data generated by the Copermittees and others, as well as information available from a literature research on the pollutant and/or stressor should be compiled and analyzed as appropriate.

(2) An identification of data gaps, based on the compiled information generated on the specific pollutant and/or stressor in Provision D.3.d.(1). Source identification special studies should be developed to fill identified data gaps.

(3) A monitoring plan that will collect and provide data the Copermittees can utilize to do the following:

(a) Quantify the relative loading or impact of a pollutant and/or stressor from a particular source or pollutant generating activity;

(b) Improve understanding of the fate of a pollutant and/or stressor in the environment;

(c) Develop an inventory of known and suspected sources of a pollutant and/or stressor in the Watershed Management Area; and/or

(d) Prioritize known and suspected sources of a pollutant and/or stressor based on relative magnitude in discharges, geographical distribution (i.e., regional or localized), frequency of occurrence in discharges, human health risk, and controllability.

d. Special studies initiated prior to the term~~acceptance~~ of ~~the~~this Order~~the Water Quality Improvement Plan~~ that meet the requirements of Provision D.3.b and are implemented~~completed~~ during the term of this Order may be utilized to fulfill the special study requirements of Provision D.3.a.

e. The Copermittees must submit the monitoring plans for the special studies in the Water Quality Improvement Plans required pursuant to Provision F.1.

f. The Copermittees are encouraged to share the results of the special studies regionally among the Copermittees to provide information useful in improving and adapting the management of non-storm water and storm water runoff through the implementation of the Water Quality Improvement Plans.

4. Assessment Requirements

Each Copermittee must evaluate the data collected pursuant to Provisions D.1, D.2 and D.3, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E, to assess the progress of the water quality improvement strategies in the Water Quality Improvement Plan toward achieving compliance with Provisions A.1.a, A.1.c and A.2.a. Assessments must be performed as described in the following provisions:

a. RECEIVING WATERS ASSESSMENTS

(1) The Copermittees must assess and report the conditions of the receiving waters in the Watershed Management Area as follows:

(a) Based on data collected pursuant to Provision D.1.a, the assessments under Provision D.4.a.(2) must be included in the transitional~~first~~ Annual Report required pursuant to Provision F.3.b.(2~~1~~).

Comment [A52]: See our edits to that section

(b) Based on the data collected pursuant to Provisions D.1.a-e, the assessments required under Provision D.4.a.(2) must be included in the Report of Waste Discharge required pursuant to Provision F.5.b.

(2) The Copermittees must assess the status and trends of receiving water quality conditions in 1) coastal waters, 2) enclosed bays, harbors, estuaries, and lagoons, and 3) streams under dry weather and wet weather conditions, as those conditions are affected by discharges from the Copermittees' MS4, to determine the progress towards meeting interim or final goals of the Water Quality Implementation Plan for the Watershed Management Area~~.~~ For each of the three types of receiving waters that are present in each Watershed Management Area the applicable Copermittees must:

Comment [A53]: See discussion in section 3.5.3 of the comment letter.

(a) Determine whether or not the conditions of the receiving waters are meeting any applicable numeric goals established pursuant to provision B.2.e.~~protective of the designated beneficial uses~~;

~~(b) Identify the most critical beneficial uses that must be protected or restored to ensure overall health of the receiving water;~~

~~(c) Determine whether or not those critical beneficial uses are being protected and where those beneficial used must be restored;~~

~~(d)~~(b) Identify short-term and/or long-term improvements or degradation of Receiving Water conditions related to those numeric goals~~those critical beneficial uses~~;

~~(e)~~(c) Identify data gaps in the monitoring data necessary to assess Provisions D.4.a.(2)(a)-(d).

b. MS4 OUTFALL DISCHARGES ASSESSMENTS

(1) Non-Storm Water Discharges Reduction Assessments

(a) ~~Each Copermittee must assess and report the progress of its illicit discharge detection and elimination program, required to be implemented pursuant to Provision E.2, toward reducing and effectively prohibiting non-storm water and illicit discharges into the MS4 within its jurisdiction as follows:~~

~~(i) Based on data collected pursuant to Provisions D.2.a.(2), the assessments under Provision D.4.b.(1)(b) must be included when complete in the Annual Report required pursuant to Provision F.3.b.(1).~~

~~(ii) Based on the data collected pursuant to Provisions D.2.b, the assessments required under Provision D.4.b.(1)(c) must be included in the first Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter.~~

~~(iii) Based on the data collected pursuant to Provisions D.2.b, the assessment required under Provision D.4.b.(1)(c) must be included in the Report of Waste Discharge required pursuant to F.5.b.~~

(b) Based on the transitional dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.a.(2), each

Comment [A54]: See discussion in section 3.5.3 of the comment letter for key changes. Other changes are described in comments below.

Comment [A55]: For clarity and simplicity, these timelines were integrated into the following sections.

Municipal Copermittee must assess and report the following, as applicable to discharges from the MS4 (including Special District Copermittee MS4s) to flowing receiving waters within their jurisdiction, in the Annual Report required pursuant to Provision F.3.b.(2):~~:~~

Comment [A56]: Per edits to that section

(i) Identify the known and suspected controllable sources (e.g. facilities, areas, land uses, pollutant generating activities) of transient and persistent flow discharges to flowing receiving waters~~flows~~ within the Copermittee's jurisdiction in the Watershed Management Area;

(ii) Identify sources of transient and persistent flow discharges to flowing receiving waters~~flows~~ within the Copermittee's jurisdiction in the Watershed Management Area that have been reduced or eliminated; and

(iii) Identify modifications to the field screening monitoring locations and frequencies for the MS4 outfalls in its inventory necessary to identify and eliminate sources of persistent flow non-storm water discharges to flowing receiving waters, pursuant to Provision D.2.b.(1).

(c) Based on the dry weather MS4 outfall discharge field screening monitoring required pursuant to Provision D.2.b, each Municipal Copermittee must assess and report the following, as applicable to discharges from the MS4 (including Special District Copermittee MS4s) within their jurisdiction, in each Annual Report required pursuant to F.3.b.(3) and in the Report of Waste Discharge required pursuant to Provision F.5.b.:~~:~~

Comment [A57]: Per edits to that section

(i) The assessments required pursuant to Provision D.4.b.(1)(a~~b~~);

Comment [A58]: Per edits above

(ii) Based on the data collected and applicable NALs in the Water Quality Improvement Plan, rank the MS4 outfalls in the Copermittee's jurisdiction according to potential threat to receiving water quality, and produce a prioritized list of major MS4 outfalls for follow-up action to update the Water Quality Improvement Plan, with the goal of eliminating persistent flow non-storm water discharges to flowing receiving waters and/or pollutant loads in order of the ranked priority list through targeted programmatic actions and source investigations;

(iii) For the highest priority major MS4 outfalls with persistent flow discharges to a flowing receiving water~~flows~~ that are in exceedance of NALs, identify the known and suspected sources within the Copermittee's jurisdiction in the Watershed Management Area that may cause or contribute to the NAL exceedances;

(iv) Each Copermittee must analyze the data collected pursuant to Provision D.2.b.(2), and: ~~utilize a model or other method, to calculate or estimate the non-storm water volumes and pollutant loads collectively discharged from all the major MS4s outfalls in its jurisdiction identified as having persistent dry weather flows during~~

Comment [A59]: Edits to this section (and sub-sections) is different than SD edits.

~~the monitoring year. These calculations or estimates must be updated annually. Each Copermittee must calculate or estimate:~~

[a] Calculate or estimate annual non-storm water volumes and pollutant loads (associated with the priority constituents identified in the WQIP) collectively discharged from the monitored persistently flowing ~~Copermittee's~~ major MS4 outfalls discharging to flowing receiving waters within the Copermittee's jurisdiction, or discharged into another Copermittee's MS4 as demonstrated through provision E.2.d.~~with an estimate of the percent contribution from each known and suspected source for each MS4 outfall~~;

[b] Identify ~~identify~~ and quantify, where feasible, known sources of non-stormwater flows not ~~[b] Annual non-storm water volumes and pollutant loads from areas or facilities~~ subject to the Copermittee's legal authority that are discharged from the Copermittee's major MS4 outfalls to downstream receiving waters.

(v) Each Copermittee must review the data collected pursuant to Provision D.2.b and findings from the assessments required pursuant to Provision D.4.b.(1)(c)(i)-(iv) ~~once per Permit term~~~~on an annual basis, and then report~~ within the Regional Monitoring and Assessment Report per Provision F.3.c., the following ~~to~~:

[a] Identify reductions and progress in achieving reductions in non-storm water and illicit discharges to the Copermittee's MS4 in the Watershed Management Area;

[b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction, with an estimate, if possible, of the non-storm water volume and/or pollutant load reductions attributable to specific water quality strategies implemented by the Copermittee; and

[c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittee in the Watershed Management Area toward reducing or eliminating non-storm water and pollutant loads discharging from the MS4 to receiving waters within its jurisdiction.

(vi) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(v).

(2) Storm Water Pollutant Discharges Reduction Assessments

(a) ~~The Copermittees must assess and report the progress of the water quality improvement strategies, required to be implemented pursuant to~~

Comment [A60]: This is to help ensure jurisdictional accountability for what is being discharged from their jurisdiction.

~~Provisions B and E, toward reducing pollutants in storm water discharges from the MS4s within the Watershed Management Area as follows:~~

~~(i) Based on data collected pursuant to Provisions D.2.a.(3), the assessments under Provision D.4.b.(2)(b) must be included in the first Annual Report required pursuant to Provision F.3.b.(1).~~

~~Based on the data collected pursuant to Provisions D.2.c, the assessments required under ProvisionProvision first Annual Report required pursuant to Provision F.3.b.(1), and annually thereafter.~~

~~Based on the data collected pursuant to Provisions D.2.c, the assessment required under Provisions D.4.b.(2)(c)-(d) must be included in the Report of Waste Discharge required pursuant to F.5.b.~~

(b) Based on the transitional wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.a.(3) the Copermittees must assess and report the following in the Transitional Period Monitoring Report required pursuant to Provision F.3.b.(2):

(i) The Copermittees must analyze the monitoring data collected pursuant to Provision D.2.a.(3), and utilize a watershed model or other method, to calculate or estimate: ~~storm water volumes and pollutant loads discharged from the MS4s in each Copermittee's jurisdiction within the Watershed Management Area. The Copermittees must calculate or estimate the following for each monitoring year:~~

[a] The average storm water runoff coefficient for each land use type within the Watershed Management Area;

[b] The volume of storm water and pollutant loads discharged from each of the Copermittee's monitored major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each monitored storm event with measurable rainfall greater than 0.1 inch, for each of the priority water quality constituents identified in the WQIP;

[c] The total volume and pollutant loads potentially discharged from each Municipal Copermittee's jurisdiction within the watershed management area, for each monitored event, extrapolated from the data produced from the monitored outfalls.

~~The pollutant loads discharged from each of the Copermittee's major MS4 outfalls in its jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch; and~~

~~[d] The percent contribution of storm water volumes and pollutant loads discharged from each land use type within the drainage basin to each of the Copermittee's major MS4 outfalls in its~~

Comment [A61]: See discussion in section 3.5.3 of the comment letter.

Comment [A62]: Removed as this was confusing as it was duplicative of the subsections below.

Comment [A63]: There is no need to perform this analysis for other pollutants not identified as priorities in the WQIP.

~~jurisdiction to receiving waters within the Watershed Management Area for each storm event with measurable rainfall greater than 0.1 inch.~~

(ii) Identify modifications to the wet weather MS4 outfall discharge monitoring locations and frequencies necessary to identify ~~sources~~ pollutants in storm water discharges from the MS4s in the Watershed Management Area pursuant to Provision D.2.c.(1).

(c) Based on the wet weather MS4 outfall discharge monitoring required pursuant to Provision D.2.c the Copermittees must assess and report (i) and (ii) below in the annual reports required per F.3.b.(3), and (i) through (iv) below in the Regional Monitoring and Assessment Report required per F.3.c. ~~the following~~:

(i) The assessments required pursuant to Provision D.4.b.(2)(a~~b~~);

(ii) Based on the data collected and applicable SALs in the Water Quality Improvement Plan, analyze and compare the monitoring data to the analyses and assumptions used to develop the Water Quality Improvement Plans, including strategies developed per Provision B.3, and evaluate whether ~~, rank the MS4 outfalls in the Watershed Management Area according to potential threat to receiving water quality, and produce a prioritized list of major MS4~~ there is a need to update the Water Quality Improvement Plan;

(iii) The Copermittees must review the data collected pursuant to Provision D.2.c and findings from the assessments required pursuant to Provisions D.4.b.(2)(c)(i)-(ii) ~~on an annual basis~~ to:

[a] Identify reductions and progress in achieving reductions in pollutant concentrations and/or pollutant loads from different land uses and/or drainage areas discharging from the Copermittees' MS4s in the Watershed Management Area;

[b] Assess the effectiveness of water quality improvement strategies being implemented by the Copermittees within the Watershed Management Area toward reducing pollutants in ~~storm water~~ discharges from the MS4s to receiving waters within the Watershed Management Area to the MEP, with an estimate, if possible, of the pollutant load reductions attributable to specific water quality strategies implemented by the Copermittees; and

[c] Identify modifications necessary to increase the effectiveness of the water quality improvement strategies implemented by the Copermittees in the Watershed Management Area toward reducing pollutants in ~~storm water~~ discharges from the MS4s to receiving waters in the Watershed Management Area to the MEP.

(iv) Identify data gaps in the monitoring data necessary to assess Provisions D.4.b.(2)(c)(i)-(iii).

Comment [A64]: See discussion in section 3.5.3 of the comment letter.

Comment [A65]: Per edits to that section

Comment [A66]: Per edits above

(d) Within the Regional Monitoring and Assessment report required pursuant to F.3.c.~~The~~ Copermittees must evaluate all the data collected pursuant to Provision D.2.c, and incorporate new outfall monitoring data into time series plots for each long-term monitoring constituent for the Watershed Management Area, and perform statistical trends analysis on the cumulative long-term wet weather MS4 outfall discharge water quality data set.

c. SPECIAL STUDIES ASSESSMENTS

The Copermittees must in the applicable annual report required pursuant to F.3.b.,~~annually~~ evaluate the results and findings from the special studies developed and implemented pursuant to Provision D.3, and assess their relevance to the Copermittees' efforts to characterize receiving water conditions, understand sources of pollutants and/or stressors, and control and reduce the discharges of pollutants from the MS4 outfalls to receiving waters in the Watershed Management Area. The Copermittees must report the results of the special studies assessments applicable to the Watershed Management Area, and identify any necessary modifications or updates to the Water Quality Improvement Plan based on the results in the Annual Reports required pursuant to Provision F.3.b.

d. INTEGRATED ASSESSMENT OF WATER QUALITY IMPROVEMENT PLAN

As part of the iterative approach and adaptive management process required for the Water Quality Improvement Plan pursuant to Provision B.5, the Copermittees in each Watershed Management Area must integrate the data collected pursuant to Provisions D.1-D.3, the findings from the assessments required pursuant to Provisions D.4.a-c, and information collected during the implementation of the jurisdictional runoff management programs required pursuant to Provision E to assess the effectiveness of, and identify necessary modifications to, the Water Quality Improvement Plan as follows:

(1) The Copermittees must re-evaluate the priority water quality conditions and numeric goals for the Watershed Management Area, as needed, during the term of this Order pursuant to Provision B.5.a. The re-evaluation and recommendations for modifications to the priority water quality conditions, and/or numeric goals and corresponding schedules may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Regional Monitoring and Assessment Report ~~of Waste Discharge~~ pursuant to Provision F.3.c~~5.b~~. The priority water quality conditions and numeric goals for the Watershed Management Area must be re-evaluated as follows:

(a) Re-evaluate the receiving water conditions in the Watershed Management Area in accordance with Provision B.2.a;

(b) Re-evaluate the impacts on receiving waters in the Watershed Management Area from MS4 discharges in accordance with Provision B.2.b;

(c) Re-evaluate the identification of MS4 sources of pollutants and/or stressors in accordance with Provision B.2.d;

(d) Identify beneficial uses of the receiving waters that are protected or must be restored in accordance with Provision D.4.a;

(e) Evaluate the progress toward achieving the interim and final numeric goals for restoring impacted beneficial uses in the receiving waters.

(2) The Copermittees must re-evaluate the water quality improvement strategies for the Watershed Management Area during the term of this Order pursuant to Provision B.5.b. The re-evaluation and recommendations for modifications to the water quality improvement strategies and schedules may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Regional Monitoring and Assessment Report pursuant to Provision F.3.c~~must be provided in the Annual Reports required pursuant to Provision F.3.b, and provided in the Report of Waste Discharge pursuant to Provision F.5.b~~. The water quality improvement strategies for the Watershed Management Area must be re-evaluated as follows:

(a) Identify the non-storm water and storm water pollutant loads from the Copermittees' MS4 outfalls in the Watershed Management Area, calculated or estimated pursuant to Provisions D.4.b;

(b) Identify the non-storm water and storm water pollutant load reductions, or other improvements to receiving water or water quality conditions, that are necessary to attain the interim and final numeric goals identified in the WQIP~~for restoring impacted beneficial uses in the receiving waters~~;

(c) Identify any~~the~~ non-storm water and storm water pollutant load reductions, or other improvements to the quality of MS4 discharges, that are necessary for the Copermittees to ~~demonstrate that non-storm water and storm water~~ reduce discharges of pollutants from their MS4s that have been demonstrated to be~~are not~~ causing or contributing to exceedances of receiving water limitations;

(d) Evaluate the progress of the water quality improvement strategies toward achieving the interim and final numeric goals identified in the WQIP~~for restoring impacted beneficial uses in the receiving waters~~.

(3) The Copermittees must re-evaluate and adapt the water quality monitoring and assessment program for the Watershed Management Area when new information becomes available to improve the monitoring and assessment

Comment [A67]: See discussion in section 3.5.3 of the comment letter.

program pursuant to Provision B.5.c. The re-evaluation and recommendations for modifications to the monitoring and assessment program may be provided in the Annual Reports required pursuant to Provision F.3.b, but must at least be provided in the Regional Monitoring and Assessment Report ~~of Waste Discharge~~ pursuant to Provision F.3.c~~5.b~~. Modifications to the water quality monitoring and assessment program must be consistent with the requirements of Provision D.1-D.3. The re-evaluation of the water quality monitoring and assessment program for the Watershed Management Area must consider the data gaps identified by the assessments required pursuant to Provisions D.4.a-b, and results of the special studies implemented pursuant to Provision D.4.c.

5. Monitoring Provisions

Each Copermittee must comply with all the monitoring, reporting, and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

E. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAMS

The purpose of this provision is for each Copermittee to implement a program to control the contribution of pollutants to and the discharges from the MS4 within its jurisdiction. The goal of the jurisdictional runoff management programs is to implement strategies that effectively prohibit non-storm water discharges to the MS4 and reduce the discharge of pollutants in ~~storm water~~ to the MEP. This goal will be accomplished through implementing the jurisdictional runoff management programs in accordance with the strategies identified in the Water Quality Improvement Plans.

Each Copermittee must update its jurisdictional runoff management program document, in accordance with Provision F.2.a, to incorporate all the requirements of Provision E, consistent with their legal authority. Until the Copermittee has updated its jurisdictional runoff management program document with the applicable requirements of Provision E, the Copermittee must continue implementing its current jurisdictional runoff management program.

Modification of Jurisdictional Runoff Management Program Requirements

Modifications shall be considered and where selected, proposed according to the process in Provision B.5. Proposed modifications may increase, decrease, and/or replace minimum requirements identified in Provision E.

1. Legal Authority Establishment and Enforcement

Comment [A68]: See discussion in section 3.6 of the comment letter.

a. Each Copermittee must establish, maintain, and enforce adequate legal authority within its jurisdiction to control pollutant discharges into and from its MS4 through statute, ordinance, permit, or series of contracts, ~~order, or similar means~~ which~~. This legal authority must~~, at a minimum, authorize the Copermittee to:

(1) Effectively prohibit through ordinance, order or other similar means~~Prohibit and eliminate all~~ illicit discharges ~~and illicit connections~~ to its MS4;

(2) Control, through ordinance, permit, contract, order or similar means the contribution of pollutants in discharges to the MS4 by storm water discharges ~~of runoff~~ associated with industrial and construction activity ~~to its MS4~~, and ~~control~~ the quality of storm water discharges ~~runoff~~ from sites of industrial and construction activity~~sites~~, whose discharges have not been separately authorized through ~~that do not, including industrial and construction sites which~~ have coverage under the statewide General Permit for Discharges of Storm Water Associated with Industrial Activities (Industrial General Permit) or General Permit for Discharges of Storm Water Associated with Construction Activities (Construction General Permit)~~, as well as to those sites which do not;~~

Comment [A69]: See discussion in section 3.6.2 of the comment letter.

(3) Control, through ordinance, order or similar means the discharge to the MS4 of spills, dumping, or disposal of materials other than storm water ~~into its~~

Comment [A70]: See discussion in section 3.6.2 of the comment letter.

~~MS4~~;

(4) Control through interagency agreements among Copermittees the contribution of pollutants from one portion of the MS4 to another portion of the MS4;

(5) ~~Control, by coordinating and cooperating with other owners of the MS4 such as Caltrans, the U.S. federal government, or sovereign Native American Tribes through interagency agreements, where possible, the contribution of from their portion of the MS4 to the portion of the MS4 within the Copermittee's jurisdiction;~~

(6) Require compliance with conditions in its ~~statutes,~~ ordinances, permits, contracts, or orders~~, or similar means~~ ~~to hold dischargers to its MS4 accountable for their contributions of pollutants and flows~~;

(7) ~~Require the use of BMPs to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;~~

(8) ~~Require documentation on the effectiveness of BMPs implemented to prevent or reduce the discharge of pollutants in storm water from its MS4 to the MEP;~~

(9) ~~Utilize enforcement mechanisms to require compliance with its statutes, ordinances, permits, contracts, orders, or similar means; and~~

(10) Carry out all inspections, surveillance, and monitoring procedures necessary to determine compliance and noncompliance with permit conditions~~its statutes, ordinances, permits, contracts, orders, or similar means and with the requirements of this Order~~, including the prohibition of illicit discharges and connections to its MS4; ~~the Copermittee must also have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities, including construction sites, discharging into its MS4.~~

b. With the first Annual Report required pursuant to Provision F.3.b, each Copermittee must submit a statement certified by its Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative that the Copermittee has taken the necessary steps to obtain and maintain full legal authority within its jurisdiction to implement and enforce each of the requirements contained in this Order.

2. Illicit Discharge Detection and Elimination

Each Copermittee must implement a program to actively detect and eliminate illicit discharges and improper disposal into the MS4, or otherwise require the discharger

Comment [A71]: See discussion in section 3.6.2 of the comment letter.

Comment [A72]: See discussion in section 3.6.2 of the comment letter.

Comment [A73]: See discussion in section 3.6.2 of the comment letter.

Comment [A74]: See discussion in section 3.6.2 of the comment letter.

Comment [A75]: See discussion in section 3.7 of the comment letter.

to apply for and obtain a separate NPDES permit. The illicit discharge detection and elimination program must be implemented in accordance with the strategies identified in the Water Quality Improvement Plan and include, at a minimum, the following requirements:

STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the illicit discharge detection and elimination program to address ~~non-storm water and~~ illicit discharges and connections that the Copermittee has identified as potential sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate ~~additional~~ BMPs, focus education, and/or increase/decrease frequency of inspections in specific areas); and

(2) The strategies and/or activities ~~must~~ may be modified from ~~consistent with~~ the default requirements of Provisions E.2.~~b-e~~a-d ~~and~~ to be consistent with the strategies identified in the Water Quality Improvement Plan;

(3) The requirements of the programs as outlined in the following sub-provisions may be modified and prioritized as appropriate for consistency with the highest water quality priorities and strategies as identified in the corresponding Water Quality improvement Plan(s).

a. NON-STORM WATER DISCHARGES

To the extent allowable by law, each~~Each~~ Copermittee must address all non-storm water discharges ~~from~~into the MS4 as illicit discharges, where the likelihood exists that they are a source of pollutants to the Receiving Waters, unless ~~a non-storm water~~the discharge is either identified as a discharge authorized by a separate NPDES permit, or identified as a category of non-storm water discharges or flows that is consistent with~~must be addressed pursuant to~~ the following requirements:

(1) ~~Discharges of non-storm water to the MS4 from the following categories must be addressed as illicit dischargeunless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay.~~

Comment [A76]: See discussion in section 3.7.2 of the comment letter.

~~(a) Uncontaminated pumped ground water;~~

~~(b) Discharges from foundation drains;[20]~~

~~(c) Water from crawl space pumps; and~~

~~(d) Water from footing drains.[19]~~

(2) Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under a valid NPDES Permit, ~~No. CAG 679001~~ (Order No. R9-2010-0003, or a subsequent order). This category includes potable water line flushing ~~and water main break~~ discharges from water purveyors issued a water supply permit by the California Department of Public Health or federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit.

Comment [A77]: See discussion in section 3.7.2 of the comment letter.

(3) Discharges of non-storm water into the MS4 from the following categories must be addressed by the Copermittee as illicit discharges only if the Copermittee or the San Diego Water Board identifies the individual discharge as a source of pollutants to receiving waters:

Comment [A78]: See discussion in section 3.7.2 of the comment letter.

(a) Diverted stream flows;

(b) Rising ground waters;

(c) Uncontaminated ground water infiltration to MS4s;

(d) Uncontaminated pumped ground water;

(e) Springs;

(f) Water from crawl space pumps;

~~(c)~~(g) Flows from riparian habitats and wetlands;

(h) Landscape irrigation;

(i) Irrigation water;

(j) Lawn watering;

Comment [A79]: See Legal Comments discussion.

~~[20] Provision E.2.a.(1) only applies to this category on non-storm water if the system is designed to be located at or below the highest historical groundwater table to actively or passively extract groundwater during any part of the year.~~

~~(d)~~(k) Discharges from potable water sources;

~~(e)~~(l) Discharges from foundation drains;[21] and

(m)Discharges from footing drains. .[21]

(4) Discharges of non-storm water into the MS4 from the following categories must be controlled by the requirements given below through statute, ordinance, permit, contract, order, or similar means~~.~~ ~~Discharges of non-storm water to the MS4 from the following categories not controlled by the requirements given below through~~ If such statutes, ordinances, permits, contracts, orders, or similar means have not been enacted by the Copermittee, the applicable categories below must be addressed by the Copermittee as illicit discharges.

(a) Air conditioning condensation

The discharge of air conditioning condensation should~~must~~ be directed to landscaped areas or other pervious surfaces where feasible.

(b) Individual residential vehicle washing

(i) The discharge of wash water ~~must~~ should be directed to landscaped areas or other pervious surfaces where feasible; and

(ii) Minimize the use of water for vehicle washing, use as little washing detergent and other vehicle wash products as possible, wash vehicles at commercial wash facilities, and implement other practices or behaviors that will prevent the discharge of pollutants associated with individual residential vehicle washing from entering the MS4.

(c) Dechlorinated swimming pool discharges

(i) Eliminate residual chlorine, algaecide, filter backwash, or other pollutants from swimming pools prior to discharging to the MS4; and

(ii) The discharge of saline swimming pool water must be directed to the sanitary sewer, landscaped areas, or other pervious surfaces that can accommodate the volume of water, unless the saline swimming pool water can be discharged via a pipe or concrete channel directly to a naturally saline water body (e.g. Pacific Ocean).

(5) Firefighting discharges to the MS4 must be addressed by the Copermittee as

Comment [A80]: See discussion in section 3.7.2 of the comment letter.

Comment [A81]: See discussion in section 3.7.2 of the comment letter.

~~[21] Provision E.2.a.(3) only applies to this category of non-storm water discharge if the system is designed to be located above the highest historical groundwater table at all times of the year, and the system is only expected to discharge non-storm water under unusual circumstances.~~

follows:~~illicit discharges only if the Copermittee or the San Diego Water Board identifies the discharge as a significant source of pollutants to receiving waters. Firefighting discharges to the MS4 not identified as a significant source of pollutants to receiving waters, must be addressed, at a minimum, as follows:~~

(a) Non-emergency firefighting discharges

(i) Building fire suppression system maintenance discharges (e.g~~.~~.,~~.~~ sprinkler line flushing) to the MS4 must be addressed as illicit discharges unless appropriate BMPs are implemented.

(ii) Non-emergency firefighting discharges (i.e., discharges from controlled or practice blazes, firefighting training, and maintenance activities not associated with building fire suppression systems) must be addressed by a program, to be developed and implemented by the Copermittee in conjunction with the local Fire Authority/District, to reduce or eliminate pollutants in such discharges from entering the MS4.

(b) Emergency firefighting discharges (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited.

~~Each Copermittee should develop and encourage implementation of BMPs to reduce or eliminate pollutants in emergency firefighting discharges to the MS4s and receiving waters within its jurisdiction. During emergency situations, priority of efforts should be directed toward life, property, and the environment (in descending order). BMPs should not interfere with immediate emergency response operations or impact public health and safety.~~

(6) If the Copermittee or San Diego Water Board identifies any category of non-storm water discharges listed under Provisions E.2.a.(1)-(4) as a source of pollutants to receiving waters, the category must be effectively prohibited through ordinance, order, or similar means and addressed as an illicit discharge.

(7) ~~Each Copermittee must, where feasible, reduce or eliminate non-storm water discharges listed under Provisions E.2.a.(1)-(4) into its MS4 whether or not the non-storm water discharge has been identified as an illicit discharge, unless a non-storm water discharge is identified as a discharge authorized by a separate NPDES permit.~~

Comment [A82]: See discussion in section 3.7.2 of the comment letter.

b. PREVENT AND DETECT ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must include the following measures within its program to prevent and detect illicit discharges to the MS4:

(1) Each Copermittee must maintain an updated map of its entire MS4 and the corresponding drainage areas. The accuracy of the MS4 map must be confirmed during the field screening required pursuant to Provision E.2.c. The MS4 map must be included as part of the jurisdictional runoff management program document. Any geographic information system (GIS) layers or files used by the Copermittee to maintain the MS4 map must be made available to the San Diego Water Board upon request. The MS4 map must identify the following:

(a) All segments of the MS4 owned, operated, and maintained by the Copermittee;

(b) All known locations of inlets that discharge and/or collect runoff into the Copermittee's MS4;

(c) All known locations of connections with other MS4s not owned or operated by the Copermittee (e.g. Caltrans MS4s);

(d) All known locations of major MS4 outfalls as defined by 40 CFR §122.26(b)(5-6) ~~and private outfalls,~~ that discharge runoff collected from areas within the Copermittee's jurisdiction;

(e) All segments of receiving waters within the Copermittee's jurisdiction that receive and convey runoff discharged from the Copermittee's MS4 outfalls;

(f) Locations of the MS4 outfalls, identified pursuant to Provision D.2.a.(1), within its jurisdiction; and

(g) Locations of the non-storm water persistent flow MS4 outfall discharge monitoring stations, identified pursuant to Provision D.2.b.(2)(b), within its jurisdiction.

(2) Each Copermittee must use Copermittee personnel and contractors to assist in identifying and reporting illicit discharges and connections during their daily employment activities.

(3) Each Copermittee must promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges to or from the MS4, including the following methods for public reporting:

(a) Operate a public hotline, which can be Copermittee-specific or shared by the Copermittees, and must be capable of receiving reports in both English and Spanish 24 hours per day and seven days per week; and

Comment [A83]: See discussion in section 3.7.2 of the comment letter.

(b) Designate an e-mail address for receiving electronic reports from the public, which can be Copermittee-specific or shared by the Copermittees, and must be prominently displayed on the Copermittee's webpage and the Regional Clearinghouse required pursuant to Provision F.4.

(4) Each Copermittee must implement practices and procedures (including a notification mechanism) to prevent, respond to, contain, and clean up any spills that may discharge into the MS4 within its jurisdiction from any source. Such practices and procedures may include the coordination with other parties, such as sanitary sewer operators. The Copermittee must coordinate, to the extent possible, with spill response teams to prevent entry of spills into the MS4~~, and prevent contamination of surface water, ground water, and soil.~~ The Copermittee must coordinate spill prevention, containment, and response activities throughout all appropriate internal~~Copermittee~~ departments, programs, and agencies.

Comment [A84]: See discussion in section 3.7.2 of the comment letter.

(5) Each Copermittee must implement practices and procedures to ~~prevent~~ control and limit infiltration of seepage from sanitary sewers owned by a Copermittee agency (including private laterals and failing septic systems) to the MS4.

(6) Each Copermittee shall~~must~~ coordinate, when necessary, with upstream Copermittees and/or entities to prevent illicit discharges from upstream sources into the MS4 within its jurisdiction.

c. Field Screening

Each Copermittee must conduct field screening (i.e. visual observations, field testing, and/or analytical testing) of MS4 outfalls and other portions of its MS4 within its jurisdiction to detect non-storm water and illicit discharges and connections to the MS4 in accordance with the dry weather MS4 outfall discharge monitoring requirements in Provisions D.2.a.(2) and D.2.b.(1).

d. Investigate and Eliminate Illicit Discharges And Connections

Each Copermittee must include the following measures within its program to investigate and eliminate illicit discharges to the MS4 to comply with provision A.1.b:

(1) Each Copermittee must prioritize and determine when follow-up investigations will be performed in response to visual observations and/or water quality monitoring data collected during an investigation of a detected non-storm water ~~or~~ illicit discharge into or from the MS4. The criteria for prioritizing investigations must consider the following:

(a) Pollutants identified as causing or contributing to the highest water quality priorities identified in the Water Quality Improvement Plan;

(b) Pollutants identified as causing or contributing, or threatening to cause or contribute to impairments in water bodies on the 303(d) List and/or in environmentally sensitive areas (ESAs), located within its jurisdiction;

(c) Pollutants identified from sources or land uses known to exist within the area, drainage basin, or watershed that discharges to the portion of the MS4 within its jurisdiction included in the investigation;

(d) Pollutants identified as causing or contributing to an exceedance of a NAL in the Water Quality Improvement Plan, where the source has not been identified as natural or otherwise permitted; and

(e) Pollutants identified as an immediate and significant threat to human health or the environment.

(2) Each Copermittee must implement procedures to investigate and inspect portions of its MS4 that, based on reports or notifications, field screening, or other appropriate information, indicate a reasonable potential of receiving, containing, or discharging pollutants due to illicit discharges, or illicit connections~~, or other sources of non-storm water~~. The procedures must include the following:

(a) Each Copermittee must develop criteria to:

(i) Assess the validity of each report or notification received; and

(ii) Prioritize the response to each report or notification received.

(b) Each Copermittee must prioritize and respond to each valid report or notification (e.g., public reports, staff or contractor reports and notifications, etc.) of an incident in a timely manner.

(c) ~~Each~~In accordance with the procedures defined in Provision E.2.d.(1), each~~Each~~ Copermittee must investigate and seek to identify the source(s) of discharges of non-storm water illicit discharges or illicit connections ~~where flows are~~ observed into and from the MS4 during the field screening required pursuant to Provision D.2.b.(1) as follows:

(i) Obvious illicit discharges (i.e., unusual color or odor) must be immediately investigated to identify the source(s) of non-storm water illegal discharges;

(ii) The investigation must include field investigations to identify sources or potential sources for the discharge, unless the source or potential source has already been identified during previous investigations; and

(iii) The investigation may include follow-up field investigations and/or reviewing Copermittee inventories and other land use data to identify potential sources of the discharge.

(d) Each Copermittee must maintain records and a database of the following information:

(i) Location of incident, including hydrologic subarea, portion of MS4 receiving the non-storm water ~~or~~ illicit discharge, and point of discharge or potential discharge from MS4 to receiving water;

(ii) Source of information initiating the investigation (e.g., public reports, staff or contractor reports and notifications, field screening, etc.);

(iii) Date the information used to initiate the investigation was received;

(iv) Date the investigation was initiated;

(v) Dates of follow-up investigations;

(vi) Identified or suspected source of the illicit discharge or connection, if determined;

(vii) Known or suspected related incidents, if any;

(viii) Result of the investigation; and

(ix) If a source cannot be identified and the investigation is not continued, a rationale for why a discharge does not pose a threat to water quality and/or does not require additional investigation.

(e) Each Copermittee must ~~track~~ document, and where feasible quantify, any readily~~and seek to~~ identifiabley the source(s) of non-storm water illegal discharges from the MS4 where there is evidence of non-storm water ~~having been discharged~~illegal discharges or connections into or from the MS4 (e.g., pooled water), in accordance with MS4 outfall discharge monitoring requirements in Provisions D.2.a.(2) and D.2.b.

(3) Each Copermittee must initiate the implementation of procedures, in a timely manner, to eliminate all detected and identified illicit discharges and connections within its jurisdiction. The procedures must include the following responses:

(a) Each Copermittee must enforce its legal authority, as required under Provision E.1, to eliminate illicit discharges and connections to the MS4.

(b) If the Copermittee identifies the source as a controllable source of non-storm water ~~or~~ illicit discharge or connection, the Copermittee must implement its Enforcement Response Plan pursuant to Provision E.6 and enforce its legal authority to effectively prohibit and with the goal of eliminatinge illicit discharges and connections to its MS4.

Comment [A85]: See discussion in section 3.7.2 of the comment letter.

(c) If the Copermittee identifies the source of the discharge as a category of non-storm water discharges in Provision E.2.a, and the discharge is in exceedance of NALs in the Water Quality Improvement Plan, then the Copermittee must determine if: (1) this is an isolated incident or set of circumstances that will be addressed through its Enforcement Response Plan pursuant to Provision E.6, or (2) the category of discharge must be addressed through the effective prohibition of that category of discharge as an illicit discharge pursuant to Provision E.2.a.(6).

(d) If the Copermittee suspects the source of the non-storm water discharge as natural in origin (i.e. non-anthropogenically influenced) and in conveyance into the MS4, then the Copermittee must document and provide the data and evidence necessary to demonstrate to the San Diego Water Board that it is natural in origin and does not require further investigation.

(e) If the Copermittee identifies that the discharge is coming from another Copermittees' jurisdiction, the receiving Copermittee must document and provide the findings to the upstream Copermittee. The obligation to implement the requirements of provision E.2.d.(3) are thenceforth the responsibility of the upstream Copermittee.

(f) If the Copermittee identifies the source as a non-storm water discharge that has been separately authorized by the San Diego Water Board, or that is contributing pollutants to the MS4 and that may require coverage under a WDR from the San Diego Water Board, the Copermittee shall provide all relevant findings to the San Diego Water Board and may back charge the Regional Board for the entire cost of conducting the source investigation.

~~(e)~~(g) If the Copermittee is unable to identify and document the source of a recurring non-storm water discharge to or from the MS4, then the Copermittee must ~~address the discharge as an illicit discharge and~~ update its jurisdictional runoff management program to address the common and suspected sources of the non-storm water discharge within its jurisdiction in accordance with the Copermittee's priorities.

(4) Each Copermittee must submit a summary of the non-storm water discharges and illicit discharges and connections investigated and eliminated within its jurisdiction with each Annual Report required under Provision F.3.b of this Order.

3. Development Planning

Each Copermittee must, within their jurisdiction, use their land use and planning

Comment [A86]: See discussion in section 3.7.2 of the comment letter.

Comment [A87]: See discussion in section 3.8 of the comment letter.

authorities, to the extent that they may lawfully impose requirements, to implement a development planning program in accordance with the strategies identified in the Water Quality Improvement Plan and includes, at a minimum, the following requirements:

STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Comment [A88]: See discussion in section 3.8.2 of the comment letter.

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the development planning program to address development and redevelopment projects that may become sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional or alternative BMPs, focus education, increase frequency of verifications and/or inspections, alternative compliance options);

(2) Each Copermittee must identify areas within its jurisdiction where Priority Development Projects may be allowed or should be encouraged to implement or contribute toward the implementation of alternative compliance retrofitting and/or stream, channel, or habitat rehabilitation projects;

(3) Each Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify regional alternative compliance projects that Priority Development Projects may be allowed or should be encouraged to implement or participate in implementing; and

(4) The requirements of the programs as outlined in the following sub-provisions may be modified and prioritized as appropriate for consistency with the highest water quality priorities and strategies as identified in the corresponding Water Quality improvement Plan(s).~~The strategies and/or activities must be consistent with the requirements of Provisions E.3.a-c and E.3.e-f and the strategies identified in the Water Quality Improvement Plan.~~

a. BMP REQUIREMENTS FOR ALL DEVELOPMENT PROJECTS

Each Copermittee, as practical and feasible, must prescribe the following BMP requirements during the planning process (i.e. prior to project approval and issuance of local permits) for all development projects (regardless of project type or size), where local permits are issued, including unpaved roads and flood management projects, except emergency / public safety projects implemented for the protection of persons and property:

(1) General Requirements

(a) Onsite BMPs must be located so as to remove pollutants from runoff prior to its discharge to any receiving waters, and as close to the source as possible; and

(b) Structural BMPs must not be constructed within a waters of the U.S.. ~~, or waters of the state.~~

(2) Source Control BMP Requirements

The following source control BMPs must be implemented at all development projects where applicable and feasible:

(a) Prevention of illicit discharges into the MS4;

(b) Storm drain system stenciling or signage;

(c) Properly designed outdoor material storage areas;

(d) Properly designed outdoor work areas;

(e) Properly designed trash storage areas; and

(f) Any additional BMPs determined necessary by the Copermittee to minimize pollutant generation at each project.

(3) Low Impact Development (LID) ~~BMP Requirements~~Principles

Comment [A89]: See discussion in section 3.8.2 of the comment letter.

The following LID ~~BMPs~~ Principles must be implemented at all development projects where applicable and feasible:

(a) Maintenance or restoration of natural storage reservoirs and drainage corridors (including topographic depressions, areas of permeable soils, natural swales, and ephemeral and intermittent streams);[22]

(b) Buffer zones for natural water bodies (where buffer zones are technically infeasible, require project applicant to include other buffers such as trees, access restrictions, etc.);

(c) Conservation of natural areas within the project footprint including existing trees, other vegetation, and soils;

[22] Development projects proposing to dredge or fill materials in waters of the U.S. must obtain a CWA Section 401 Water Quality Certification. Projects proposing to dredge or fill waters of the state must obtain waste discharge requirements.

(d) Construction of streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided public safety is not compromised;

(e) Minimization of the impervious footprint of the project;

(f) Minimization of soil compaction to landscaped areas;

(g) Disconnection of impervious surfaces through distributed pervious areas;

(h) Landscaped or other pervious areas designed and constructed to effectively receive and infiltrate, retain and/or treat runoff from impervious areas, prior to discharging to the MS4;

(i) Small collection strategies located at, or as close as possible to, the source (i.e. the point where storm water initially meets the ground) to minimize the transport of runoff and pollutants to the MS4 and receiving waters;

(j) Use of permeable materials for projects with low traffic areas and appropriate soil conditions;

(k) Landscaping with native or drought tolerant species; and

(l) Harvesting and using precipitation.

b. PRIORITY DEVELOPMENT PROJECTS

(1) Definition of Priority Development Project

Priority Development Projects include the following:

(a) All new development projects that fall under the Priority Development Project categories listed under Provision E.3.b.(2) (where a new development project feature, such as a parking lot, falls into a Priority Development Project category, the entire project footprint is subject to Priority Development Project requirements); and

(b) Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site, and the redevelopment project is a Priority Development Project category listed under Provision E.3.b.(2) (where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to Priority Development Project requirements, the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) apply only to the addition or replacement, and not to the entire development; where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development, the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) apply to the entire development).

(c) Projects where redevelopment results in an increase of more than fifty percent of impervious surfaces of a previously existing development, and the existing development *was* subject to previous Priority Project Development Requirements, only the altered portion of development is subject to the new Priority Development Project requirements.

Comment [A90]: See discussion in section 3.8.2 of the comment letter.

(2) Priority Development Project Categories

Comment [A91]: See discussion in section 3.8.2 of the comment letter.

(a) New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This category includes commercial, industrial, residential, mixed-use, and public development projects on public or private land which fall under the planning and building authority of the Copermittee.

(b) New development projects that create 5,000 square feet or more of impervious surfaces (collectively over the entire project site), and are designed for support one or more of the following uses (see Appendix for definitions):

(i) Automotive repair shop
(ii) Restaurant
(iii) Parking lot[23]
(iv) Street, road, highway, freeway
(v) Retail gasoline outlet (RGO)

Comment [A92]: See footnote

~~(b) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.~~

~~(c) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is 5,000 square feet or more.~~

~~(d) Hillside development projects. This category includes any development which creates 5,000 square feet or more of impervious surface which is~~

[23] Excluding parking lots that are not subject to runoff, such as but not limited to covered or subterranean parking lots

~~located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.~~

~~(e)~~(c) New development projects that create 2,500 square feet or more of impervious surfaces (collectively over the entire project site), and are ~~Environmentally sensitive areas (ESAs). This category includes any development~~ located within, directly adjacent to, or discharging directly to an ESA, ~~which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition.~~ "Directly adjacent to" means situated within 200 feet of the ESA. "Discharging directly to" means outflow from a drainage conveyance system that collects runoff from the subject development or redevelopment site and terminates at or in receiving waters within the ESA and is not commingled with flows from adjacent or other upstream lands.

~~(f) Parking lots. This category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce that has 5,000 square feet or more of impervious surface.~~

~~(g) Streets, roads, highways, freeways, and driveways. This category is defined as any paved impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles.~~

~~(h) Retail gasoline outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.~~

~~(i)~~(d) Large development projects. This category includes any post-construction pollutant-generating new development projects that result in the permanent disturbance of one acre or more of land.

(3) Priority Development Project Exemptions

Comment [A93]: See discussion in section 3.8.2 of the comment letter.

Each Copermittee has the discretion to exempt the following projects from being defined as Priority Development Projects:

(a) New paved sidewalks, driveways, parking lots, bicycle lanes, or trails that meet the following criteria:

(i) Designed and constructed to direct storm water runoff to adjacent vegetated areas, or other non-erodible permeable areas; OR

(ii) Designed and constructed to be hydraulically disconnected from paved streets or roads; OR

(iii) Designed and constructed with permeable pavements or surfaces in accordance with USEPA Green Streets guidance.[24]

(b) Any impervious surface that is 5,000 square feet or more used for the transportation of automobiles, trucks, motorcycles, and other vehicles that is designed and constructed to the Maximum Extent Practicable in accordance with the USEPA Green Streets Guidance “Managing Wet Weather with Green Infrastructure: Green Streets”[25]. ~~Retrofitting of existing paved alleys, streets or roads that meet the following criteria:~~

~~(i) Must be two lanes or less; AND~~

~~(ii) Must be a retrofitting project implemented as part of an alternative compliance project option under Provision E.3.c.(3)(b)(v) to achieve the performance requirements of Provisions E.3.c.(1) and/or E.3.c.(2) for a Priority Development Project; AND~~

~~(iii) Designed and constructed in accordance with the USEPA Green Streets guidance.~~[26]

(c) Single-family residential projects that meet the following criteria:

(i) Must not be constructed as part of a larger development or proposed subdivision;

(ii) Successfully incorporate and document that they have incorporated, each of the applicable Source Control and LID BMP strategies identified in provisions E.3.a.(2)-(3) to the MEP.

~~(c) New single family residences that meet the following criteria:~~

~~(i) Must not be constructed as part of a larger development or proposed subdivision; AND~~

~~(ii) Designed and constructed to be certified under the U.S. Green Building Council (USGCB) Leadership in Energy and Environmental Design (LEED) for Homes green building certification program, receiving at least four (4) Surface Water Management credits under the Sustainable Sites category~~[27] ~~OR~~

~~Designed and constructed with structural BMPs that will achieve the~~

[24] USEPA. 2008. http://water.epa.gov/infrastructure/greeninfrastructure/upload/gi_munichandbook_green_streets.pdf and http://water.epa.gov/infrastructure/greeninfrastructure/gi_policy.cfm#municipalhandbook ~~See “Managing Wet Weather with Green Infrastructure – Municipal Handbook: Green Streets” (USEPA, 2008).~~

[26] ~~Ibid.~~
[27] ~~See LEED for Homes rating system at http://www.usgbc.org~~

~~performance requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite~~

~~(d) Redevelopment of existing single family residences that meet the following criteria:~~

~~(i) Designed and constructed to be certified under the USGCB LEED for Homes green building certification program, receiving at least four (4) Surface Water Management credits under the Sustainable Sites category;[28] OR~~

~~(ii) Designed and constructed with structural BMPs that will achieve the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite.~~

(d) Watershed Protection Projects that meet the following criteria:

(i) Projects undertaken to rehabilitate or prevent environmental, social, and economic damage to the watershed, including receiving waters, by providing one or more of the following:

- Water quality protection by the proper management of stormwater and floodplains
- Flood risk reduction to adjacent land uses, stored matter and stockpiled material
- Elimination of the comingling of stormwater and hazardous materials
- Erosion Mitigation
- Restoration of Rivers and Ecosystems
- Groundwater Recharge
- Creation of new open space and wetlands
- Programs for water conservation, stormwater capture and management
- Retrofit projects constructed to improve water quality or address hydromodification.

(ii) AND are not expected to be pollutant generating or are designed to reduce existing pollutant loads

(iii) AND incorporate and document that they have incorporated, each of the applicable Source Control and LID BMP strategies identified in provisions E.3.a.(2)-(3) to the MEP.

(e) Emergency public safety projects in any of the Priority Development Categories may be excluded if the delay caused due to the requirement for a SSMP compromises public safety, public health and/or environmental protection

~~[28] See LEED for Homes rating system at http://www.usgbc.org~~

c. PRIORITY DEVELOPMENT PROJECT STRUCTURAL BMP PERFORMANCE REQUIREMENTS

In addition to the BMP requirements listed for all development projects under Provision E.3.a, Priority Development Projects must also implement structural BMPs that conform to performance requirements below. If watershed-specific performance requirements are ~~may be~~ developed as part of a Water Quality Improvement Plan; these requirements would take precedence over the general performance requirements below. The watershed-specific requirement must provide at least equal protection as the general performance requirements below.

(1) Storm Water Pollutant Control BMP Requirements

Comment [A94]: See discussion in section 3.8.2 of the comment letter.

Each Copermittee must require each Priority Development Project to implement onsite structural BMPs to control pollutants in storm water that may be discharged from a project as follows:

(a) Each Priority Development Project must be required to implement LID BMPs that are designed to retain (i.e. intercept, store, infiltrate, evaporate, and evapotranspire) onsite the pollutants contained in the design capture volume. The design capture volume is equivalent to:

(i) The volume of storm water runoff produced from a 24-hour 85th percentile storm event;[29] OR

(ii) The volume of storm water runoff produced from a 24-hour 85th percentile storm event, that would be retained onsite ~~if~~ in the pre-project condition. ~~site was fully undeveloped and naturally vegetated~~, ~~as determined using continuous simulation modeling techniques based on site-specific soil conditions and typical native vegetative cover.~~

(b) A Priority Development Project may be allowed to utilize alternative compliance under Provision E.3.c.(3) in lieu of~~to~~ complying with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1)(a).

~~(c) If a Priority Development project is allowed to utilize alternative compliance pursuant to Provisions E.3.c.(1)(b), flow-thru conventional~~

[29] This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals. The volume is a single event-based volume that occurs after an extended dry period.

~~treatment control BMPs must be implemented to treat the portion of the design capture volume that is not retained onsite. Additionally, project applicants must mitigate for the portion of the pollutant load in the design capture volume that is not retained onsite through one or more alternative compliance options under Provision E.3.c.(3). Conventional treatment control BMPs must be sized and designed to:~~

~~(i) Remove pollutants from storm water to the MEP;~~

~~(ii) Filter or treat either: 1) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event, or 2) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two;~~

~~(iii) Be ranked with high or medium pollutant removal efficiency for the Priority Development Project's most significant pollutants of concern. Conventional treatment control BMPs with a low removal efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted which exhibits that implementation of conventional treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.~~

(2) Hydromodification Management BMP Requirements

Comment [A95]: See discussion in section 3.8.2 of the comment letter.

Each Copermittee must require each Priority Development Project disturbing greater than one acre to implement management measures~~onsite structural BMPs~~ to ensure ~~manage hydromodification~~ that ~~may be caused by~~ storm water runoff discharged from the~~a~~ project won't cause adverse Hydromodification impacts in the downstream receiving waters as follows:

The Copermittees in each Watershed Management Area may establish within the WQIP, watershed specific mitigation requirements that will apply to priority development projects, based on the susceptibility of the receiving waters to Hydromodification impacts caused by the project, and consistent with the priorities and strategies identified in the WQIP. Such requirements may be uniform across a Hydrologic Unit, or identified at an appropriate smaller scale to ensure that receiving waters are properly protected.

(a) Post-project runoff flow rates and durations must not exceed pre-project ~~development (naturally occurring)~~ runoff flow rates and durations by more than 10 percent (for the range of flows that result in increased potential for erosion, or degraded instream habitat conditions downstream of Priority Development Projects~~)~~.

(i) In evaluating the range of flows that results in increased potential for erosion of natural (non-hardened) channels, the lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks.

~~(ii) For artificially hardened channels, analysis to identify the lower boundary must use characteristics of a natural stream segment similar to that found in the watershed. The lower boundary must correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or erodes the toe of the channel banks.~~

~~(iii)~~(ii) The Copermittees may use monitoring results collected pursuant to Provision D.1.a.(2) to re-define the range of flows resulting in increased potential for erosion, or degraded instream habitat conditions, as warranted by the data.

(b) Priority Development Projects ~~Post-project runoff flow rates and durations~~ must implement appropriate measures to minimize the ~~compensate for~~ the loss of sediment supply delivered ~~due~~ to the Receiving Waters, consistent with WQIP priorities, ~~development project,~~ should loss of sediment supply be anticipated to occur as a result of the development project.

(c) A Priority Development Project may be allowed to utilize alternative compliance under Provision E.3.c.(3) in lieu of~~to comply with~~ the performance requirements of Provisions E.3.c.(2)(a)-(b).

(d) Exemptions

Each Copermittee has the discretion to exempt a Priority Development Project from the hydromodification management BMP performance requirements of Provisions E.3.c.(2)(a)-(b) where the project:

(i) Discharges storm water runoff into existing underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean;

(ii) Discharges of storm water into conveyance channels whose bed and bank are engineered and maintained for the 10-year ultimate development flow rate all the way from the point of discharge from the project to an water body that is sufficiently resistant to hydromodification (water storage reservoirs, lakes, enclosed embayments, pacific ocean, or other water bodies identified in the WQIP);

~~(ii)~~(iii) Is a redevelopment Priority Development Project that meets the alternative compliance requirements of Provision E.3.c.(3)(b)(ii); or

~~(iii)~~(iv) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt from the requirements of Provisions E.3.c.(2)(a)-(b), through an approved WQIP.

(3) Alternative Compliance to Onsite Structural BMP Performance Requirements

Comment [A96]: See discussion in section 3.8.2 of the comment letter.

(a) Applicability

At the discretion of each Copermittee, Priority Development Projects may be allowed to implement one or more of the alternative compliance project options described in E.3.c.(3)(b) below, in lieu of complying with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2), under the following conditions:

(i) The Copermittee must determine that implementation of the alternative compliance option will have an equal or greater overall water quality benefit for the Watershed Management Area than fully complying with the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite;

(ii) The alternative compliance options must be designed by a registered professional engineer, geologist, architect, biologist, hydrologist, landscape architect, or other appropriate certified professional;

(iii) The alternative compliance option must be consistent with the strategies developed within the WQIP, for the highest priority water quality conditions.

(iv) The alternative compliance options must be implemented within the same Watershed Management Area as the Priority Development Project, and preferably within the same hydrologic subarea;

(v) The alternative compliance options must have reliable sources of funding for operation and maintenance.

(b) Alternative Compliance Options

(i) *LID Biofiltration Treatment Control BMPs*

LID biofiltration treatment control BMPs may be used as an alternative compliance option if the BMPs are sized and designed to:

[a] Remove pollutants from storm water to the MEP; AND
[b] Have an appropriate surface loading rate to prevent erosion, scour and channeling; AND
[c] Biofilter at least 1.0 times the design capture volume that is not reliably retained onsite

(ii) *LEED Certified Redevelopment Projects*

Priority Development Projects that are designed and constructed to be certified under the USGCB LEED for New Construction and Major Renovations green building certification program, or other locally accepted certification of equivalent effectiveness, may be considered as an acceptable alternative compliance option if the project meets the following criteria:

[a] The project is designed to receive at least: One (1) Site Design credit, and Two (2) Stormwater Design credits under the Sustainable Sites category.[30] , and

[b] The existing and future configuration of the receiving water must not be unnaturally altered or adversely impacted by the project.

(iii) *Watershed-Based Planned Development Projects*

Priority Development Projects greater than 100 acres in total project size (or smaller than 100 acres in size yet part of a larger common plan of development that is over 100 acres) may be considered as an acceptable alternative compliance option if the project meets the following conditions:

[a] The Priority Development Project was planned utilizing watershed and/or subwatershed based water quality, hydrologic, and fluvial geomorphologic planning principles that implement regional LID BMPs in accordance with the performance and location criteria of this Order and acceptable to the San Diego Water Board;

[b] Regional LID BMPs may be used provided that the BMPs capture and retain the volume of runoff produced from the design capture volume defined in Provision E.3.c.(1)(a)(i) and that such controls are located upstream of receiving waters;

[c] Regional LID BMPs must clearly exhibit that they will not result in a net impact from pollutant loadings over and above the impact caused by capture and retention of the design capture volume;

[d] Any portion of the design capture volume that is not retained by the regional LID BMPs must be treated using biofiltration BMPs; and

[e] Where regional LID BMPs are demonstrated to the Copermittee as technically infeasible to retain the entire design capture volume, any volume up to and including the design capture volume not retained by regional LID BMPs, nor treated by biofiltration BMPs, must be treated using conventional treatment control BMPs and the project applicant must implement additional alternative compliance project, in-lieu fee and/or water quality

[30] See LEED for New Construction and Major Renovations rating system at http://www.usgbc.org

credit system options below.

(iv) *Offsite Projects*

Offsite Projects, such as but not limited to Regional BMPs; Retrofitting Projects; Channel, Stream or Habitat Rehabilitation Projects; Water Supply Augmentation Projects; or other Offsite Projects proposed by a project proponent, may be considered as an acceptable alternative compliance option if the offsite project meets the following requirements:

- The project must provide a net result of at least the same level of pollutant removal, and/or protection from potential downstream and upstream erosion in the receiving water as would be required to meet the performance requirements of Provision E.3.c.(1) and E.3.c.(2), as applicable.
- The project must be consistent with the strategies identified in the WQIP.
- The project must be constructed and operational prior to occupancy being granted for the PDP.

(v) *Conventional Treatment Control BMPs*

Onsite Conventional Treatment Control BMPs may be used as an alternative compliance option, only if the following criteria have been met:

[a] It has been demonstrated to the satisfaction of the Copermittee that it is technically infeasible to comply with the onsite requirements of E.3.c.(1), AND

[b] It has been demonstrated to the satisfaction of the Copermittee that it is technically infeasible to implement onsite Biofiltration Treatment Control BMPs, AND

[c] The Conventional Treatment Control BMPs will remove pollutants from storm water to the MEP; AND

[d] The Conventional Treatment Control BMPs will filter or treat either: 1) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event, or 2) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two; AND

[e] The Conventional Treatment Control BMPs are ranked with high or medium pollutant removal efficiency for the Priority Development Project's most significant pollutants of concern. Conventional treatment control BMPs with a low removal

efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted which exhibits that implementation of conventional treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.

~~(a) Applicability~~

~~At the discretion of each Copermittee, Priority Development Projects may be allowed to utilize an alternative option to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) under the following conditions:~~

~~(i) The Copermittee must determine that implementation of the alternative compliance option will have a greater overall water quality benefit for the Watershed Management Area than fully complying with the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite;~~

~~(ii) The alternative compliance options must be designed by a registered professional engineer, geologist, architector landscape architect;~~

~~(iii) The alternative compliance options must be implemented within the same hydrologichydrologic unit as the Priority Development Project, and preferably within the same hydrologic subarea;~~

~~(iv) Receiving waters must not be utilized to convey storm water runoff to the alternative compliance options;~~

~~(v) The pollutants in storm water runoff from the Priority Development Project must be treated to the MEP by the alternative compliance options prior to being discharged to receiving waters;~~

~~(vi) Unless otherwise allowed by Provision E.3.c.(3)(b), the alternative compliance options must have a net result of at least the same level of pollutant removal as would have been achieved if the Priority Development Project had fully complied with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1) onsite;~~

~~(vii) Unless otherwise allowed by Provision E.3.c.(3)(b), the alternative compliance options must have a net result of at least the same level of protection from potential downstream and upstream erosion in the receiving water as would have been achieved if the Priority Development Project had fully complied with the hydromodification management BMP performance requirements of Provision E.3.c.(2) onsite; and~~

~~(viii) The alternative compliance options utilized by the Priority Development Project must have reliable sources of funding for operation and maintenance.~~

~~(b) Alternative Compliance Project Options~~

~~The Copermittee may allow implementation of one or more of the following project options as part of an alternative approach to complying with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2):~~

~~(i) *Onsite LID Biofiltration Treatment Control BMPs*~~

~~The Copermittee may allow Priority Development Projects to utilize onsite LID biofiltration treatment control BMPs to comply with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1). Onsite LID biofiltration treatment control BMPs must be sized and designed to:~~

~~[a] Remove pollutants from storm water to the MEP; AND~~
~~[b] Have an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP; AND~~
~~[c] Biofilter at least 1.5 times the design capture volume that is not reliably retained onsite; OR~~
~~[d] Biofilter up to the design capture volume that is not reliably retained onsite, AND 1) treat the remaining portion of the design capture volume not retained onsite with conventional treatment control BMPs in accordance with Provision E.3.c.(1)(c), and 2) if necessary, mitigate for the portion of the pollutant load in the design capture volume not retained onsite through one or more alternative compliance project, in-lieu fee and/or water quality credit system options below.~~

~~(ii) *LEED Certified Redevelopment Projects*~~

~~The Copermittee may allow redevelopment Priority Development Projects to comply with designed and constructed to be certified under the USGCB LEED for New Construction and Major Renovations green building certification program. The Priority Development Project must receive at least one (1) Site Design credit and two (2) Stormwater Design credits under the Sustainable Sites category.[31] In addition, the existing and future configuration of the receiving water must not be unnaturally altered or adversely impacted by storm water flow rates and durations discharged from the site.~~

~~(iii) *Watershed-Based Planned Development Projects*~~

~~The Copermittee may allow Priority Development Projects greater than 100 acres in total project size (or smaller than 100 acres in size~~

~~[31] See LEED for New Construction and Major Renovations rating system at http://www.usgbc.org~~

~~yet part of a larger common plan of development that is over 100 acres) to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2). The Priority Development Project must comply with the following conditions:~~

~~[a] The Priority Development Project was planned utilizing watershed and/or subwatershed based water quality, hydrologic, and fluvial geomorphologic planning principles that implement regional LID BMPs in accordance with the performance and location criteria of this Order and acceptable to the San Diego Water Board;~~
~~[b] Regional LID BMPs may be used provided that the BMPs capture and retain the volume of runoff produced from the design capture volume defined in Provision E.3.c.(1)(a)(i) and that such controls are located upstream of receiving waters;~~
~~[c] Regional LID BMPs must clearly exhibit that they will not result in a net impact from pollutant loadings over and above the impact caused by capture and retention of the design capture volume;~~
~~[d] Any portion of the design capture volume that is not retained by the regional LID BMPs must be treated using biofiltration BMPs; and~~
~~[e] Where regional LID BMPs are demonstrated to the Copermittee as technically infeasible to retain the entire design capture volume, any volume up to and including the design capture volume not retained by regional LID BMPs, nor treated by biofiltration BMPs, must be treated using conventional treatment control BMPs and the project applicant must implement additional alternative compliance project, in-lieu fee and/or water quality credit system options below.~~

~~(iv) *Offsite Regional BMPs*~~

~~[a] The Copermittee may allow Priority Development Projects to utilize offsite regional BMPs to comply with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1) if the offsite regional BMPs have the capacity to receive and retain at least 1.1 times the design capture volume that is not reliably retained onsite.~~
~~[b] The Copermittee may allow Priority Development Projects to utilize offsite regional BMPs to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) if the offsite regional BMPs have the capacity to manage the storm water flows rates and durations from the site such that the receiving waters are protected from the potential for increased erosion that would be caused if the unmanaged portion of the runoff was discharged from the site.~~

~~(v) *Offsite Retrofitting Projects*~~

~~The Copermittee may allow Priority Development Projects to utilize offsite retrofitting projects to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the retrofitting projects have been identified within the strategies included in the Water Quality Improvement Plan, or identified as potential retrofitting projects by the Copermittee pursuant to Provision E.5.~~

~~(vi) *Offsite Channel, Stream, or Habitat Rehabilitation Projects*~~

~~The Copermittee may allow Priority Development Projects to utilize offsite channel, stream, or habitat rehabilitation projects to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) if the rehabilitation projects have been identified within the strategies included in the Water Quality Improvement Plan, or identified as potential channel rehabilitation projects by the Copermittee pursuant to Provision E.5. The channel, stream, or habitat rehabilitation project cannot be utilized for pollutant treatmentexcept where artificial wetlands areand located upstream of receiving waters.~~

~~(vii) *Offsite Regional Water Supply Augmentation Projects*~~

~~The Copermittee may allow Priority Development Projects to utilize offsite regional water supply augmentation projects (i.e. groundwater recharge, recycled water, storm water harvesting) to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the projects have been identified within the strategies included in the Water Quality Improvement Plan.~~

~~(viii) *Project Applicant Proposed Alternative Compliance Projects*~~

~~The Copermittee may allow one or more Priority Development Project applicant(s) to propose and implement alternative compliance projects to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the alternative compliance projects are consistent with, and will address the highest water quality priorities of the Water Quality Improvement Plan, and comply with the requirements of Provision E.3.c.(3)(a).~~

(c) Alternative Compliance In-Lieu Fee Option

The Copermittee may develop and implement an alternative compliance in-lieu fee option, individually or with other Copermittees and/or entities, as a means for designing, developing, constructing, operating and/or maintaining offsite alternative compliance projects under Provision E.3.c.(3)(b). Priority Development Projects allowed to utilize the alternative compliance in-lieu fee option must comply with the following conditions:

(i) The in-lieu fee must be collected and held in accordance with the Mitigation Fee Act and all other applicable development fee laws. ~~transferred to the Copermittee (for public projects) or an escrow account (for private projects) prior to the date construction of the Priority Development Project is initiated~~.

Comment [A97]: Please see Legal Comments.

(ii) If the in-lieu fee is applied to the development, design, ~~and~~ construction, operation and maintenance of offsite alternative compliance projects, the following conditions must be met:

[a] The offsite alternative compliance projects must meet ~~allow~~ the criteria identified within E.3.c.(3)(b)-, for each Priority Development Project relying on~~to comply with~~ the alternative compliance project;~~onsite BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2);~~

[b] The offsite alternative compliance projects must be constructed as soon as possible, but no later than 4 years after the certificate of occupancy is granted for the first Priority Development Project that contributed funds toward the construction of the offsite alternative compliance projects, unless a longer period of time is provided for in an approved WQIP~~authorized by the San Diego Water Board Executive Officer~~;

~~[c] The in-lieu fee for the Priority Development Project must include mitigation of the pollutant loads and increased storm water flow rates and durations that are allowed to discharge from the site before the offsite alternative compliance projects are constructed; and~~

[d] The in-lieu fee must also include the cost to operate and maintain the offsite alternative compliance projects for the anticipated life of the constructed priority development project.

(iii) If the in-lieu fee applies only~~is applied~~ to the operation and maintenance of offsite alternative compliance projects that have already been constructed, the offsite alternative compliance projects must meet~~allow~~ the requirements of E.3.c.(3)(a)(iv) and (v) as applicable, for each Priority Development Project relying on~~to comply with~~ the alternative compliance project..~~onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2).~~

(d) Alternative Compliance Water Quality Credit System Option

The Copermittee may develop and implement an alternative compliance water quality credit system option, individually or with other Copermittees and/or entities, provided that such a credit system clearly exhibits that it will not allow discharges from Priority Development Projects to cause or contribute to a net impact over and above the impact caused by projects meeting the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2). Any credit system that a Copermittee chooses to implement must be submitted to the San Diego Water Board Executive Officer for review and acceptance as part of the Water Quality Improvement Plan.

(4) Long-Term Structural BMP Maintenance

Each Copermittee must require the project applicant to submit proof of the mechanism under which ongoing long-term maintenance of all structural BMPs will be conducted.

(5) Infiltration and Groundwater Protection

(a) Structural BMPs designed to primarily function as large, centralized infiltration devices (such as large infiltration trenches and infiltration basins) must not cause or contribute to an exceedance of an applicable groundwater quality objective. At a minimum, such infiltration BMPs must be in conformance with the design criteria listed below, unless the development project applicant demonstrates to the Copermittee that one or more of the specific design criteria listed below are not necessary to protect groundwater quality. The design criteria listed below do not apply to small infiltration systems dispersed throughout a development project.

(i) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;

(ii) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration BMPs are to be used;

(iii) Infiltration BMPs must be adequately maintained to remove pollutants in storm water to the MEP;

(iv) The vertical distance from the base of any infiltration BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;

(v) The soil through which infiltration is to occur must have physical and chemical characteristics (e.g., appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses;

(vi) Infiltration BMPs must not be used for areas of industrial or light industrial activity, and other high threat to water quality land uses and activities as designated by each Copermittee, unless first treated or filtered to remove pollutants prior to infiltration; and

(vii) Infiltration BMPs must be located a minimum of 100 feet horizontally from any water supply wells.

(b) The Copermittee may develop, individually or with other Copermittees, alternative mandatory design criteria to that listed above for infiltration BMPs which are designed to primarily function as centralized infiltration devices. Before implementing the alternative design criteria in the development planning process the Copermitee(s) must:

(i) Notify the San Diego Water Board of the intent to implement the alternative design criteria submitted; and

(ii) Comply with any conditions set by the San Diego Water Board.

d. BMP DESIGN MANUAL UPDATE

Each Copermittee must update and implement its BMP Design Manual[32] pursuant to Provision F.2.b. ~~Until the Copermittee has updated its BMP Design Manual with the requirements of Provisions E.3.a-c, the Copermittee must continue implementing its current BMP Design Manual. Unless directed otherwise by the San Diego Water Board, the Copermittee must implement the BMP Design Manual within 180 days of completing the update.~~ The update of the BMP Design Manual must include the following:

Comment [A98]: This info was incorporated into F.2.b.

(1) Updated procedures to determine the nature and extent of storm water requirements applicable to a potential development or redevelopment projects. These procedures must inform project applicants of the storm water management requirements applicable to their project including, but not limited to, general requirements for all development projects, structural BMP design procedures and requirements, hydromodification management requirements, requirements specific to phased projects, and procedures specific to private developments and public improvement projects;

(2) Updated procedures to identify ~~pollutants and conditions of concern for selecting~~ the most appropriate structural BMPs that consider, at a minimum, the following:

(a) The requirements of E.3.c.(1) and (2)

~~(a)~~(b) Receiving water quality (including pollutants for which receiving waters are listed as impaired under the CWA section 303(d) List);

[32] The BMP Design Manual was formerly known as the Standard Storm Water Mitigation Plan under Order Nos. R9-2007-0001, R9-2009-0002, and R9-2010-0016.

~~(b)~~(c) Pollutants, stressors, and/or receiving water conditions that cause or contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan;

~~(c)~~(d) Land use type of the project and pollutants associated with that land use type; and

~~(d)~~(e) Pollutants expected to be present onsite.

(3) Updated procedures for designing structural BMPs, including any updated performance requirements to be consistent with the requirements of Provision E.3.c for all structural BMPs listed in the BMP Design Manual;

(4) Long-term maintenance criteria for each structural BMP listed in the BMP Design Manual; and

(5) Alternative compliance criteria, in accordance with the requirements under Provision E.3.c.(3), if the Copermittee elects to allow Priority Development Projects within its jurisdiction to utilize alternative compliance.

e. PRIORITY DEVELOPMENT PROJECT BMP IMPLEMENTATION AND OVERSIGHT

Each Copermittee must implement a program that requires and confirms structural BMPs on all Priority Development Projects are designed, constructed, and maintained to remove pollutants in storm water to the MEP.

(1) Structural BMP Approval and Verification Process

(a) Each Copermittee must require and confirm that for all Priority Development Project applications that have not received prior lawful approval by the Copermittee by 18 months after the commencement of coverage under this Order, the requirements of Provision E.3 are implemented. For project applications that have received prior lawful approval by 18 months after the commencement of coverage under this Order, the Copermittee may allow previous land development requirements to apply.

(b) Each Copermittee must identify the roles and responsibilities of their various municipal departments in implementing the structural BMP requirements, including each stage of a project from application review and approval through BMP maintenance and inspections.

(c) Each Copermittee must require and confirm that appropriate easements and ownerships are properly recorded in public records and the information is conveyed to all appropriate parties when there is a change in project or site ownership.

(d) Each Copermittee must require and confirm that prior to occupancy and/or intended use of any portion of the Priority Development Project, each structural BMP is inspected to verify that it has been constructed and is operating in compliance with all of its specifications, plans, permits, ordinances, and the requirements of this Order.

(2) Priority Development Project Inventory and Prioritization

(a) Each Copermittee must develop, maintain, and update ~~at~~regularly~~at least annually~~, a watershed-based database to track and inventory all constructed Priority Development Projects and associated structural BMPs within its jurisdiction. Inventories must be accurate and complete beginning from January 2002 for the San Diego County Copermittees, February 2003 for the Orange County Copermittees, and July 2005 for the Riverside County Copermittees~~.~~, where data is available.~~.~~ The use of an automated database system, such as GIS, is highly recommended. The database must include, at a minimum, the following information:

(i) Priority Development Project location (address and hydrologic subarea);

(ii) Descriptions of structural BMP type(s);

(iii) Date(s) of construction;

(iv) Party responsible for structural BMP maintenance;

(v) Dates and findings of structural BMP maintenance verifications; and

(vi) Corrective actions and/or resolutions when applicable.

(b) Each Copermittee must prioritize the Priority Development Projects with structural BMPs within its jurisdiction. The designation of Priority Development Projects as high priority must consider the following:

(i) The highest water quality priorities identified in the Water Quality Improvement Plan;

(ii) Receiving water quality;

(iii) Number and sizes of structural BMPs;

(iv) Recommended maintenance frequency of structural BMPs;

(v) Likelihood of operation and maintenance issues of structural BMPs;

(vi) Land use and expected pollutants generated; and

(vii) Compliance record.

(3) Structural BMP Maintenance Verifications and Inspections

Each Copermittee is required to verify that structural BMPs on each Priority

Development Project are adequately maintained, and continue to operate effectively to remove pollutants in storm water to the MEP through inspections, self-certifications, surveys, or other equally effective approaches.

(a) All (100 percent) of the structural BMPs at Priority Development Projects that are designated as high priority must be inspected directly by the Copermittee annually prior to each rainy season;

(b) For verifications performed through a means other than direct Copermittee inspection, adequate documentation must be required by the Copermittee to provide assurance that the required maintenance of structural BMPs at each Priority Development Project has been completed; and

(c) Appropriate follow-up measures (including re-inspections, enforcement, etc.) must be conducted to ensure that structural BMPs at each Priority Development Project continue to reduce pollutants in storm water to the MEP as originally designed.

f. DEVELOPMENT PROJECT ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all development projects, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

g. ~~STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS~~

~~Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the development planning program to address development and redevelopment projects that may become sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:~~

~~(5) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional BMPs, focus education, increase frequency of verifications and/or inspections, alternative compliance options);~~

~~(6) Each Copermittee must identify areas within its jurisdiction where Priority Development Projects may be allowed or should be encouraged to implement or contribute toward the implementation of alternative compliance retrofitting and/or stream, channel, or habitat rehabilitation projects;~~

~~(7) Each Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify regional alternative compliance projects that Priority Development Projects may be allowed or should be encouraged to implement or participate in implementing; and~~

Comment [A99]: This section was moved to the beginning of provision E.3.

~~(8) The strategies and/or activities must be consistent with the requirements of Provisions E.3.a-c and E.3.e-f and the strategies identified in the Water Quality Improvement Plan.~~

4. Construction Management

Each Copermittee must implement a construction management program in accordance with the strategies identified in the Water Quality Improvement Plan and includes, at a minimum, the following requirements:

Strategies to Address the Highest Priority Water Quality Conditions

Comment [A100]: This section was moved from provision E.4.f, Changes are shown in Redline

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented as part of the construction management program to address construction sites that the Copermittee has identified as potential sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional BMPs, focus education, and/or increase/decrease frequency of inspections for specific types of sites and/or activities); and

(2) The strategies and/or activities must be consistent with the requirements of Provisions E.4.c-e and the strategies identified in the Water Quality Improvement Plan.

(3) The requirements of the programs as outlined in the following sub-provisions may be modified and prioritized as appropriate for consistency with the highest water quality priorities and strategies as identified in the corresponding Water Quality improvement Plan(s).

a. Project Approval Process

Prior to issuance of any local permit(s) that allows the commencement of construction projects that involve ground disturbance or soil disturbing activities that has the reasonable potential to discharge a pollutant load to and from the MS4, as defined in each Copermittees' JRMP~~can potentially generate pollutants in storm water runoff~~, each Copermittee must:

(1) Require a ~~site-specific~~ Pollution Control Plan~~pollution control~~, construction BMP, and/or erosion and sediment control plan, to be submitted by the project applicant to the Copermittee;

(2) Confirm the Pollution Control Plan~~pollution control~~, construction BMP, and/or erosion and sediment control plan, complies with the local grading ordinance, other applicable local ordinances, and the requirements of this Order;

(3) Confirm the Pollution Control Plan~~pollution control~~, construction BMP, and/or erosion and sediment control plan, includes seasonally appropriate and effective BMPs and management measures described in Provision E.4.c, as applicable to the project; and

(4) Verify that the project applicant has obtained coverage under ~~applicable permits, including, but not limited to~~ the Construction General Permit~~, Clean Water Act Section 401 Water Quality Certification and Section 404 Permit, and California Department of Fish and Game Streambed Alteration Agreement~~.

b. Construction Site Inventory and Tracking

(1) Each Copermittee must maintain, and update ~~at least monthly~~regularly, a watershed-based inventory of all construction projects issued a local permit that allows ground disturbance or soil disturbing activities that can potentially generate pollutants in storm water runoff. The use of an automated database system, such as GIS, is highly recommended. The inventory must include:

(a) Relevant contact information for each site (e.g., name, address, phone, and email for the owner and contractor);

(b) The basic site information including location (address and hydrologic subarea), Waste Discharge Identification (WDID) number (if applicable), size of the site, and approximate area of disturbance;

(c) Whether or not the site is considered a high threat to water quality, as defined in Provision E.4.b.(2) below;

(d) The project start and ~~anticipated~~ completion dates;

~~(e) Current construction phase;~~

~~(f)~~(e) The required inspection frequency, as defined in the Copermittee's jurisdictional runoff management program document;

~~(g)~~(f) The date the Copermittee accepted and/or approved the ~~site-specific~~ pollution control plan, construction BMP, and/or erosion and sediment control plan; and

~~(h)~~(g) Whether or not there are ongoing enforcement actions administered to the site.

Comment [A101]: Some of the info can only be updated based on an inspection, which may or may not be monthly year round for all sites.

Comment [A102]: The anticipated completion date is often unknown and can fluctuate based on unpredictable and unforeseen circumstances. Keeping track of accurate dates in an inventory would be difficult and would not add significant value to the database. Construction Inspectors keep a close eye on the progress of projects and would not need to rely on inventory data to achieve effective stormwater management and oversight. Once a project is completed, the date can be entered into the database,.

(2) Each Copermittee must identify all construction sites within its jurisdiction that represent a high threat to downstream surface water quality. The designation of construction sites as high threat to water quality must consider the following:

(a) Sites located within a hydrologic subarea where sediment is known or suspected to contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan;

(b) Sites located within the same hydrologic subarea and tributary to a water body segment listed as impaired for sediment on the CWA section 303(d) List;

(c) Sites located within, directly adjacent to, or discharging directly to a receiving water within an ESA; and

(d) Other sites determined by the Copermittees or the San Diego Water Board as a high threat to water quality.

c. CONSTRUCTION SITE BMP IMPLEMENTATION

Comment [A103]: See discussion in section 3.9.1 of the comment letter.

Each Copermittee must implement, or require the implementation of effective BMPs (for Copermittee construction sites and private construction sites, respectively) to reduce discharges of pollutants in ~~storm water~~ runoff from construction sites to the MEP, and effectively prohibit~~prevent~~ non-storm water discharges from construction sites into the MS4. These BMPs must be site specific, seasonally appropriate, and construction phase appropriate. BMPs must be implemented at each construction site year round. Dry season BMP implementation must plan for and address unseasonal rain events that may occur during the dry season (May 1 through September 30). Copermittees must implement, or require the implementation of, BMPs in the following categories:

(1) Project Planning;

(2) Good Site Management “Housekeeping”, including waste management;

(3) Non-storm Water Management;

(4) Erosion Control;

(5) Sediment Control;

(6) Run-on and Run-off Control; and

(7) Active/Passive Sediment Treatment Systems, where applicable.

d. CONSTRUCTION SITE INSPECTIONS

Each Copermittee must conduct construction site inspections to require and confirm compliance with its local permits and applicable local ordinances, and the requirements of this Order. Priority for site inspections must consider threat to water quality pursuant to Provision E.4.b as well as the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.

(1) Inspection Frequency

(a) Each Copermittee must conduct inspections at all inventoried sites, including high threat to water quality sites, at an appropriate frequency for each phase of construction to confirm~~ensure~~ the site reduces the discharge of pollutants in runoff~~storm water~~ from construction sites to the MEP, and effectively prevents non-storm water discharges from entering the MS4.

(b) Each Copermittee must establish appropriate inspection frequencies for high threat to water quality sites, and all other sites, for each phase of construction. Inspection frequencies appropriate for addressing the highest water quality priorities identified in the Water Quality Improvement Plan, and for complying with the requirements of this Order must be identified in each Copermittee's jurisdictional runoff management program document.

(c) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e., re-inspection, enforcement) necessary to require and confirm site compliance with its local permits and applicable local ordinances, and the requirements of this Order.

(2) Inspection Content

Inspections of construction sites by the Copermittee must include, at a minimum:

(a) Verification of coverage under the Construction General Permit (Notice of Intent (NOI) and/or WDID number) during initial inspections, when applicable;

(b) Assessment of compliance with its local permits and applicable local ordinances related to pollution prevention, including the implementation and maintenance of applicable BMPs;

(c) Assessment of BMP adequacy and effectiveness;

(d) Visual observations of actual non-storm water discharges;

(e) Visual observations of actual or potential discharge of sediment and/or construction related materials from the site;

(f) Visual observations of actual or potential illicit connections; and

(g) If any violations are found and BMP corrections are needed, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried construction sites. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must include, at a minimum:

(a) Site name, location (address and hydrologic subarea), and WDID number (if applicable);

(b) Inspection date;

(c) Weather condition during~~Approximate amount of rainfall since last~~ inspection;

(d) Description of problems observed with BMPs and indication of need for BMP addition/repair/replacement and any scheduled re-inspection, and date of re-inspection;

(e) Descriptions of any other specific inspection comments which must, at a minimum, include rationales for longer compliance time;

(f) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6; and

(g) Resolution of problems noted and date problems fixed.

e. Construction Site Enforcement

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried construction sites, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

5. Existing Development Management

Comment [A104]: See discussion in section 3.10 of the comment letter.

Each Copermittee must implement an existing development management program in accordance with the strategies identified in the Water Quality Improvement Plan. ~~and includes, at a minimum, the following requirements:~~

STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Comment [A105]: Moved from sub-provision e. Changes shown in redline

Each Copermittee must implement the water quality improvement strategies, where necessary, to address areas of existing development within its jurisdiction that are identified as sources of pollutants and/or stressors contributing to the highest priority water quality conditions in the Watershed Management Area. For the existing development management program, the following strategies must be implemented:

(1) Specific Existing Development Management Program Strategies

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented within its jurisdiction to address areas of existing development that the Copermittee has identified as sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(a) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional BMPs, focus education, and/or increase/decrease frequency of inspections for specific types of facilities, areas and/or activities);

(b) The facilities and/or areas within the Copermittee's jurisdiction where the strategies and/or activities will be implemented; and

(2) The requirements of the programs as outlined in the following sub-provisions may be modified and prioritized as appropriate for consistency with the highest water quality priorities and strategies as identified in the corresponding Water Quality improvement Plan(s).~~The strategies and/or activities must be consistent with the requirements of Provisions E.5.b-d and the strategies identified in the Water Quality Improvement Plan.~~

a. EXISTING DEVELOPMENT INVENTORY AND TRACKING

Each Copermittee must maintain, and update at least annually, a watershed-based inventory of the existing development within its jurisdiction that ~~may~~has the reasonable potential to~~may~~ discharge a high priority pollutant load to and from the MS4, as defined in the Copermittee's JRMP. The use of an automated database system, such as GIS, is highly recommended. The inventory must, at a minimum, evaluate and include the following if identified as a source of a high priority pollutant~~include~~:

(1) Name, location (hydrological subarea and address, if applicable) of the following types of existing development with its jurisdiction:

(a) Commercial facilities or areas;

(b) Industrial facilities;

(c) Copermittee owned Municipal facilities, including:

(i) MS4 and related structures,[33]

(ii) Roads, streets, and highways,

(iii) Parking facilities,

(iv) Municipal airfields,

(v) Parks and recreation facilities,

(vi) Flood management projects and flood control devices and structures,

(vii) Operating or closed municipal landfills,

(viii) Publicly owned treatment works (including water and wastewater treatment plants) and sanitary sewer collection systems,

(ix) Corporate yards, including maintenance and storage yards for materials, waste, equipment, and vehicles,

(x) Hazardous waste collection facilities,

(xi) Other treatment, storage or disposal facilities for municipal waste, and

(xii) Other Copermittee owned municipal facilities that the Copermittee determines may contribute a significant high priority pollutant load to the MS4; and

(d) Residential areas, which may be designated by one or more of the following:

(i) Residential management area,

(ii) Drainage basin or area,

(iii) Land use (e.g., single family, multi-family, rural),

(iv) Neighborhood,

[33] The inventory may refer to the MS4 map required to be maintained pursuant to Provision E.2.b.(1).

(v) Common Interest Area,

(vi) Home Owner Association,

(vii) Mobile home park, and/or

(viii) Other designations accepted by the San Diego Water Board Executive Officer.

(2) A description of the facility or area, including the following information:

(a) Classification as commercial, industrial, municipal, or residential;

(b) Status of facility or area as active or inactive;

(c) Identification if a business is a mobile business;

(d) SIC Code or NAICS Code, if applicable;

(e) Industrial General Permit NOI and/or WDID number, if applicable;

(f) Identification if a residential area is or includes a Common Interest Area / Home Owner Association, or mobile home park;

(g) Identification of pollutants generated and potentially generated by the facility or area;

(h) Whether the facility or area is adjacent to an ESA;

(i) Whether the facility or area is tributary to and within the same hydrologic subarea as a water body segment listed as impaired on the CWA section 303(d) List and generates pollutants for which the water body segment is impaired; and

(j) Whether the facility or area contributes or potentially contributes to the highest priority water quality conditions identified in the Water Quality Improvement Plan.

(3) An annually updated map showing the location of inventoried existing development, watershed boundaries, and water bodies.

b. EXISTING DEVELOPMENT BMP IMPLEMENTATION AND MAINTENANCE

Each Copermittee must designate a minimum set of BMPs required for all inventoried existing development, including special event venues. The designated minimum BMPs must be specific to facility or area types and pollutant generating activities, as appropriate.

(1) Commercial, Industrial, and Municipal Facilities and Areas

(a) Pollution Prevention

Each Copermittee must require the use of appropriate pollution prevention methods by the commercial, industrial, and municipal facilities and areas in its inventoried existing development, as determined necessary by the Copermittee to address the priorities and strategies addressed in the WQIP.

(b) BMP Implementation

Comment [A106]: See discussion in section 3.10.2 of the comment letter.

Each Copermittee must ~~implement, or~~ require the implementation of, designated BMPs at commercial facilities and areas, industrial facilities, and implement designated BMPs at municipal facilities in its inventoried existing development, as determined necessary by the Copermittee to address the priorities and strategies addressed in the WQIP.

(c) BMP Operation and Maintenance

(i) Each Copermittee must properly operate and maintain, or require the proper operation and maintenance of designated BMPs at commercial facilities and areas, industrial facilities, and municipal facilities in its inventoried existing development.

(ii) Each Copermittee must implement a schedule of operation and maintenance activities for its MS4 and related structures (including but not limited to catch basins, storm drain inlets, detention basins, etc.), and verify proper operation of all its municipal structural treatment controls designed to reduce pollutants (including floatables) in storm water discharges to or from its MS4s and related drainage structures. Operation and maintenance activities may include, but is not limited to, the following:

[a] Inspections of the MS4 and related structures;
[b] Cleaning of the MS4 and related structures; and
[c] Proper disposal of materials removed from cleaning of the MS4 and related structures.

(iii) Each Copermittee must implement a schedule of operation and maintenance for public streets, unpaved roads, paved roads, and paved highways and freeways within its jurisdiction to minimize pollutants that can be discharged in storm water.

(iv) Each Copermittee must implement the following controls to prevent infiltration of sewage into the MS4 from leaking sanitary sewers:

[a]~~.~~ Copermittees that operate both a municipal sanitary sewer system and a MS4 must implement controls and measures to

prevent and eliminate seeping sewage from infiltrating the MS4.

[b] Copermittees that do not operate both a municipal sanitary sewer system and a MS4 must coordinate with sewering agencies to keep themselves informed of relevant and appropriate maintenance activities and sanitary sewage projects in their jurisdiction that may cause or contribute to seepage of sewage into the MS4.

(d) Pesticides, Herbicides, and Fertilizers BMPs

Comment [A107]: See discussion in section 3.10.2 of the comment letter.

Each Copermittee must ~~implement BMPs, or~~ require the implementation of BMPs, to reduce pollutants in runoff~~storm water~~ discharges to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from commercial facilities and areas, industrial facilities;~~,~~ and implement such BMPs at municipal facilities in its inventoried existing development. Such BMPs must include, as appropriate, educational activities, permits, certifications and other measures for applicators and distributors.

(2) Residential Areas

(a) Pollution Prevention

Each Copermittee must promote and encourage the use of pollution prevention methods, where appropriate, by the residential areas in its inventoried existing development.

(b) BMP Implementation

Each Copermittee must promote and encourage the implementation of designated BMPs at residential areas in its inventoried existing development.

(c) BMP Operation and Maintenance

Each Copermittee must properly operate and maintain, or require the proper operation and maintenance of designated BMPs at residential areas in its inventoried existing development.

(d) Pesticides, Herbicides, and Fertilizers BMPs

Each Copermittee must promote and encourage the implementation of BMPs to reduce pollutants in runoff~~storm water~~ discharges to the MEP and effectively prohibit non-storm water discharges associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from residential areas in its inventoried existing development.

c. EXISTING DEVELOPMENT INSPECTIONS

Each Copermittee must conduct inspections of inventoried existing development that have been identified by the Copermittee as having the reasonable potential to discharge pollutant loads from their MS4, to ensure compliance with applicable local ordinances and permits, and the requirements of this Order.

(1) Inspection Frequency

(a) Each Copermittee must establish appropriate inspection frequencies for inventoried existing development in accordance with the following requirements:

(i) At a minimum, inventoried existing development must be inspected once every five years utilizing one or more of the following methods:

[a] Drive-by inspections by Copermittee municipal and contract staff,
[b] Onsite inspections by Copermittee municipal and contract staff, and/or
[c] Inspections by volunteer monitoring or patrol programs trained by the Copermittee;

(ii) The frequency of inspections must be appropriate to confirm that BMPs are being implemented to reduce the discharge of pollutants in runoff~~storm water~~ from the MS4 to the MEP and effectively prohibit non-storm water discharges to the MS4;

(iii) The frequency of inspections must be based on the potential for a facility or area to discharge non-storm water and pollutants in storm water, and should reflect the priorities set forth in the Water Quality Improvement Plan;

~~(iv) Each Copermittee must annually perform onsite inspections of an equivalent of at least 20 percent of the commercial facilities and areas, industrial facilities, and municipal facilities in its inventoried existing development;[34] and~~

~~(v)~~(iv) Inventoried existing development must be inspected by the Copermittee, as needed, in response to valid public complaints and findings from the Copermittee's municipal and contract staff or volunteer monitoring or patrol program inspections.

(b) Based upon inspection findings, each Copermittee must implement all follow-up actions (i.e. education and outreach, re-inspection, enforcement) necessary to require and confirm compliance with its applicable local

~~[34] If any commercial, industrial, or municipal facilities or areas require multiple onsite inspections during any given year, those additional inspection may count toward the total annual inspection requirement. This requirement excludes linear municipal facilities (i.e., MS4, streets, roads and highways).~~

Comment [A108]: Recommend keeping this instead of SD proposed 'during the permit term'. The 'during the permit term' language is problematic for businesses that are added to the inventory during the permit term. For example, if a business is added to the inventory one month before the expiration of the permit, it may not be reasonable to expect it to be immediately inspected. It is also problematic for Riverside (and OC?), who may be added to the permit less than two years before the end of the permit term.

Comment [A109]: See discussion in section 3.10.2 of the comment letter.

ordinances and permits and the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

(2) Inspection Content

(a) Inspections of existing development by the Copermittee or volunteer monitoring or patrol programs must include, at a minimum:

(i) Visual inspections for actual non-storm water discharges, if present;

(ii) Visual inspections for actual or potential discharge of pollutants, if present;

(iii) Visual inspections for actual or potential illicit connections, if present; and

(iv) Verification that the description of the facility or area in the inventory, required pursuant to Provision E.5.a.(2), has not changed.

(b) Onsite inspections of existing development by the Copermittee must include, at a minimum:

(i) Assessment of compliance with its applicable local ordinances and permits related to non-storm water and storm water discharges and runoff;

(ii) Assessment of the implementation of the designated BMPs;

(iii) Verification of coverage under the Industrial General Permit, when applicable; and

(iv) If any problems or violations are found, inspectors must take and document appropriate actions in accordance with the Enforcement Response Plan pursuant to Provision E.6.

(3) Inspection Tracking and Records

Each Copermittee must track all inspections and re-inspections at all inventoried existing development. The Copermittee must retain all inspection records in an electronic database or tabular format, which must be made available to the San Diego Water Board upon request. Inspection records must include, at a minimum:

(a) Name and location of facility or area (address and hydrologic subarea) consistent with the inventory name and location, pursuant to Provision E.5.a.(1);

(b) Inspection and re-inspection date(s);

(c) Inspection method(s) (i.e. drive-by, onsite);

(d) Observations and findings from the inspection(s);

(e) For onsite inspections of existing development by Copermittee municipal or contract staff, the records must also include, as applicable:

(i) Description of any problems or violations found during the inspection(s),

(ii) Description of enforcement actions issued in accordance with the Enforcement Response Plan pursuant to Provision E.6, and

(iii) The date problems or violations were resolved.

d. EXISTING DEVELOPMENT ENFORCEMENT

Each Copermittee must enforce its legal authority established pursuant to Provision E.1 for all its inventoried existing development, as necessary, to achieve compliance with the requirements of this Order, in accordance with its Enforcement Response Plan pursuant to Provision E.6.

e. RETROFITTING AND REHABILITATION~~STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS~~

~~Each Copermittee must implement the water quality improvement strategies, where necessary, to address areas of existing development within its jurisdiction that are identified as sources of pollutants and/or stressors contributing to the highest priority water quality conditions in the Watershed Management Area. For the existing development management program, the following strategies must be implemented:~~

~~(3) Specific Existing Development Management Program Strategies~~

~~Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented within its jurisdiction to address areas of existing development that the Copermittee has identified as sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:~~

~~(a) Provide specific details about how the strategies and/or activities will be implemented (e.g. designate additional BMPs, focus education, and/or increase/decrease frequency of inspections for specific types of facilities, areas and/or activities);~~

~~(b) The facilities and/or areas within the Copermittee's jurisdiction where the strategies and/or activities will be implemented; and~~

~~(c)~~(a) ~~The strategies and/or activities must be consistent with the requirements of Provisions E.5.b-d and the strategies identified in the Water Quality Improvement Plan.~~

~~(4)~~(3) Retrofitting Areas of Existing Development

Where identified in the WQIP as a required strategy to address the highest priority water quality conditions, each~~Each~~ Copermittee must describe in its jurisdictional runoff management program document, a program to retrofit areas of existing development within its jurisdiction to address identified sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area. The program must be implemented as follows:

(a) Each Copermittee must, where necessary pursuant to the strategies identified in the WQIP, identify areas of existing development as candidates for retrofitting, focusing on areas where retrofitting will address pollutants and/or stressors that contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan;

(b) Candidates for retrofitting projects may be utilized to reduce pollutants that may be discharged in storm water from areas of existing development, and/or address storm water runoff flows and durations from areas of existing development that cause or contribute to hydromodification in receiving waters;

(c) Each Copermittee must develop a strategy to facilitate the implementation of retrofitting projects, where needed in areas of existing development identified as candidates;

(d) Each Copermittee should identify areas of existing development where Priority Development Projects may be allowed or should be encouraged to implement or contribute toward the implementation of alternative compliance retrofitting projects; and

(e) Where retrofitting projects within specific areas of existing development are determined to be infeasible to address the highest priority water quality conditions in the Water Quality Improvement Plan, the Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify, develop, and implement regional retrofitting projects (i.e. projects that can receive and/or treat storm water from one or more areas of existing development and will result in a net benefit to water quality and the environment) adjacent to and/or downstream of the areas of existing development.

~~(5)~~(4) Stream, Channel and/or Habitat Rehabilitation in Areas of Existing Development

Where identified in the WQIP as a required strategy to address the highest priority water quality conditions, each~~Each~~ Copermittee must describe in its jurisdictional runoff management program document, a program to rehabilitate streams, channels, and/or habitats in areas of existing development within its jurisdiction to address the highest priority water quality conditions in the Watershed Management Area. The program must be implemented as follows:

(a) Each Copermittee must, where necessary pursuant to the strategies identified in the WQIP, identify streams, channels, and/or habitats in areas of existing development as candidates for rehabilitation, focusing on areas where stream, channel, and/or habitat rehabilitation projects will address the highest priority water quality conditions identified in the Water Quality Improvement Plan;

(b) Candidates for stream, channel, and/or habitat rehabilitation projects may be utilized to address storm water runoff flows and durations from areas of existing development that cause or contribute to hydromodification in receiving waters, rehabilitate channelized or hydromodified streams, restore wetland and riparian habitat, restore watershed functions, and/or ~~restore~~ protect beneficial uses of receiving waters;

(c) Each Copermittee must develop a strategy to facilitate the implementation of stream, channel, and/or habitat rehabilitation projects, where needed, in areas of existing development identified as candidates;

(d) Each Copermittee should identify areas of existing development where Priority Development Projects may be allowed or should be encouraged to implement or contribute toward the implementation of alternative compliance stream, channel, and/or habitat rehabilitation projects; and

(e) Where stream, channel, and/or habitat rehabilitation projects within specific areas of existing development are determined to be infeasible to address the highest priority water quality conditions in the Water Quality Improvement Plan, the Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify, develop, and implement regional stream, channel, and/or habitat rehabilitation projects (i.e. projects that can receive storm water from one or more areas of existing development and will result in a net benefit to water quality and the environment).

(5) Upon Regional Board Executive Officer approval the Copermittees may reallocate resources in the WQIPs for retrofit and rehabilitation project(s).

6. Enforcement Response Plans

Each Copermittee must develop and implement an Enforcement Response Plan as part of its jurisdictional runoff management program document. The Enforcement Response Plan must describe the applicable approaches and options to enforce its legal authority established pursuant to Provision E.1, as necessary, to achieve compliance with the requirements of this Order. Copermittees may continue to utilize and implement established, equivalent guidelines and procedures for enforcement. If such equivalent guidelines and procedures have not been developed, ~~T~~the Enforcement Response Plan must include the following:

a. Enforcement Response Plan Components

The Enforcement Response Plan must include the following individual components:

(1) Illicit Discharge Detection and Elimination Enforcement Component;

(2) Development Planning Enforcement Component;

(3) Construction Management Enforcement Component; and

(4) Existing Development Enforcement Component.

b. Enforcement Response Approaches and Options

Each component of the Enforcement Response Plan must describe the enforcement response approaches that the Copermittee will implement to compel compliance with its statutes, ordinances, permits, contracts, orders, or similar means, and the requirements of this Order. The description must include the protocols for implementing progressively stricter enforcement responses. The enforcement response approaches must include appropriate sanctions, as legally appropriate, to compel compliance, including, at a minimum, the following tools or their equivalent:

(1) Verbal and written notices of violation;

(2) Cleanup requirements;

(3) Fines;

(4) Bonding requirements;

(5) Administrative and criminal (if intentional or criminally negligent) penalties;

(6) Liens;

(7) Stop work orders; and

(8) Permit and occupancy denials.

c. CORRECTION OF VIOLATIONS

(1) Violations must be corrected in a timely manner with the goal of correcting the violations within 30 calendar days after the violations are discovered, or prior to the next predicted rain event, whichever is sooner.

(2) The status of the enforcement actions~~If more than 30 calendar days are required to achieve compliance, then a rationale~~ must be recorded and updated in the applicable electronic database or tabular system used to track violations.

d. ~~ESCALATED~~ PROGRESSIVE ENFORCEMENT

(1) The Enforcement Response Plan must include a definition of "~~escalated~~ progressive enforcement." ~~Escalated~~ Progressive enforcement must include a series of enforcement actions that match the severity of the violations and include distinct, progressive steps. ~~any enforcement scenario where a violation or other non-compliance is determined to cause or contribute to the highest priority water quality conditions identified in the Water Quality Improvement Plan~~. ~~Escalated~~ Progressive enforcement may be defined differently for development planning, construction sites, commercial facilities or areas, industrial facilities, municipal facilities, and/or residential areas.

(2) Where the Copermittee determines ~~escalated~~ the identified progressive enforcement steps ~~is~~are not required, a rationale must be recorded in the applicable electronic database or tabular system used to track violations.

(3) ~~Escalated~~ Progressive enforcement actions must continue to increase in severity, as necessary, to compel compliance as soon as possible.

e. REPORTING OF NON-COMPLIANT SITES

(1) Each Copermittee must notify the San Diego Water Board in writing within ~~2~~25 calendar~~2 working~~ days of issuing escalated enforcement (as defined in the Copermittee's Enforcement Response Plan) to a construction site that poses a significant threat to water quality as a result of violations or other non-compliance with its permits and applicable local ordinances, and the requirements of this Order. Written notification may be provided electronically by email.

Comment [A110]: This is just asking for paperwork violations if someone forgets to write a specific justification – even if all appropriate steps are being diligently pursued. Request alternatively to simply require that the status be updated as appropriate.

Comment [A111]: See discussion in section 3.11.2 of the comment letter.

(2) Each Copermittee must notify the San Diego Water Board of non-filers under the Industrial General Permit and Construction General Permit by email to Nonfilers_R9@waterboards.ca.gov.

7. Public Education and Participation

Each Copermittee must implement, individually or with other Copermittees, a public education and participation program in accordance with the strategies identified in the Water Quality Improvement Plan to promote and encourage the development of programs, management practices, and behaviors that reduce the discharge of pollutants in runoff~~storm water~~ to the MEP, prevent controllable non-storm water discharges from entering the MS4, and protect water quality standards in receiving waters.

STRATEGIES TO ADDRESS THE HIGHEST PRIORITY WATER QUALITY CONDITIONS

Comment [A112]: Recommended move from (c)

Each Copermittee must describe in its jurisdictional runoff management program document the strategies and/or activities that will be implemented within its jurisdiction, as applicable, to educate the public and encourage public participation to address potential sources of pollutants and/or stressors that contribute to the highest priority water quality conditions in the Watershed Management Area as follows:

(1) The target audiences and/or areas within the Copermittee's jurisdiction where the strategies and/or activities will be implemented;

(2) Provide specific details about how the strategies and/or activities will be implemented (e.g. educational topics, materials and/or activities, public outreach and participation programs and/or opportunities);

(3) Each Copermittee should collaborate and cooperate with other Copermittees and/or entities in the Watershed Management Area to identify and implement regional public education and participation activities, programs and opportunities;

(4) Each Copermittee must incorporate a mechanism for evaluating and assessing educational and other public outreach activities, as needed, to identify progress and incorporate modifications necessary to increase the effectiveness of the public education and participation program.

(5) The requirements of the programs as outlined in the following sub-provisions

may be modified and prioritized as appropriate for consistency with the highest water quality priorities and strategies as identified in the corresponding Water Quality improvement Plan(s).

a. **PUBLIC EDUCATION**

The public education program component implemented within the Copermittee's jurisdiction must include, at a minimum, the following:

(1) Educational activities, public information activities, and other appropriate outreach activities intended to reduce pollutants associated with the ~~application of pesticides, herbicides and fertilizer and other pollutants of concern in storm water discharges to and from its MS4 to the MEP, as determined and prioritized by the Copermittee(s) by jurisdiction and/or watershed to address the~~ highest priority water quality conditions identified in the Water Quality Improvement Plan;

(2) Educational activities, public information activities, and other appropriate outreach activities to facilitate the proper management and disposal of used oil and toxic materials; and

(3) Appropriate education and training measures for specific target audiences, such as construction site operators, residents, underserved target audiences and school-aged children, as determined and prioritized by the Copermittee(s) by jurisdiction and/or watershed, based on high risk behaviors and pollutants of concern.

b. **PUBLIC PARTICIPATION**

The public participation program component implemented within the Copermittee's jurisdiction must include, at a minimum, the following:

(1) A process for members of the public to participate in updating the highest priority water quality conditions, numeric goals, and water quality improvement strategies in the Water Quality Improvement Plan.

(2) Opportunities for members of the public to participate in providing the Copermittee recommendations for improving the effectiveness of the water quality improvement strategies implemented within its jurisdiction.

(3) Opportunities for members of the public to participate in programs and/or activities that can result in the prevention or elimination of non-storm water discharges to the MS4, reduction of pollutants in ~~storm wate~~r discharges from

the MS4, and/or ~~restoration and~~ protection of the quality of receiving waters.

8. Fiscal Analysis

a. ~~Each Copermittee must secure the resources necessary to meet all the requirements of this Order~~.

b. Each Copermittee must conduct an annual fiscal analysis of its jurisdictional runoff management program in its entirety. The fiscal analysis must include the following:

(1) Identification of the various categories of expenditures necessary to implement the requirements of this Order, including a description of the specific capital, operation and maintenance, and other expenditure items to be accounted for in each category of expenditures;

(2) The staff resources needed and allocated to meet the requirements of this Order, including any development, implementation, and enforcement activities required;

(3) The estimated expenditures for Provisions E.8.b.(1) and E.8.b.(2) for the current fiscal year; and

(4) The source(s) of funds that are proposed to meet the necessary expenditures described in Provisions E.8.b.(1) and E.8.b.(2), including legal restrictions on the use of such funds, for the current fiscal year and next fiscal year.

c. Each Copermittee must submit a summary of the annual fiscal analysis with each Annual Report required pursuant to Provision F.3.b.

d. Each Copermittee must provide the documentation used to develop the summary of the annual fiscal analysis upon request by the San Diego Water Board.

Comment [A113]: Since the monitoring period is different than a fiscal year, we won't be able to consistently and accurately report monitoring costs incurred by the Copermittees. (which are a big part of overall budgets)

Comment [A114]: Please see Legal Comments.

F. REPORTING

Comment [A115]: See discussion in section 3.14 of the comment letter.

The purpose of this provision is to determine and document compliance with the requirements set forth in this Order. The goal of reporting is to communicate to the San Diego Water Board and the people of the State of California the implementation status of each jurisdictional runoff management program and compliance with the requirements of this Order. This goal is to be accomplished through the submittal of specific deliverables to the San Diego Water Board by the Copermittees.

1. Water Quality Improvement Plans

Comment [A116]: See discussion in section 3.14.1 of the comment letter.

The Copermittees for each Watershed Management Area must develop and submit the Water Quality Improvement Plan in accordance with the following requirements:

a. WATER QUALITY IMPROVEMENT PLAN DEVELOPMENT

Each Water Quality Improvement Plan must be developed in accordance with the following process:

(1) Priority Water Quality Conditions and Numeric Goals

(a) The Copermittees must implement a public participation process to solicit data and information to be utilized in the development and identification of the priority water quality conditions for the Watershed Management Area.

(b) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the development of the priority water quality conditions and numeric goals to be included in the Water Quality Improvement Plan.

(c) Within 6 months after the commencement of coverage under this Order, the Copermittees must develop and submit the Water Quality Improvement Plan requirements of Provision B.2 to the San Diego Water Board. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 60 days.

(d) The Copermittees must revise the priority water quality conditions and numeric goals based on comments received and/or recommendations or direction from the San Diego Water Board Executive Officer.

(2) Water Quality Improvement Strategies and Schedules

(a) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the development of the water quality improvement strategies and schedules to be included in the Water Quality Improvement Plan.

(b) Within 9 months after receipt~~the commencement~~ of public comments and/or recommendations from the Executive Officer per (1)(c) above~~coverage under this Order~~, the Copermittees must develop and submit the Water Quality Improvement Plan requirements of Provision B.3 to the San Diego Water Board. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 60 days.

(c) The Copermittees must revise the water quality improvement strategies and schedules based on comments received and/or recommendations or direction from the San Diego Water Board Executive Officer.

b. Water Quality Improvement Plan Submittal

(1) Within 6~~18~~ months after receipt~~the commencement~~ of public comments and/or recommendations from the Executive Officer per (2)(c) above~~coverage under this Order~~, the Copermittees for each Watershed Management Area must submit a complete Water Quality Improvement Plan in accordance with the requirements of Provision B to the San Diego Water Board. The San Diego Water Board will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 30 days.

(2) Based on the comments received, the San Diego Water Board will determine whether to hold a public hearing or to limit public input to submittal of written comments. If no hearing is held the San Diego Water Board will notify the Copermittees within 6 months that the Water Quality Improvement Plan has been accepted as complete following its review and determination that the Water Quality Improvement Plan meets the requirements of this Order.

(3) The Copermittees must revise the Water Quality Improvement Plan based on comments received and/or recommendations or direction from the San Diego Water Board Executive Officer.

(4) The Water Quality Improvement Plan must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of acceptance by the San Diego Water Board.

(5) Copermittees must commence with implementation of the BMP strategies identified in the Water Quality Improvement Plan no later than the fiscal year (July 1) following San Diego Water Board approval of the Water Quality Improvement Plan, and the monitoring strategies identified in the Water Quality Improvement Plan no later than October 1st (or May 1st, whichever is sooner) following the San Diego Water Board approval of the Water Quality Improvement Plan.

2. Updates

a. Jurisdictional Runoff Management Program Document Updates

Each Copermittee must update its jurisdictional runoff management program document in accordance with the following requirements:

(1) Each Copermittee is encouraged to involve the public and key stakeholders as early and often as possible to solicit recommendations for updates to its jurisdictional runoff management program document.

(2) Each Copermittee must update its jurisdictional runoff management program document to incorporate the requirements of Provision E and the strategies identified in the applicable WQIPs no later than 6~~18~~ months after approval~~the commencement~~ of the applicable Water Quality Improvement Plans (or updates thereto).~~coverage under this Order.~~

(3) The updated JRMP document must be implemented beginning July 1st following completion of the update, unless directed otherwise by the Executive Officer.

~~(3)~~(4) Each Copermittee must submit any subsequent updates to its jurisdictional runoff management program, with a rationale for the modifications, either in the Annual Report required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b.

~~(4)~~(5) The Copermittee must revise the modifications as directed by the San Diego Water Board Executive Officer.

~~(5)~~(6) Updated jurisdictional runoff management program documents must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of submitting the Annual Report.

b. BMP Design Manual Updates

Each Copermittee must update its BMP Design Manual in accordance with the following requirements:

(1) Each Copermittee must update its BMP Design Manual to incorporate the requirements of Provisions E.3.a-d, and E.3.g. no later than 6~~18~~ months after approval~~the commencement~~ of the applicable Water Quality Improvement Plans..

(2) Unless directed otherwise by the San Diego Water Board, the Copermittee must implement the updated BMP Design Manual within 180 days of

Comment [A117]: See discussion in section 3.14.1 of the comment letter.

Comment [A118]: This is necessary for the WQIP strategies to inform the Development Planning process

Comment [A119]: An implementation date was missing from the Tentative Order completing updates to the BMP Design Manual.

~~(1)~~(3) Until the Copermittee begins implementation of its updated BMP Design Manual, the Copermittee must continue implementing its current BMP Design Manual~~coverage under this Order~~.

Comment [A120]: This was moved to here

~~(2)~~(4) Subsequent updates must be consistent with the requirements of Provisions E.3.a-d and must be submitted as part of the Annual Reports required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b.

~~(3)~~(5) Updated BMP Design Manuals must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of completing the update.

c. Water Quality Improvement Plan Updates

The Water Quality Improvement Plans must be updated in accordance with the following process:

(1) The Copermittees must implement a public participation process to solicit data and information to be utilized in updating the Water Quality Improvement Plan.

(2) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the updates to the Water Quality Improvement Plan.

(3) The Copermittees for each Watershed Management Area must submit requested updates to the Water Quality Improvement Plan, with the public input received and the rationale for the requested updates, either in the Annual Reports required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b. The requested updates are considered accepted by the San Diego Water Board if no response is provided to the Copermittee after 3 months of submitting the request.

(4) The Copermittees must revise the requested updates as directed by the San Diego Water Board Executive Officer.

(5) Updated Water Quality Improvement Plans must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of acceptance of the requested updates by the San Diego Water Board.

3. Progress Reporting

Comment [A121]: See discussion in section 3.14.1 of the comment letter.

a. PROGRESS REPORT PRESENTATIONS

The Copermittees for each Watershed Management Area must appear before the San Diego Water Board, as requested by the San Diego Water Board, to provide progress reports on the implementation of the Water Quality Improvement Plan and jurisdictional runoff management programs.

b. ANNUAL REPORTS

Comment [A122]: See discussion in section 3.14.1 of the comment letter.

(1) Transitional Period JRMP Reports: Each Copermittee must complete and submit a Jurisdictional Runoff Management Program Annual Report Form (Attachment D or accepted revision) no later than October 31 of each year prior to the implementation of updated JRMP programs pursuant to F.2.a. Each Copermittee must submit the information on the Jurisdictional Runoff Management Program Annual Report Form specific to the area within its jurisdiction in each Watershed Management Area.

(2) Transitional Period Monitoring Report: The transitional period monitoring conducted pursuant to D.1.a and D.2.a. shall be reported in a single report that covers the entire reporting period from the initiation of the transitional period monitoring (as described in D.1.a and D.2.a.), through September 30th following approval of the Water Quality Improvement Plan. The Transitional Period Monitoring Report shall include the assessments required per D.4.a.(1)(a), D.4.b.(1)(a) and D.4.b.(2)(a); and be submitted by January 31st following completion of the above mentioned transitional period.

~~(1)~~(3) Post-Transitional Annual Reports – Following the initial transitional period after enrollment into this Order, the~~The~~ Copermittees for each Watershed Management Area must submit an combined Annual Report for each reporting period no later than January 31 of the following year. The annual reporting period consists of two periods: 1) July 1 to June 30 of the following year for the jurisdictional runoff management programs, 2) October 1 to September 30 of the following year for the monitoring and assessment programs~~. The first Annual Report must be prepared for the reporting period beginning July 1 after commencement of coverage under this Order, and upon San Diego Water Board determination that the Water Quality Improvement Plan meets the requirements of this Order to June 30 in the following year for the jurisdictional runoff management programs, and September 30 in the following year for the monitoring and assessment programs.~~ Annual Reports must be made available on the Regional Clearinghouse required pursuant to Provision F.4. Each Annual Report must include the following:

(a) The receiving water and MS4 outfall discharge monitoring data collected pursuant to Provisions D.1 and D.2, summarized and presented in tabular and graphical form;

(b) Progress of the special studies required pursuant to Provision D.3, and the results or findings when a special study, or each phase of a special study, is completed;

(c) The findings from the applicable assessments required pursuant to Provision D.4;

Comment [A123]: Not all are required annually.

(d) The progress of implementing the Water Quality Improvement Plan, including, but not limited to, the following:

(i) The progress toward achieving the interim and final numeric goals for the highest water quality priorities for the Watershed Management Area,

(ii) The water quality improvement strategies that were implemented and/or no longer implemented by each of the Copermittees during the reporting period and previous reporting periods, and are planned to be implemented during the next reporting period,

(iii) Proposed modifications to the water quality improvement strategies, with public input received and rationale for the proposed modifications,

(iv) Previously proposed modifications or updates incorporated into the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document and implemented by the Copermittees in the Watershed Management Area, and

(v) Proposed modifications or updates to the Water Quality Improvement Plan and/or each Copermittee's jurisdictional runoff management program document;

(e) A completed Jurisdictional Runoff Management Program Annual Report Form (Attachment D or accepted revision) for each Copermittee in the Watershed Management Area, certified by a Principal Executive Officer, Ranking Elected Official, or Duly Authorized Representative.

~~(2) Each Copermittee must complete and submit a Jurisdictional Runoff Management Program Annual Report Form (Attachment D or accepted revision) no later than October 31 of each year until the first Annual Report is required to be submitted. Each Copermittee must submit the information on the Jurisdictional Runoff Management Program Annual Report Form specific to the area within its jurisdiction in each Watershed Management Area.~~

Comment [A124]: Adapted into new section (1)

~~(3)~~(4) Each Copermittee must provide any data or documentation utilized in developing the Annual Report upon request by the San Diego Water Board. ~~AnyAny~~Copermittee~~Any~~ monitoring data utilized in developing the Annual Report must be uploaded to the California Environmental Data Exchange Network (CEDEN).[35] Any Copermittee monitoring and assessment data utilized in developing the Annual Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.

c. Regional Monitoring and Assessment Report

(1) The Copermittees must submit a Regional Monitoring and Assessment Report no later than 180 days in advance of the expiration date of this Order. The Regional Monitoring and Assessment Report may be submitted as part of the Report of Waste Discharge required pursuant to Provision F.5.b. The Regional Monitoring and Assessment Report shall incorporate the Integrated Assessment of the Water Quality Improvement Plan per D.4.d.

~~(1) The Copermittees must review the receiving water and MS4 outfall discharge monitoring data collected pursuant to Provisions D.1 and D.2, and findings from the assessments required pursuant to Provision D.4, to assess the following:~~

~~(2)~~

~~(3) The beneficial uses of the receiving waters within the San Diego Region that are protected or must be restored;~~

~~(4)~~

~~(5) The progress toward restoring impacted beneficial uses in the receiving waters within the San Diego Region; and~~

~~(6)~~

~~(7) Pollutants or conditions of emerging concern that may impact beneficial uses in the receiving waters within the San Diego Region.~~

~~(8)~~

~~(9) The Regional Monitoring and Assessment Report must include recommendations for improving the implementation and assessment of the Water Quality Improvement Plans and jurisdictional runoff management programs.~~

(2) Each Copermittee must provide any data or documentation utilized in developing the Regional Monitoring and Assessment Report upon request by the San Diego Water Board. Any monitoring and assessment data utilized in developing the Regional Monitoring and Assessment Report must be provided on the Regional Clearinghouse required pursuant to Provision F.4.

[35] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

4. Regional Clearinghouse

The Copermittees must develop, update, and maintain an internet-based Regional Clearinghouse that is made available to the public no later than 18 months after the effective date of this Order.[36]

a. The Copermittees, through the Regional Clearinghouse, must make the following documents and data available, organized by Watershed Management Area, which may be linked to other internet-based data portals and databases where the original documents are stored:

(1) Water Quality Improvement Plan for the Watershed Management Area, and all updated versions with date of update;

(2) Annual Reports for the Watershed Management Area;

(3) Jurisdictional Runoff Management Program document for each Copermittee within the Watershed Management Area, and all updated versions with date of update;

(4) BMP Design Manual for each Copermittee within the Watershed Management Area, and all updated versions with date of update;

(5) Reports from special studies (e.g. source identification, BMP effectiveness assessment) conducted in the Watershed Management Area;

(6) Monitoring data collected pursuant to Provision D for each Watershed Management Area must be uploaded to CEDEN,[37] with links to the uploaded data; and

(7) Available GIS data, layers, and/or shapefiles used to develop the maps generated and maintained by the Copermittees for the Water Quality Improvement Plans, Annual Reports, and jurisdictional runoff management program documents.

b. The Copermittees, through the Regional Clearinghouse, must make the following information and documents available:

(1) Contact information (point of contact, phone number, email address, and mailing address) for each Copermittee;

[36] The Copermittee may elect to develop and maintain the clearinghouse(s) provided by other Copermittees or agencies.
[37] Data must be uploaded to CEDEN Southern California Regional Data Center (http://www.sccwrp.org/Data/DataSubmission/SouthernCaliforniaRegionalDataCenter.aspx) using the templates provided on the CEDEN website.

(2) Public hotline number for reporting non-storm water and illicit discharges for each Copermittee;

(3) Email address for reporting non-storm water and illicit discharges for each Copermittee;

(4) Link to each Copermittee's website, if available, where the public may find additional information about the Copermittee's storm water management program and for requesting records for the implementation of its program;

(5) Information about opportunities for the public to participate in programs and/or activities that can result in the prevention or elimination of non-storm water discharges to the MS4, reduction of pollutants in ~~storm water~~ discharges from the MS4, and/or restoration and protection of the quality of receiving waters; and

(6) Reports from regional monitoring programs in which the Copermittees participate (e.g. Southern California Monitoring Coalition, Southern California Coastal Water Research Project Bight Monitoring);

(7) Regional Monitoring and Assessment Reports; and

(8) Any other information, data, and documents the Copermittees determine as appropriate for making available to the public.

5. Report of Waste Discharge

a. The Orange County Copermittees and the Riverside County Copermittees are required to submit a complete Report of Waste Discharge pursuant to the requirements of their current Orders. The San Diego Water Board will review and consider the Reports of Waste Discharge to determine whether modification to this Order, pursuant to the requirements of Provision H, will be required prior the Orange County Copermittees and/or Riverside County Copermittees becoming covered under this Order. The current Orders for the Orange County Copermittees and Riverside County Copermittees are rescinded upon notification of coverage under this Order except for enforcement purposes.

b. The Copermittees subject to the requirements of this Order must submit to the San Diego Water Board a complete Report of Waste Discharge as an application for the re-issuance of this Order and NPDES permit. The Report of Waste Discharge must be submitted no later than 180 days in advance of the expiration date of this Order. The Report of Waste Discharge must contain the following minimum information:

(1) Names and addresses of the Copermittees;

(2) Names and titles of the primary contacts of the Copermittees;

(3) Proposed changes to the Copermittees' Water Quality Improvement Plans and the supporting justification;

(4) Proposed changes to the Copermittees' jurisdictional runoff management programs and the supporting justification;

(5) Any other information necessary for the re-issuance of this Order;

(6) Any information to be included as part of the Report of Waste Discharge pursuant to the requirements of this Order; and

(7) Any other information required by federal regulations for NPDES permit reissuance.

6. Application for Early Coverage

a. The Orange County Copermittees, collectively, or Riverside County Copermittees, collectively, may apply for early coverage under this Order by submitting a Report of Waste Discharge Form 200, with a written request for early coverage under this Order.

Comment [A125]: This form requests information that is not applicable to MS4s.

b. The San Diego Water Board will review the application for early coverage. A notification of coverage under this Order will be issued to the Copermittees in the respective county by the San Diego Water Board upon completion of the early coverage application requirements. The effective coverage date will be specified in the notification of coverage. The Copermittees in the respective county are authorized to have MS4 discharges pursuant to the requirements of this Order starting on the effective coverage date specified in the notification of coverage. The existing Order for the respective county is rescinded upon the effective coverage date specified in the notification of coverage except for enforcement purposes.

7. Reporting Provisions

Each Copermittee must comply with all the reporting and recordkeeping provisions of the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

G. PRINCIPAL WATERSHED COPERMITTEE RESPONSIBILITIES

1. The Copermittees within each Watershed Management Area must designate a Principal Watershed Copermittee and notify the San Diego Water Board of the name of the Principal Watershed Copermittee. ~~An individual Copermittee should not be designated a Principal Watershed Copermittee for more than two Watershed Management Areas.~~ The notification may be submitted with the Water Quality Improvement Plan required pursuant to Provision F.1 of this Order.

2. The Principal Watershed Copermittee is responsible for, at a minimum, the following:

   a. Serving as liaison between the Copermittees in the Watershed Management Area and the San Diego Water Board on general permit issues, and when necessary and appropriate, representing the Copermittees in the Watershed Management Area before the San Diego Water Board.

   b. Facilitating the development of the Water Quality Improvement Plan in accordance with the requirements of Provision B of this Order

   c. Coordinating the submittal of the deliverables required by Provisions F.1, F.2, F.3.a, and F.3.b of this Order.

   d. Coordinating the development of~~and developing~~, with the other Principal Watershed Copermittees, the requirements of Provisions F.3.c, F.4, and F.5.b of this Order.

H. MODIFICATION OF PROGRAMS

1. Modifications of the Order may be initiated by the San Diego Water Board or by the Copermittees, including as part of the ROWD process applicable to the Orange County and Riverside County Copermittees. Requests by Copermittees must be made to the San Diego Water Board.

2. Minor modifications to the Order may be made by the San Diego Water Board Executive Officer, where the proposed modification complies with all the effective prohibitions and limitations, and other requirements of this Order.

3. Proposed modifications to the Order outside of the WQIP process that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures.

4. The San Diego Water Board may re-open and modify this Order at any time prior to its expiration, after opportunity for public comment and a public hearing, if the State Water Board determines that revisions are warranted to those provisions of the Order addressing compliance with water quality standards in the receiving water and/or those provisions of the Order establishing an iterative process for implementation of management practices to assure compliance with water quality standards in the receiving water.

I. STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

Each Copermittee must comply with all the Standard Permit Provisions and General Provisions contained in Attachment B to this Order.

ATTACHMENT A

DISCHARGE PROHIBITIONS AND SPECIAL PROTECTIONS

1. Basin Plan Waste Discharge Prohibitions

California Water Code Section 13243 provides that a Regional Water Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste or certain types of waste is not permitted. The following waste discharge effective prohibitions in the Water Quality Control Plan for the San Diego Basin (Basin Plan) are applicable to any person, as defined by Section 13050(c) of the California Water Code, who is a citizen, domiciliary, or political agency or entity of California whose activities in California could affect the quality of waters of the state within the boundaries of the San Diego Region.

1. The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code Section 13050, is prohibited.

2. The discharge of waste to land, except as authorized by waste discharge requirements or the terms described in California Water Code Section 13264 is prohibited.

3. The discharge of pollutants or dredged or fill material to waters of the United States except as authorized by a National Pollutant Discharge Elimination System (NPDES) permit or a dredged or fill material permit (subject to the exemption described in California Water Code Section 13376) is prohibited.

4. Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this San Diego Water Board issues a NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State Department of Health Services (DHS) and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.

5. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the San Diego Water Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.

6. The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the San Diego Water Board.

7. The dumping, deposition, or discharge of waste directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the San Diego Water Board.

8. Any discharge to a storm water conveyance system that is not composed entirely of "*storm water*" is effectively prohibited unless authorized by the San Diego Water Board. [The federal regulations, 40 CFR 122.26(b)(13), define storm water as storm water runoff, snow melt runoff, and surface runoff and drainage. 40 CFR 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities.] [§122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].

9. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.

10. The discharge of industrial wastes to conventional septic tank/subsurface disposal systems, except as authorized by the terms described in California Water Code Section 13264, is prohibited.

11. The discharge of radioactive wastes amenable to alternative methods of disposal into the waters of the state is prohibited.

12. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.

13. The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the San Diego Water Board.

14. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.

15. The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.

16. The discharge of untreated sewage from vessels to San Diego Bay is prohibited.

17. The discharge of treated sewage from vessels to portions of San Diego Bay that are less than 30 feet deep at mean lower low water (MLLW) is prohibited.

18. The discharge of treated sewage from vessels, which do not have a properly functioning US Coast Guard certified Type I or Type II marine sanitation device, to portions of San Diego Bay that are greater than 30 feet deep at mean lower low water (MLLW) is prohibited.

2. Attachment B to State Water Board Resolution 2012-0012

Special Protections for Areas of Special Biological Significance, Governing Point Source Discharges of Storm Water and Nonpoint Source Waste Discharges

I. PROVISIONS FOR POINT SOURCE DISCHARGES OF STORM WATER AND NONPOINT SOURCE WASTE DISCHARGES

The following terms, effective prohibitions, and special conditions (hereafter collectively referred to as special conditions) are established as limitations on point source storm water and nonpoint source discharges. These special conditions provide Special Protections for marine aquatic life and natural water quality in Areas of Special Biological Significance (ASBS), as required for State Water Quality Protection Areas pursuant to California Public Resources Code Sections 36700(f) and 36710(f). These Special Protections are adopted by the State Water Board as part of the California Ocean Plan (Ocean Plan) General Exception.

The special conditions are organized by category of discharge. The State Water Resources Control Board (State Water Board) and Regional Water Quality Control Boards (Regional Water Boards) will determine categories and the means of regulation for those categories [e.g., Point Source Storm Water National Pollutant Discharge Elimination System (NPDES) or Nonpoint Source].

A. PERMITTED POINT SOURCE DISCHARGES OF STORM WATER

1. General Provisions for Permitted Point Source Discharges of Storm Water

   a. Existing storm water discharges into an ASBS are allowed only under the following conditions:

      (1) The discharges are authorized by an NPDES permit issued by the State Water Board or Regional Water Board;

      (2) The discharges comply with all of the applicable terms, effective prohibitions, and special conditions contained in these Special Protections; and

      (3) The discharges:

         (i) Are essential for flood control or slope stability, including roof, landscape, road, and parking lot drainage;

         (ii) Are designed to prevent soil erosion;

         (iii) Occur only during wet weather;

         (iv) Are composed of only storm water runoff.

   b. Discharges composed of storm water runoff shall not alter natural ocean water quality in an ASBS.

   c. The discharge of trash is effectively prohibited.

d. Only discharges from existing storm water outfalls are allowed. Any proposed or new storm water runoff discharge shall be routed to existing storm water discharge outfalls and shall not result in any new contribution of waste to an ASBS (i.e., no additional pollutant loading). "Existing storm water outfalls" are those that were constructed or under construction prior to January 1, 2005. "New contribution of waste" is defined as any addition of waste beyond what would have occurred as of January 1, 2005. A change to an existing storm water outfall, in terms of re-location or alteration, in order to comply with these special conditions, is allowed and does not constitute a new discharge.

e. Non-storm water discharges are effectively prohibited except as provided below:

(1) The term "non-storm water discharges" means any waste discharges from a municipal separate storm sewer system (MS4) or other NPDES permitted storm drain system to an ASBS that are not composed entirely of storm water.

(2) (i) The following non-storm water discharges are allowed, provided that the discharges are essential for emergency response purposes, structural stability, slope stability or occur naturally:

(a) Discharges associated with emergency fire fighting operations.

(b) Foundation and footing drains.

(c) Water from crawl space or basement pumps.

(d) Hillside dewatering.

(e) Naturally occurring groundwater seepage via a storm drain.

(f) Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.

(ii) An NPDES permitting authority may authorize non-storm water discharges to an MS4 with a direct discharge to an ASBS only to the extent the NPDES permitting authority finds that the discharge does not alter natural ocean water quality in the ASBS.

(3) Authorized non-storm water discharges shall not cause or contribute to a violation of the water quality objectives in Chapter II of the Ocean Plan nor alter natural ocean water quality in an ASBS.

2. Compliance Plans for Inclusion in Storm Water Management Plans (SWMP) and Storm Water Pollution Prevention Plans (SWPPP).

The discharger shall specifically address the effective prohibition of non-storm water runoff and the requirement to maintain natural water quality for storm water discharges to an ASBS in an ASBS Compliance Plan to be included in its SWMP or a SWPPP, as appropriate to permit type. If a statewide permit includes a SWMP, then the discharger shall prepare a stand-alone compliance plan for ASBS discharges. The ASBS Compliance Plan is subject to approval by the Executive Director of the State Water Board (statewide permits) or

Executive Officer of the Regional Water Board (for permits issued by Regional Water Boards).

a. The Compliance Plan shall include a map of surface drainage of storm water runoff, showing areas of sheet runoff, prioritize discharges, and describe any structural Best Management Practices (BMPs) already employed and/or BMPs to be employed in the future. Priority discharges are those that pose the greatest water quality threat and which are identified to require installation of structural BMPs. The map shall also show the storm water conveyances in relation to other features such as service areas, sewage conveyances and treatment facilities, landslides, areas prone to erosion, and waste and hazardous material storage areas, if applicable. The SWMP or SWPPP shall also include a procedure for updating the map and plan when changes are made to the storm water conveyance facilities.

b. The ASBS Compliance Plan shall describe the measures by which all non-authorized non-storm water runoff (e.g., dry weather flows) has been eliminated, how these measures will be maintained over time, and how these measures are monitored and documented.

c. For Municipal Separate Storm Sewer System (MS4s), the ASBS Compliance Plan shall require minimum inspection frequencies as follows:

   (1) The minimum inspection frequency for construction sites shall be weekly during rainy season;

   (2) The minimum inspection frequency for industrial facilities shall be monthly during the rainy season;

   (3) The minimum inspection frequency for commercial facilities (e.g., restaurants) shall be twice during the rainy season; and

   (4) Storm water outfall drains equal to or greater than 18 inches (457 mm) in diameter or width shall be inspected once prior to the beginning of the rainy season and once during the rainy season and maintained to remove trash and other anthropogenic debris.

d. The ASBS Compliance Plan shall address storm water discharges (wet weather flows) and, in particular, describe how pollutant reductions in storm water runoff, that are necessary to comply with these special conditions, will be achieved through BMPs. Structural BMPs need not be installed if the discharger can document to the satisfaction of the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that such installation would pose a threat to health or safety. BMPs to control storm water runoff discharges (at the end-of-pipe) during a design storm shall be designed to achieve on average the following target levels:

   (1) Table B Instantaneous Maximum Water Quality Objectives in Chapter II of the Ocean Plan; or

   (2) A 90% reduction in pollutant loading during storm events, for the applicant's total discharges. The baseline for the reduction is the effective date of the Exception. The

baseline for these determinations is the effective date of the Exception, and the reductions must be achieved and documented within four (4) years of the effective date.

e. The ASBS Compliance Plan shall address erosion control and the prevention of anthropogenic sedimentation in ASBS. The natural habitat conditions in the ASBS shall not be altered as a result of anthropogenic sedimentation.

f. The ASBS Compliance Plan shall describe the non-structural BMPs currently employed and planned in the future (including those for construction activities), and include an implementation schedule. The ASBS Compliance Plan shall include non-structural BMPs that address public education and outreach. Education and outreach efforts must adequately inform the public that direct discharges of pollutants from private property not entering an MS4 are effectively prohibited. The ASBS Compliance Plan shall also describe the structural BMPs, including any low impact development (LID) measures, currently employed and planned for higher threat discharges and include an implementation schedule. To control storm water runoff discharges (at the end-of-pipe) during a design storm, permittees must first consider using LID practices to infiltrate, use, or evapotranspirate storm water runoff on-site.

g. The BMPs and implementation schedule shall be designed to ensure that natural water quality conditions in the receiving water are achieved and maintained by either reducing flows from impervious surfaces or reducing pollutant loading, or some combination thereof.

h. If the results of the receiving water monitoring described in IV.B. of these special conditions indicate that the storm water runoff is causing or contributing to an alteration of natural ocean water quality in the ASBS, the discharger shall submit a report to the State Water Board and Regional Water Board within 30 days of receiving the results.

(1) The report shall identify the constituents in storm water runoff that alter natural ocean water quality and the sources of these constituents.

(2) The report shall describe BMPs that are currently being implemented, BMPs that are identified in the SWMP or SWPPP for future implementation, and any additional BMPs that may be added to the SWMP or SWPPP to address the alteration of natural water quality. The report shall include a new or modified implementation schedule for the BMPs.

(3) Within 30 days of the approval of the report by the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits), the discharger shall revise its ASBS Compliance Plan to incorporate any new or modified BMPs that have been or will be implemented, the implementation schedule, and any additional monitoring required.

(4) As long as the discharger has complied with the procedures described above and is implementing the revised SWMP or SWPPP, the discharger does not have to repeat the same procedure for continuing or recurring exceedances of natural ocean water quality conditions due to the same constituent.

(5) Compliance with this section does not excuse violations of any term, effective prohibition, or condition contained in these Special Protections.

3. Compliance Schedule

a. On the effective date of the Exception, all non-authorized non-storm water discharges (e.g., dry weather flow) are effectively prohibited.

b. Within one year from the effective date of the Exception, the discharger shall submit a written ASBS Compliance Plan to the State Water Board Executive Director (statewide permits) or Regional Water Board Executive Officer (Regional Water Board permits) that describes its strategy to comply with these special conditions, including the requirement to maintain natural water quality in the affected ASBS. The ASBS Compliance Plan shall include a time schedule to implement appropriate non-structural and structural controls (implementation schedule) to comply with these special conditions for inclusion in the discharger's SWMP or SWPPP, as appropriate to permit type.

c. Within 18 months of the effective date of the Exception, any non-structural controls that are necessary to comply with these special conditions shall be implemented.

d. Within four (4) years of the effective date of the Exception, any structural controls identified in the ASBS Compliance Plan that are necessary to comply with these special conditions shall be operational.

e. Within four (4) years of the effective date of the Exception, all dischargers must comply with the requirement that their discharges into the affected ASBS maintain natural ocean water quality. If the initial results of post-storm receiving water quality testing indicate levels higher than the 85th percentile threshold of reference water quality data and the pre-storm receiving water levels, then the discharger must re-sample the receiving water, pre- and post-storm. If after re-sampling the post-storm levels are still higher than the 85th percentile threshold of reference water quality data, and the pre-storm receiving water levels, for any constituent, then natural ocean water quality is exceeded. See attached Flowchart.

f. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may only authorize additional time to comply with the special conditions d. and e., above if good cause exists to do so. Good cause means a physical impossibility or lack of funding.

   If a discharger claims physical impossibility, it shall notify the Board in writing within thirty (30) days of the date that the discharger first knew of the event or circumstance that caused or would cause it to fail to meet the deadline in d. or e. The notice shall describe the reason for the noncompliance or anticipated noncompliance and specifically refer to this Section of this Exception. It shall describe the anticipated length of time the delay in compliance may persist, the cause or causes of the delay as well as measures to minimize the impact of the delay on water quality, the measures taken or to be taken by the discharger to prevent or minimize the delay, the schedule by which the measures will be implemented, and the anticipated date of compliance. The discharger shall adopt all reasonable measures to avoid and minimize such delays and their impact on water quality.

The discharger may request an extension of time for compliance based on lack of funding. The request for an extension shall require:

(1) for municipalities, a demonstration of significant hardship to discharger ratepayers, by showing the relationship of storm water fees to annual household income for residents within the discharger's jurisdictional area, and the discharger has made timely and complete applications for all available bond and grant funding, and either no bond or grant funding is available, or bond and/or grant funding is inadequate; or
(2) for other governmental agencies, a demonstration and documentation of a good faith effort to acquire funding through that agency's budgetary process.

B. NONPOINT SOURCE DISCHARGES

[NOT INCLUDED]
[PROVISIONS FOR NONPOINT SOURCE DISCHARGES NOT APPLICABLE]

II. ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES

[NOT INCLUDED]
[ADDITIONAL REQUIREMENTS FOR PARKS AND RECREATION FACILITIES NOT APPLICABLE]

III. ADDITIONAL REQUIREMENTS – WATERFRONT AND MARINE OPERATIONS

[NOT INCLUDED]
[ADDITIONAL REQUIREMENTS FOR WATERFRONT AND MARINE OPERATIONS NOT APPLICABLE]

IV. MONITORING REQUIREMENTS

Monitoring is mandatory for all dischargers to assure compliance with the Ocean Plan. Monitoring requirements include both: (A) core discharge monitoring, and (B) ocean receiving water monitoring. The State and Regional Water Boards must approve sampling site locations and any adjustments to the monitoring programs. All ocean receiving water and reference area monitoring must be comparable with the Water Boards' Surface Water Ambient Monitoring Program (SWAMP).

Safety concerns: Sample locations and sampling periods must be determined considering safety issues. Sampling may be postponed upon notification to the State and Regional Water Boards if hazardous conditions prevail.

Analytical Chemistry Methods: All constituents must be analyzed using the lowest minimum detection limits comparable to the Ocean Plan water quality objectives. For metal analysis, all samples, including storm water effluent, reference samples, and ocean receiving water samples, must be analyzed by the approved analytical method with the lowest minimum detection limits (currently Inductively Coupled Plasma/Mass Spectrometry) described in the Ocean Plan.

A. CORE DISCHARGE MONITORING PROGRAM

1. General sampling requirements for timing and storm size:

   Runoff must be collected during a storm event that is greater than 0.1 inch and generates runoff, and at least 72 hours from the previously measurable storm event. Runoff samples shall be collected when post-storm receiving water is sampled, and analyzed for the same constituents as receiving water and reference site samples (see section IV B) as described below.

2. Runoff flow measurements

   a. For municipal/industrial storm water outfalls in existence as of December 31, 2007, 18 inches (457mm) or greater in diameter/width (including multiple outfall pipes in combination having a width of 18 inches, runoff flows must be measured or calculated, using a method acceptable to and approved by the State and Regional Water Boards.
   b. This will be reported annually for each precipitation season to the State and Regional Water Boards.

3. Runoff samples – storm events

   a. For outfalls equal to or greater than 18 inches (0.46m) in diameter or width:

      (1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination, ; and

      (2) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS

      (3) If an applicant has no outfall greater than 36 inches, then storm water runoff from the applicant's largest outfall shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates).

   b. For outfalls equal to or greater than 36 inches (0.91m) in diameter or width:

      (1) samples of storm water runoff shall be analyzed during the same storm as receiving water samples for oil and grease, total suspended solids, and, within the range of the southern sea otter indicator bacteria or some other measure of fecal contamination; and

      (2) samples of storm water runoff shall be further analyzed during the same storm as receiving water samples for Ocean Plan Table B metals for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides

(pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates) and

(3) samples of storm water runoff shall be analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS.

c. For an applicant not participating in a regional monitoring program [see below in Section IV (B)] in addition to (a.) and (b.) above, a minimum of the two largest outfalls or 20 percent of the larger outfalls, whichever is greater, shall be sampled (flow weighted composite samples) at least three times annually during wet weather (storm event) and analyzed for all Ocean Plan Table A constituents, Table B constituents for marine aquatic life protection (except for toxicity, only chronic toxicity for three species shall be required), DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, and Ocean Plan indicator bacteria. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one (the largest) such discharge shall be sampled annually in each Region.

4. The Executive Director of the State Water Board (statewide permits) or Executive Officer of the Regional Water Board (Regional Water Board permits) may reduce or suspend core monitoring once the storm runoff is fully characterized. This determination may be made at any point after the discharge is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

B. OCEAN RECEIVING WATER AND REFERENCE AREA MONITORING PROGRAM

In addition to performing the Core Discharge Monitoring Program in Section II.A above, all applicants having authorized discharges must perform ocean receiving water monitoring. In order to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS, dischargers may choose either (1) an individual monitoring program, or (2) participation in a regional integrated monitoring program.

1. Individual Monitoring Program: The requirements listed below are for those dischargers who elect to perform an individual monitoring program to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within the affected ASBS. In addition to Core Discharge Monitoring, the following additional monitoring requirements shall be met:

a. Three times annually, during wet weather (storm events), the receiving water at the point of discharge from the outfalls described in section (IV)(A)(3)(c) above shall be sampled and analyzed for Ocean Plan Table A constituents, Table B constituents for marine aquatic life, DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, salinity, chronic toxicity (three species), and Ocean Plan indicator bacteria.

The sample location for the ocean receiving water shall be in the surf zone at the point of discharges; this must be at the same location where storm water runoff is sampled. Receiving water shall be sampled at approximately the same time prior to (pre-storm) and during (or immediately after) the same storm (post storm). Reference water quality shall also be sampled and analyzed for the same constituents pre-storm and post-storm, during the same storms when receiving water is sampled. Reference stations will be determined by the State Water Board's Division of Water Quality and the applicable Regional Water Board(s).

b. Sediment sampling shall occur at least three times during every five (5) year period. The subtidal sediment (sand or finer, if present) at the discharge shall be sampled and analyzed for Ocean Plan Table B constituents for marine aquatic life, DDT, PCBs, PAHs, pyrethroids, and OP pesticides. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed.

c. A quantitative survey of intertidal benthic marine life shall be performed at the discharge and at a reference site. The survey shall be performed at least once every five (5) year period. The survey design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The results of the survey shall be completed and submitted to the State Water Board and Regional Water Board at least six months prior to the end of the permit cycle.

d. Once during each five (5) year period, a bioaccumulation study shall be conducted to determine the concentrations of metals and synthetic organic pollutants at representative discharge sites and at representative reference sites. The study design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The bioaccumulation study may include California mussels (Mytilus californianus) and/or sand crabs (Emerita analoga or Blepharipoda occidentalis). Based on the study results, the Regional Water Board and the State Water Board's Division of Water Quality, may adjust the study design in subsequent permits, or add or modify additional test organisms (such as shore crabs or fish), or modify the study design appropriate for the area and best available sensitive measures of contaminant exposure.

e. Marine Debris: Representative quantitative observations for trash by type and source shall be performed along the coast of the ASBS within the influence of the discharger's outfalls. The design, including locations and frequency, of the marine debris observations is subject to approval by the Regional Water Board and State Water Board's Division of Water Quality.

f. The monitoring requirements of the Individual Monitoring Program in this section are minimum requirements. After a minimum of one (1) year of continuous water quality monitoring of the discharges and ocean receiving waters, the Executive Director of the State Water Board (statewide permits) or Executive officer of the Regional Water Board (Regional Water Board permits) may require additional monitoring, or adjust, reduce or suspend receiving water and reference station monitoring. This determination may be made at any point after the discharge and receiving water is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

2. Regional Integrated Monitoring Program: Dischargers may elect to participate in a regional integrated monitoring program, in lieu of an individual monitoring program, to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS. This regional approach shall characterize natural water quality, pre- and post-storm, in ocean reference areas near the mouths of identified open space watersheds and the effects of the discharges on natural water quality (physical, chemical, and toxicity) in the ASBS receiving waters, and should include benthic marine aquatic life and bioaccumulation components. The design of the ASBS stratum of a regional integrated monitoring program may deviate from the otherwise prescribed individual

monitoring approach (in Section IV.B.1) if approved by the State Water Board's Division of Water Quality and the Regional Water Boards.

a. Ocean reference areas shall be located at the drainages of flowing watersheds with minimal development (in no instance more than 10% development), and shall not be located in CWA Section 303(d) listed waterbodies or have tributaries that are 303(d) listed. Reference areas shall be free of wastewater discharges and anthropogenic non-storm water runoff. A minimum of low threat storm runoff discharges (e.g. stream highway overpasses and campgrounds) may be allowed on a case-by-case basis. Reference areas shall be located in the same region as the ASBS receiving water monitoring occurs. The reference areas for each Region are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean reference water samples must be collected from each station, each from a separate storm. A minimum of one reference location shall be sampled for each ASBS receiving water site sampled per responsible party. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

b. ASBS ocean receiving water must be sampled in the surf zone at the location where the runoff makes contact with ocean water (i.e. at "point zero"). Ocean receiving water stations must be representative of worst-case discharge conditions (i.e. co-located at a large drain greater than 36 inches, or if drains greater than 36 inches are not present in the ASBS then the largest drain greater than18 inches.) Ocean receiving water stations are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean receiving water samples must be collected during each storm season from each station, each from a separate storm. A minimum of one receiving water location shall be sampled in each ASBS per responsible party in that ASBS. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

c. Reference and receiving water sampling shall commence during the first full storm season following the adoption of these special conditions, and post-storm samples shall be collected when annual storm water runoff is sampled. Sampling shall occur in a minimum of two storm seasons. For those ASBS dischargers that have already participated in the Southern California Bight 2008 ASBS regional monitoring effort, sampling may be limited to only one storm season.

d. Receiving water and reference samples shall be analyzed for the same constituents as storm water runoff samples. At a minimum, constituents to be sampled and analyzed in reference and discharge receiving waters must include oil and grease, total suspended solids, Ocean Plan Table B metals for protection of marine life, Ocean Plan PAHs, pyrethroids, OP pesticides, ammonia, nitrate, phosphates, and critical life stage chronic toxicity for three species. In addition, within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination shall be analyzed.

3. Waterfront and Marine Operations: In addition to the above requirements for ocean receiving water monitoring, additional monitoring must be performed for marinas and boat launch and pier facilities:

a. For all marina or mooring field operators, in mooring fields with 10 or more occupied moorings, the ocean receiving water must be sampled for Ocean Plan indicator bacteria, residual chlorine, copper, zinc, grease and oil, methylene blue active substances (MBAS), and ammonia nitrogen.

   (1) For mooring field operators opting for an individual monitoring program (Section IV.B.1 above), this sampling must occur weekly (on the weekend) from May through October.

   (2) For mooring field operators opting to participate in a regional integrated monitoring program (Section IV.B.2 above), this sampling must occur monthly from May through October on a high use weekend in each month. The Water Boards may allow a reduction in the frequency of sampling, through the regional monitoring program, after the first year of monitoring.

b. For all mooring field operators, the subtidal sediment (sand or finer, if present) within mooring fields and below piers shall be sampled and analyzed for Ocean Plan Table B metals (for marine aquatic life beneficial use), acute toxicity, PAHs, and tributyltin. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed. This sampling shall occur at least three times during a five (5) year period. For mooring field operators opting to participate in a regional integrated monitoring program, the Water Boards may allow a reduction in the frequency of sampling after the first sampling effort's results are assessed.

STANDARD PERMIT PROVISIONS AND GENERAL PROVISIONS

1. Standard Permit Provisions

Code of Federal Regulations Title 40 Section 122.41 (40 CFR 122.41) includes conditions, or provisions, that apply to all National Pollutant Discharge Elimination System (NPDES) permits. Additional provisions applicable to NPDES permits are in 40 CFR 122.42. All applicable provisions in 40 CFR 122.41 and 40 CFR 122.42 must be incorporated into this Order and NPDES permit. The applicable 40 CFR 122.41 and 40 CFR 122.42 provisions are as follows:

a. DUTY TO COMPLY [40 CFR 122.41(a)]

The Copermittee must comply with all of the provisions of this permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.

(1) The Copermittee must comply with effluent standards or effective prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or effective prohibitions or standards for sewage sludge use or disposal, even if the permit has not yet been modified to incorporate the requirement. [40 CFR 122.41(a)(1)]

(2) The CWA provides that any person who violates Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any such sections in a permit issued under Section 402, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to a civil penalty not to exceed $25,000 per day for each violation. The CWA provides that any person who *negligently* violates Section 301, 302, 306, 307, 308, 318, or 405 of the CWA, or any condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, or any requirement imposed in a pretreatment program approved under Section 402(a)(3) or 402(b)(8) of the CWA, is subject to criminal penalties of $2,500 to $25,000 per day of violation, or imprisonment of not more than 1 year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than $50,000 per day of violation, or by imprisonment of not more than 2 years, or both. Any person who *knowingly* violates such sections, or such conditions or limitations is subject to criminal penalties of $5,000 to $50,000 per day of violation, or imprisonment for not more than 3 years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than $100,000 per day of violation, or imprisonment of not more than 6 years, or both. Any person who knowingly violates Section 301, 302, 303, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under Section 402 of the CWA, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of

not more than $250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than $500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in Section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than $1,000,000 and can be fined up to $2,000,000 for second or subsequent convictions.
[40 CFR 122.41(a)(2)]

(3) Any person may be assessed an administrative penalty by the San Diego Regional Water Quality Control Board (San Diego Water Board), State Water Resources Control Board (State Water Board), or United States Environmental Protection Agency (USEPA) for violating Section 301, 302, 306, 307, 308, 318 or 405 of the CWA, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed $10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed $25,000. Penalties for Class II violations are not to exceed $10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed $125,000.
[40 CFR 122.41(a)(3)]

b. DUTY TO REAPPLY [40 CFR 122.41(b)]

If a Copermittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the Copermittee must apply for and obtain a new permit.

c. NEED TO HALT OR REDUCE ACTIVITY NOT A DEFENSE [40 CFR 122.41(c)]

It shall not be a defense for a Copermittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

d. DUTY TO MITIGATE [40 CFR 122.41(d)]

The Copermittee must take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this permit that has a reasonable likelihood of adversely affecting human health or the environment.

e. PROPER OPERATION AND MAINTENANCE [40 CFR 122.41(e)]

The Copermittee must at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Copermittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems that are installed by a Copermittee only when the operation is necessary to achieve compliance with the conditions of this permit.

f. PERMIT ACTIONS [40 CFR 122.41(f)]

This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Copermittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

g. PROPERTY RIGHTS [40 CFR 122.41(g)]

This permit does not convey any property rights of any sort, or any exclusive privilege.

h. DUTY TO PROVIDE INFORMATION [40 CFR 122.41(h)]

The Copermittee must furnish to the San Diego Water Board, State Water Board, or USEPA within a reasonable time, any information which the San Diego Water Board, State Water Board, or USPEA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The Copermittee must also furnish to the San Diego Water Board, State Water Board, or USPEA upon request, copies of records required to be kept by this permit.

i. INSPECTION AND ENTRY [40 CFR 122.41(i)]

The Copermittee must allow the San Diego Water Board, State Water Board, USEPA, and/or their authorized representative (including an authorized contractor acting as their representative), upon presentation of credentials and other documents as may be required by law, to:

(1) Enter upon the Copermittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit; [40 CFR 122.41(i)(1)]

(2) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit; [40 CFR 122.41(i)(2)]

(3) Inspect and photograph at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; [40 CFR 122.41(i)(3)] and

(4) Sample or monitor at reasonable times, for the purpose of assuring permit compliance or as otherwise authorized by the CWA, any substances or parameters at any location. [40 CFR 122.41(i)(4)]

j. MONITORING AND RECORDS [40 CFR 122.41(j)]

(1) Samples and measurements taken for the purpose of monitoring must be representative of the monitored activity. [40 CFR 122.41(j)(1)]

(2) Except for records of monitoring information required by this permit related to the Copermittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five (5) years (or longer as required by 40 CFR Part 503), the

Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time. [40 CFR 122.41(j)(2)]

(3) Records for monitoring information must include: [40 CFR 122.41(j)(3)]

(a) The date, exact place, and time of sampling or measurements; [40 CFR 122.41(j)(3)(i)]
(b) The individual(s) who performed the sampling or measurements; [40 CFR 122.41(j)(3)(ii)]
(c) The date(s) analyses were performed; [40 CFR 122.41(j)(3)(iii)]
(d) The individual(s) who performed the analyses; [40 CFR 122.41(j)(3)(iv)]
(e) The analytical techniques or methods used; [40 CFR 122.41(j)(3)(v)] and
(f) The results of such analyses. [40 CFR 122.41(j)(3)(vi)]

(4) Monitoring must be conducted according to test procedures under 40 CFR Part 136 unless another method is required under 40 CFR Subchapters N or O. [40 CFR 122.41(j)(4)]

In the case of pollutants for which there are no approved methods under 40 CFR Part 136 or otherwise required under 40 CFR Subchapters N and O, monitoring must be conducted according to a test procedure specified in the permit for such pollutants. [40 CFR 122.44(i)(1)(iv)]

(5) The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or both. [40 CFR 122.41(j)(5)]

k. SIGNATORY REQUIREMENT [40 CFR 122.41(k)]

(1) All applications, reports, or information submitted to the San Diego Water Board, State Water Board, or USEPA must be signed and certified. (See 40 CFR 122.22) [40 CFR 122.41(k)(1)]

(a) *For a municipality, State, Federal, or other public agency.* [All applications must be signed] [b]y either a principal executive officer or ranking elected official. [40 CFR 122.22(a)(3)]

(b) All reports required by permits, and other information requested by the San Diego Water Board, State Water Board, or USEPA must be signed by a person described in paragraph (a) of this section, or by a duly authorized representative of that person. A person is a duly authorized representative only if: [40 CFR 122.22(b)]

(i) The authorization is made in writing by a person described in paragraph (a) of this section; [40 CFR 122.22(b)(1)]

(ii) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company, (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) [40 CFR 122.22(b)(2)] and,

(iii) The written authorization is submitted to the San Diego Water Board and State Water Board. [40 CFR 122.22(b)(3)]

(c) *Changes to authorization.* If an authorization under paragraph (b) of this section is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (b) of this section must be submitted to the San Diego Water Board prior to or together with any reports, information, or applications to be signed by an authorized representative. [40 CFR 122.22(c)]

(d) *Certification.* Any person signing a document under paragraph (a) or (b) of this section shall make the following certification:

> "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations." [40 CFR 122.22(d)]

(2) The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than 6 months per violation, or by both. [40 CFR 122.41(k)(2)]

I. REPORTING REQUIREMENTS [40 CFR 122.41(l)]

(1) *Planned changes.* The Copermittee must give notice to the San Diego Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required only when: [40 CFR 122.41(l)(1)]

(a) The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR 122.29(b); [40 CFR 122.41(l)(1)(i)] or

(b) The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which

are subject neither to effluent limitations in the permit, nor to notification requirements under 40 CFR 122.42(a)(1).
[40 CFR 122.41(l)(1)(ii)]

(c) The alteration or addition results in a significant change in the Copermittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. [40 CFR 122.41(l)(1)(iii)]

(2) *Anticipated noncompliance*. The Copermittee must give advance notice to the San Diego Water Board or State Water Board of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.
[40 CFR 122.41(l)(2)]

(3) *Transfers*. This permit is not transferable to any person except after notice to the San Diego Water Board. The San Diego Water Board may require modification or revocation and reissuance of the permit to change the name of the Copermittee and incorporate such other requirements as may be necessary under the CWA.
[40 CFR 122.41(l)(3)]

(4) *Monitoring reports.* Monitoring results must be reported at the intervals specified elsewhere in this permit. [40 CFR 122.41(l)(4)]

(a) Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the San Diego Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. [40 CFR 122.41(l)(4)(i)]

(b) If the Copermittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR Part 136 or another method required for an industry-specific waste stream under 40 CFR Subchapters N or O, the results of this monitoring must be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the San Diego Water Board or State Water Board.
[40 CFR 122.41(l)(4)(ii)]

(c) Calculations for all limitations which require averaging of measurements must utilize an arithmetic mean unless otherwise specified in the permit.
[40 CFR 122.41(l)(4)(iii)]

(5) *Compliance schedules*. Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit must be submitted no later than 14 days following each schedule date. [40 CFR 122.41(l)(5)]

(6) *Twenty-four hour reporting.*

(a) The Copermittee must report any noncompliance that may endanger health or the environment. Any information must be provided orally within 24 hours from the time the Copermittee becomes aware of the circumstances. A written submission must also be provided within five (5) days of the time the Copermittee becomes aware of the circumstances. The written submission must contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. [40 CFR 122.41(l)(6)(i)]

(b) The following must be included as information which must be reported within 24 hours under this paragraph: [40 CFR 122.41(l)(6)(ii)]

(i) Any unanticipated bypass that exceeds any effluent limitation in the permit (See 40 CFR 122.41(g)). [40 CFR 122.41(l)(6)(ii)(A)]
(ii) Any upset which exceeds any effluent limitation in the permit. [40 CFR 122.41(l)(6)(ii)(B)] and,
(iii) Violation of a maximum daily discharge limitation for any of the pollutants listed by the San Diego Water Board in the permit to be reported within 24 hours. (See 40 CFR 122.44(g)) [40 CFR 122.41(l)(6)(ii)(C)]

(c) The San Diego Water Board may waive the above-required written report on a case-by-case basis if the oral report has been received within 24 hours. [40 CFR 122.41(l)(6)(iii)]

(7) *Other noncompliance.* The Copermittee must report all instances of noncompliance not reported in accordance with the standard provisions required under 40 CFR 122.41(l)(4), (5), and (6), at the time monitoring reports are submitted. The reports must contain the information listed in the standard provisions required under 40 CFR 122.41(l)(6). [40 CFR 122.41(l)(7))]

(8) *Other information.* When the Copermittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the San Diego Water Board, State Water Board, or USEPA, the Copermittee must promptly submit such facts or information. [40 CFR 122.41(l)(8)]

~~**m. BYPASS** [40 CFR 122.41(m)]~~

~~(1) *Definitions.*~~

~~(a) "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. [40 CFR 122.41(m)(1)(i)] or~~

~~(b) "Severe property damage" means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be~~

Comment [A126]: While this is a standard condition for NPDES permits, it is manifestly inapplicable to MS4 permits. Since BMPs constructed to comply with the Order include bypass provisions to protect their entirety, the Copermittees would have to notify the Regional Board whenever a storm was predicted. This provision should be deleted.

~~expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.~~
~~[40 CFR 122.41(m)(1)(ii)]~~

~~(2) *Bypass not exceeding limitations*. The Copermittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the standard provisions required under 40 CFR 122.41(m)(3) and (4).~~
~~[40 CFR 122.41(m)(2)]~~

~~(3) *Notice.*~~

~~(a) *Anticipated bypass*. If the Copermittee knows in advance of the need for a bypass, it must submit a notice, if possible at least ten days before the date of the bypass. [40 CFR 122.41(m)(3)(i)] or~~

~~(b) *Unanticipated bypass*. The Copermittee must submit notice of an unanticipated bypass in accordance with the standard provisions required under 40 CFR 122.41(l)(6) (24-hour notice).~~
~~[40 CFR 122.41(m)(3)(ii)]~~

~~(4) *Prohibition of Bypass.*~~

~~(a) Bypass is prohibited, and the San Diego Water Board may take enforcement action against a Copermittee for bypass, unless:~~
~~[40 CFR 122.41(m)(4)(i)]~~

~~(i) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage; [40 CFR 122.41(m)(4)(i)(A)]~~
~~(ii) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance;~~
~~[40 CFR 122.41(m)(4)(i)(B)] and,~~
~~(iii) The Copermittee submitted notice in accordance with the standard provisions required under 40 CFR 122.41(m)(3).~~
~~[40 CFR 122.41(m)(4)(i)(C)]~~

~~(b) The San Diego Water Board may approve an anticipated bypass, after considering its adverse effects, if the San Diego Water Board determines that it will meet the three conditions listed above.~~
~~[40 CFR 122.41(m)(4)(ii)]~~

~~n.~~m. **UPSET** [40 CFR 122.41(n)]

(1) *Definition.* "Upset" means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Copermittee. An upset does not

include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. [40 CFR 122.41(n)(1)]

(2) *Effect of an upset*. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the standard provisions required under 40 CFR 122.41(n)(3) are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. [40 CFR 122.41(n)(2)]

(3) *Conditions necessary for a demonstration of upset*. A Copermittee who wishes to establish the affirmative defense of upset must demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that: [40 CFR 122.41(n)(3)]

(a) An upset occurred and that the Copermittee can identify the cause(s) of the upset; [40 CFR 122.41(n)(3)(i)]
(b) The permitted facility was at the time being properly operated; [40 CFR 122.41(n)(3)(ii)] and
(c) The Copermittee submitted notice of the upset in accordance with the standard provisions required under 40 CFR 122.41(l)(6)(ii)(B) (24-hour notice). [40 CFR 122.41(n)(3)(iii)]
(d) The Copermittee complied with any remedial measures pursuant to the standard provisions required under 40 CFR 122.41(d). [40 CFR 122.41(n)(3)(iii)]

(4) *Burden of proof*. In any enforcement proceeding, the Copermittee seeking to establish the occurrence of an upset has the burden of proof. [40 CFR 122.41(n)(4)]

~~o.~~n. STANDARD PERMIT PROVISIONS FOR MUNICIPAL SEPARATE STORM SEWER SYSTEMS
[40 CFR 122.42(c)]

The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the San Diego Water Board or State Water Board under 40 CFR 122.26(a)(1)(v) must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report must include:

(1) The status of implementing the components of the storm water management program that are established as permit conditions; [40 CFR 122.42(c)(1)]

(2) Proposed changes to the storm water management programs that are established as permit conditions. Such proposed changes must be consistent with 40 CFR 122.26(d)(2)(iii); [40 CFR 122.42(c)(2)] and

(3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under 40 CFR 122.26(d)(2)(iv) and (v); [40 CFR 122.42(c)(3)]

(4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; [40 CFR 122.42(c)(4)]

(5) Annual expenditures and budget for year following each annual report; [40 CFR 122.42(c)(5)]

(6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; [40 CFR 122.42(c)(6)]

(7) Identification of water quality improvements or degradation. [40 CFR 122.42(c)(7)]

~~p.~~o. **STANDARD PERMIT PROVISIONS FOR STORM WATER DISCHARGES** [40 CFR 122.42(d)]

The initial permits for discharges composed entirely of storm water issued pursuant to 40 CFR 122.26(e)(7) must require compliance with the conditions of the permit as expeditiously as practicable, but in no event later than three years after the date of issuance of the permit.

2. General Provisions

In addition to the standard provisions required to be incorporated into the Order and NPDES permit pursuant to 40 CFR 122.41 and 40 CFR 122.42, several other general provisions apply to this Order. The general provisions applicable to this Order and NPDES permit are as follows:

a. DISCHARGE OF WASTE IS A PRIVILEGE

No discharge of waste into the waters of the State, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the State are privileges, not rights. [CWC Section 13263(g)]

b. DURATION OF ORDER AND NPDES PERMIT

(1) *Effective date*. This Order and NPDES permit becomes effective on the 50th day after its adoption provided the USEPA has no objection. If the USEPA objects to its issuance, this Order shall not become effective until such objection is withdrawn. This Order supersedes Order No. R9-2007-0001 upon the effective date of this Order, and supersedes Order Nos. R9-2009-0002 and R9-2010-0016 upon their expiration or earlier notice of coverage.

(2) *Expiration*. This Order and NPDES permit expires five years after its effective date. [40 CFR 122.46(a)]

(3) *Continuation of expired order*. After this Order and NPDES permit expires, the terms and conditions of this Order and NPDES permit are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on the continuation of expired permits (40 CFR 122.6) are complied with.

c. AVAILABILITY

A copy of this Order must be kept at a readily accessible location and must be available to on-site personnel at all times.

d. CONFIDENTIALITY OF INFORMATION

Except as provided for in 40 CFR 122.7, no information or documents submitted in accordance with or in application for this Order will be considered confidential, and all such information and documents shall be available for review by the public at the San Diego Water Board office.

Claims of confidentiality for the following information will be denied:
[40 CFR 122.7(b)]

(1) The name and address of any permit applicant or Copermittee;
[40 CFR 122.7(b)(1)] and

(2) Permit applications and attachments, permits, and effluent data.
[40 CFR 122.7(b)(2)]

e. EFFLUENT LIMITATIONS

(1) *Interim effluent limitations*. The Copermittee must comply with any interim effluent limitations as established by addendum, enforcement action, or revised waste discharge requirements which have been, or may be, adopted by the San Diego Water Board.

(2) *Other effluent limitations and standards*. If any applicable toxic effluent standard or effective prohibition (including any schedule of compliance specified in such effluent standard or effective prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant and that standard or effective prohibition is more stringent than any limitation on the pollutant in the permit, the San Diego Water Board shall institute proceedings under these regulations to modify or revoke and reissue the permit to conform to the toxic effluent standard or effective prohibition. [40 CFR 122.44(b)(1~~)])]~~)].~~)]~~

f. DUTY TO MINIMIZE OR CORRECT ADVERSE IMPACTS

The Copermittee must take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncompliance.

g. PERMIT ACTIONS

The filing of a request by the Copermittee for modification, revocation and reissuance, or termination of this Order, or a notification of planned change in or anticipated noncompliance with this Order does not stay any condition of this Order. (See 40 CFR 122.41(f)) In addition, the following provisions apply to this Order:

(1) Upon application by any affected person, or on its own motion, the San Diego Water Board may review and revise the requirements in this Order. All requirements must be reviewed periodically. [CWC Section 13263(e)]

(2) This Order may be terminated or modified for cause, including, but not limited to, all of the following: [CWC Section 13381]

   (a) Violation of any condition contained in the requirements of this Order. [CWC Section 13381(a)]

   (b) Obtaining the requirements in this Order by misrepresentation, or failure to disclose fully all relevant facts. [CWC Section 13381(b)]

   (c) A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge. [CWC Section 13381(c)]

(3) When this Order is transferred to a new owner or operator, such requirements as may be necessary under the CWC may be incorporated into this Order.

h. NPDES PERMITTED NON-STORM WATER DISCHARGES

The San Diego Water Board has, in prior years, issued a limited number of individual NPDES permits for non-storm water discharges to MS4s. The San Diego Water Board or State Water Board may in the future, upon prior notice to the Copermittee(s), issue an NPDES permit for any non-storm water discharge (or class of non-storm water discharges) to an MS4. A Copermittee will not be held responsible for pollutants in its MS4 discharge originating from an NPDES-permitted non-storm water discharge.

Comment [A127]: This comment reflects the appropriate responsibility between NPDES dischargers.

i. MONITORING

In addition to the standard provisions required under 40 CFR 122.41(j) and (l)(4), the following general monitoring provisions apply to this Order:

(1) Where procedures are not otherwise specified in Order, sampling, analysis and quality assurance/quality control must be conducted in accordance with the Quality Assurance Management Plan (QAMP) for the State of California's Surface Water Ambient Monitoring Program (SWAMP), adopted by the State Water Resources Control Board (State Water Board).

(2) Pursuant to 40 CFR 122.41(j)(2) and CWC Section 13383(a), each Copermittee must retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least five (5) years from the date of the sample, measurement, report or application. This period may be extended by request of the San Diego Water Board at any time.

Comment [A128]: This provision and the provision in Attachment B 1.j(2) conflict. The Water Board should reconcile these provisions or delete one.

(3) All chemical, bacteriological, and toxicity analyses must be conducted at a laboratory certified for such analyses by the California Department of Public Health or a laboratory approved by the San Diego Water Board.

(4) For priority toxic pollutants that are identified in the California Toxics Rule (CTR) (65 Fed. Reg. 31682), the Copermittees must instruct their laboratories to establish calibration standards that are equivalent to or lower than the Minimum Levels (MLs) published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). If a Copermittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR Part 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Copermittee must submit documentation from the laboratory to the San Diego Water Board for approval prior to raising the ML for any priority toxic pollutant.

j. ENFORCEMENT

(1) The San Diego Water Board is authorized to enforce the terms of this Order under several provisions of the CWC, including, but not limited to, CWC Sections 13385, 13386, and 13387.

(2) Nothing in this Order shall be construed to protect the Copermittee from its liabilities under federal, state, or local laws.

(3) The CWC provides for civil and criminal penalties comparable to, and in some cases greater than, those provided for under the CWA.

(4) Except as provided in the standard conditions required under 40 CFR 122.41(m) and (n), nothing in this Order shall be construed to relieve the Copermittee from civil or criminal penalties for noncompliance.

(5) Nothing in this Order shall be construed to preclude the institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties to which the Copermittee is or may be subject to under Section 311 of the CWA.

(6) Nothing in this Order shall be construed to preclude institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties established pursuant to any applicable state law or regulation under authoring preserved by Section 510 of the CWA.

k. SEVERABILITY

The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this Order shall not be affected thereby.

l. APPLICATIONS

Any application submitted by a Copermittee for reissuance or modification of this Order must satisfy all applicable requirements specified in federal regulations as well as any additional requirements for submittal of a Report of Waste Discharge specified in the CWC and the California Code of Regulations.

m. IMPLEMENTATION

All plans, reports and subsequent amendments submitted in compliance with this Order must be implemented immediately (or as otherwise specified). All submittals by Copermittees must be adequate to implement the requirements of this Order.

n. REPORT SUBMITTALS

(1) All report submittals must include an executive summary, introduction, conclusion, recommendations, and signed certified statement.

(2) Each Copermittee must submit a signed certified statement covering its responsibilities for each applicable submittal.

(3) The Principal Watershed Copermittee(s) must submit a signed certified statement covering its responsibilities for each applicable submittal and the sections of the submittals for which it is responsible.

(4) Unless otherwise directed, the Copermittees must submit one hard copy and one electronic copy of each report required under this Order to the San Diego Water Board, and one electronic copy to the USEPA.

(5) The Copermittees must submit reports and provide notifications as required by this Order to the following:

DEFINITIONS

Active/Passive Sediment Treatment - Using mechanical, electrical or chemical means to flocculate or coagulate suspended sediment for removal from runoff from construction sites prior to discharge.

Anthropogenic Litter – Trash generated from human activities, not including sediment.

Automotive Repair Shop – a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539 or equivalent NAICS code.

Average Monthly Action Level – The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month, or the geometric mean for bacteria, as applicable.

Beneficial Uses - The uses of water necessary for the survival or wellbeing of man, plants, and wildlife. These uses of water serve to promote tangible and intangible economic, social, and environmental goals. "Beneficial Uses" ~~of the waters of the State~~ that may be protected include, but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. Existing beneficial uses are uses that were attained in the surface or ground water on or after November 28, 1975; and potential beneficial uses are uses that would probably develop in future years through the implementation of various control measures. "Beneficial Uses" are equivalent to "Designated Uses" under federal law. [California Water Code Section 13050(f)].

Best Management Practices (BMPs) - Defined in 40 CFR 122.2 as schedules of activities, effective prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. In the case of municipal discharge permits, BMPs may be used in the place of numeric effluent limits.

Bioassessment - The use of biological community information to evaluate the biological integrity of a water body and its watershed. With respect to aquatic ecosystems, bioassessment is the collection and analysis of samples of the benthic macroinvertebrate community together with physical/habitat quality measurements associated with the sampling site and the watershed to evaluate the biological condition (i.e. biotic integrity) of a water body.

Biofiltration - Practices that use vegetation and amended soils to detain and treat runoff from impervious areas. Treatment is through filtration, infiltration, adsorption, ion exchange, and biological uptake of pollutants.

Biological Integrity - Defined in Karr J.R. and D.R. Dudley. 1981. Ecological perspective on water quality goals. *Environmental Management* 5:55-68 as: "A balanced, integrated, adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of natural habitat of the region." Also referred to as ecosystem health.

BMP Design Manual – A plan developed to eliminate, reduce, or mitigate the impacts of runoff from development projects, including Priority Development Projects.

Channel Rehabilitation and Improvement – Remedial measures or activities for the purpose of improving or restoring the environmental health of streams, channels or river systems. Techniques may vary from in-stream restoration techniques to off-line stormwater management practices installed in the system corridor or upland areas. Rehabilitation techniques may include, but are not limited to the following: riparian zone restoration, constructed wetlands, bank stabilization, channel modifications, and day lighting of drainage systems.

Comment [A129]: This term should be defined in Attachment C given its use in the Order.

Clean Water Act Section 303(d) Water Body - An impaired water body in which water quality does not meet applicable water quality standards and/or is not expected to meet water quality standards, even after the application of technology based pollution controls required by the CWA. The discharge of runoff to these water bodies by the Copermittees is significant because these discharges can cause or contribute to violations of applicable water quality standards.

Construction Site – Any project, including projects requiring coverage under the Construction General Permit, that involves soil disturbing activities greater than 10,000 square feet including, but not limited to, clearing, grading, disturbances to ground such as stockpiling, and excavation. This does not include interior construction activities such as interior remodeling, plumbing, electrical, or mechanical work.

Contamination - As defined in the Porter-Cologne Water Quality Control Act, contamination is "an impairment of the quality of waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease. 'Contamination' includes any equivalent effect resulting from the disposal of waste whether or not waters of the State are affected."

Copermittee – An incorporated city within the County of Orange, County of Riverside, or County of San Diego in the San Diego Region~~,~~ (Region 9), ~~,~~ the County of Orange, the County of Riverside, the County of San Diego, the Orange County Flood Control District, the Riverside County Water Conservation and Flood Control District, the San Diego Regional Airport Authority, or the San Diego Unified Port District. See also "Municipal Copermittee" and "Special District Copermittee".

Comment [A130]: As set forth above, the Riverside County Copermittees make a distinction in these classes of Copermittees based on their respective legal authorities.

Copermittees – All of the individual Copermittees, collectively, unless the obligation in question is directed to one or a sub-group of Copermittees.

Comment [A131]: This clarifies that not all obligations in the Order directed to "Copermittees" are in fact applicable to all Copermittees.

Critical Channel Flow (Qc) – The channel flow that produces the critical shear stress that initiates bed movement or that erodes the toe of channel banks. When measuring Qc, it should be based on the weakest boundary material – either bed or bank.

Daily Discharge – Defined as either: (1) the total mass of the constituent discharged over the calendar day or any 24 hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g. concentration.)

The Daily Discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day, or other 24 hour period other than a day), or by the arithmetic mean of analytical results from one or more grab samples taken over the course of a day.

Development Projects - Construction, rehabilitation, redevelopment, or reconstruction of any public or private residential project, industrial~~,~~ or commercial facility, or any other projects designed for post-construction human activity or occupation and involving land disturbance activities.

Direct Discharge to an Environmentally Sensitive Area – refers to outflow from a drainage conveyance system that collects runoff from the subject development or redevelopment site and terminates at or in receiving waters within the ESA, and is not commingled with flows from adjacent or other upstream lands.

Dry Season –May 1 to September 30.

Dry Weather – Weather is considered dry if the preceding 72 hours has been without measurable precipitation (>0.1 inch).

Enclosed Bays – Enclosed bays are indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost bay works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays do not include inland surface waters or ocean waters.

Erosion – When land is diminished or worn away due to wind, water, or glacial ice. Often the eroded debris (silt or sediment) becomes a pollutant via storm water runoff. Erosion occurs naturally but can be intensified by land clearing activities such as farming, development, road building, and timber harvesting. This permit is concerned particularly with non-naturally occurring Erosion that eventually results in a Sediment discharge from MS4s into Receiving Waters.

Environmentally Sensitive Areas (ESAs) - Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Board and San Diego Water Board; State Water Quality Protected Areas; water bodies designated with the RARE beneficial use by the State Water Board and San Diego Water Board; areas designated as preserves or their equivalent under the Natural Communities Conservation Program within the Cities and County of Orange; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees.

Estuaries – Waters, including coastal lagoons, located at the mouth of streams that serve as areas of mixing fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and ocean water. Estuaries do not include inland surface waters or ocean waters.

Existing Development – Any area that has been developed and exists for municipal, commercial, industrial, or residential purposes, uses, or activities. May include areas that are not actively used for its originally developed purpose, but may be re-purposed or redeveloped

Comment [A132]: This definition clarifies the nature of Development Projects covered under the Order.

for another use or activity.

Flow Duration – The long-term period of time that flows occur above a threshold that causes significant sediment transport and may cause excessive erosion damage to creeks and streams (not a single storm event duration). The simplest way to visualize this is to consider a histogram of pre- and post-project flows using long-term records of hourly data. To maintain pre-development flow duration means that the total number of hours (counts) within each range of flows in a flow-duration histogram cannot increase between the pre- and post-development condition. Flow duration within the range of geomorphologically significant flows is important for managing erosion.

Grading - The cutting and/or filling of the land surface to a desired slope or elevation.

Hazardous Material – Any substance that poses a threat to human health or the environment due to its toxicity, corrosiveness, ignitability, explosive nature or chemical reactivity. These also include materials named by the USEPA in 40 CFR 116 to be reported if a designated quantity of the material is spilled into the waters of the U.S. or emitted into the environment.

Hazardous Waste - Hazardous waste is defined as "any waste which, under Section 600 of Title 22 of this code, is required to be managed according to Chapter 30 of Division 4.5 of Title 22 of this code" [CCR Title 22, Division 4.5, Chapter 11, Article 1].

Household Hazardous Waste – Paints, cleaning products, and other hazardous wastes generated during home improvement or maintenance activities.

Hydromodification – The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, such as stream channelization, concrete lining, installation of dams and water impoundments, and excessive streambank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Illicit Connection – Any connection to the MS4 that conveys an illicit discharge.

Illicit Discharge - Any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities [40 CFR 122.26(b)(2)]. Discharges from natural sources or from conditionally exempt sources described in this Order are not considered Illicit Discharges.

Inactive Areas – Areas of construction activity that are not active and those that have been active and are not scheduled to be re-disturbed for at least 14 days.

Infiltration – Water other than wastewater that enters a sewer system (including sewer service connections and foundation drains) from the ground through such means as defective pipes, pipe joints, connections, or manholes. Infiltration does not include, and is distinguished from, inflow [40 CFR 35.2005(20)].

Comment [A133]: Wrong definition. Should be defining infiltration (of stormwater into soil)

Inland Surface Waters – Includes all surface waters of the U.S.~~State~~ that do not include the ocean, enclosed bays, or estuaries.

Jurisdictional Runoff Management Program Document – A written description of the specific jurisdictional runoff management measures and programs that each Copermittee will implement to comply with this Order and ensure that illicit discharges are effectively prohibited, and storm water pollutant discharges in runoff are reduced to the MEP and do not cause or contribute to a violation of water quality standards.

Low Impact Development (LID) – A storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

Low Impact Development Best Management Practices (LID BMPs) – LID BMPs include schedules of activities, effective prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States through storm water management and land development strategies that emphasize conservation ~~s~~and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions. LID BMPs include retention practices that do not allow runoff, such as infiltration, rain water harvesting and reuse, and evapotranspiration. LID BMPs also include flow-through practices such as biofiltration that may have some discharge of storm water following pollutant reduction.

Major Outfall – As defined in the Code of Federal Regulations, a major outfall is a MS4 outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (i.e. discharge from a single conveyance other than a circular pipe which is associated with a drainage area of more than 50 acres); or, for MS4s that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or equivalent), a MS4 outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (i.e. discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

Maximum Daily Action Level (MDAL) –The highest allowable daily discharge of a pollutant, over a calendar day (or 24 hour period). For pollutants with action levels expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with action levels expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Maximum Extent Practicable (MEP) – The technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) ~~for storm water~~ that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve, typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense). MEP considers economics and is generally, but not necessarily, less stringent than BAT. A definition for MEP is not provided either in the statute or in the regulations. Instead the definition of MEP is dynamic and will be defined by the following process over time: municipalities propose their definition of MEP by way of their runoff management programs. Their total collective and individual activities conducted pursuant to the runoff management programs becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance). In the absence of a proposal acceptable to the San Diego Water Board, the San Diego Water Board defines MEP.

In a memo dated February 11, 1993, entitled "Definition of Maximum Extent Practicable," Elizabeth Jennings, Senior Staff Counsel, SWRCB addressed the achievement of the MEP standard as follows:

"*To achieve the MEP standard, municipalities must employ whatever Best Management Practices (BMPs) are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:*

a. Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?
b. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
c. Public Acceptance: Does the BMP have public support?
d. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?
e. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc.?

The final determination regarding whether a municipality has reduced pollutants to the maximum extent practicable can only be made by the Regional or State Water Boards, and not by the municipal discharger. If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit derived, it would have met the standard. Where a choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP based solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be lightly rejected. In any case, the burden would be on the municipal discharger to show compliance with its permit. After selecting a menu of BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented."

Monitoring Year – October 1 to September 30

Municipal Copermittee – Any Copermittee, exclusive of Special District Copermittees.

Comment [A134]: This definition clarifies distinction between municipal and special district copermittees.

Municipal Separate Storm Sewer System (MS4) – A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) Designated or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; (iv) Which is not part of the Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2~~6~~. Copermittees need only comply with permit conditions relating to "discharges from the municipal separate storm sewers for which they are operators." 40 CFR 122.26(a)(vi).

Comment [A135]: These changes correct a citation and clarifies the responsibility of the copermittees as to other MS4s.

National Pollutant Discharge Elimination System (NPDES) - The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Sections 307, 318, 402, and 405 of the CWA.

Non-Storm Water - All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). ~~Non-storm water includes illicit discharges and NPDES permitted discharges.~~

Comment [A136]: This is overly limiting, There are other types of Non-storm discharges that do not fit these two categories (e.g. irrigated agriculture, natural flows, conditionally exempt flows, others). Rather than trying to identify all types of non-stormwater discharges, suggest just deleting this sentence.

Nuisance - As defined in the Porter-Cologne Water Quality Control Act, a nuisance is "anything which meets all of the following requirements: 1) Is injurious to health, or is indecent, or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. 2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. 3) Occurs during, or as a result of, the treatment or disposal of wastes."

Ocean Waters – the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Board's California Ocean Plan.

Order – Unless otherwise specified, refers to this Order, Order No. R9-2013-0001 (NPDES No. CAS0109266)

Outfall – *Outfall* means a *point source* as defined by 40 CFR 122.2 at the point where a MS4 discharges to waters of the United States and does not include open conveyances connecting two MS4s, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United. 40 CFR 122.26(b)(9).

Comment [A137]: This federal regulatory definition clarifies the nature of an outfall.

Parking Lot – a land area or facility for the tempraory parking or storage of motor vehicles used personally, for business, or for commerce.

Comment [A138]: Definition placed in Attachment C for consistency.

Persistent Flow - Persistent flow is defined as the presence of an MS4 discharge that is hydraulically connected to a flowing~~, pooled, or ponded~~ receiving water more than 72 hours after a measureable rainfall event of 0.1 inch or greater during three consecutive monitoring and/or inspection events. All other flowing, pooled, or ponded water is considered transient.

Comment [A139]: Changes reflect the necessity of a connection to flowing receiving waters. Discharges that are pooled are not discharges to waters of the United States. Please see Comment Letter section 3.5.3.

Person - A person is defined as an individual, association, partnership, corporation, municipality, State or Federal agency, or an agent or employee thereof [40 CFR 122.2].

Point Source - Any discernible, confined, and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operations, landfill leachate collection systems, vessel, or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Pollutant - Any agent that may cause or contribute to the degradation of water quality such that a condition of pollution or contamination is created or aggravated.

Pollution - As defined in the Porter-Cologne Water Quality Control Act, pollution is "the alteration of the quality of the waters of the State by waste, to a degree that unreasonably affects the either of the following: 1) The waters for beneficial uses; or 2) Facilities that serve these beneficial uses." Pollution may include contamination.

Pollution Prevention - Pollution prevention is defined as practices and processes that reduce or eliminate the generation of pollutants, in contrast to source control BMPs, treatment control BMPs, or disposal.

Pre-Project~~Development~~ Runoff Conditions – Runoff conditions that exist~~existed~~ onsite immediately before the ~~existing development was constructed, or exists onsite before~~ planned development activities occur. Pre-development is not intended to be interpreted as that period before any human-induced land disturbance has occurred. 64 FR 68761.

Comment [A140]: This definition reflects the exact language used by U.S. EPA in the Federal Register. Moreover, it avoids the constitutional and statutory problems with requiring developers to mitigate for impacts not attributable to their project. It also is consistent with the CEQA standard for project impact mitigation.

Priority Development Projects - New development and redevelopment projects defined under Provision E.3.b of Order No. R9-2012-0011.

Properly Designed – Designed in accordance with the Copermittee's BMP Design Manual and/or any appropriate design requirements set forth by the Copermittee and based on widely accepted design criteria and in accordance with this Order.

Comment [A141]: This definition is required to address this standard, which is mentioned in the Order but not defined.

Rainy Season (aka Wet Season) –October 1 to April 30

Receiving Waters – Waters of the United States.

Receiving Water Limitations - Waste discharge requirements issued by the San Diego Water Board typically include both: (1) "Effluent Limitations" (or "Discharge Limitations") that specify the technology-based or water-quality-based effluent limitations; and (2) "Receiving Water Limitations" that specify the water quality objectives in the Basin Plan as well as any other limitations necessary to attain those objectives. In summary, the "Receiving Water Limitations" provision is the provision used to implement the requirements of CWA section 402(p)(3)(B).

Redevelopment - The creation, addition, and or replacement of impervious surface on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; parking lots; resurfacing existing roadways; cutting and reconfiguring of surface parking lots; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair and emergency restoration and public safety projects.

Comment [A142]: The changes requested in this definition appropriately exempts de minimis or emergency/public safety projects.

Reporting Period – The period of information that is reported in the Annual Report. The reporting period consists of two components: 1) July 1 to June 30, consistent with the fiscal year, for the implementation of the jurisdictional runoff management programs, and 2) October 1 to September 30, consistent with the monitoring year for the monitoring and assessment programs. Together, these two time periods constitute the reporting year for the Annual Report due January 31 following the end of the monitoring year.

Restaurant – a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812).

Retail gasoline outlet (RGO) – a business that sells automotive or truck fuel to the general public with a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.

Retain –Keep or hold in a particular place, condition, or position without discharge to ~~surface~~ Receiving W~~w~~aters.

Retrofitting – Storm water management practices put into place after development has occurred in watersheds where the practices previously did not exist~~.~~ or are ineffective.~~.~~ Retrofitting of developed areas is intended to improve water quality, protect downstream channels, reduce flooding, or meet other specific objectives. Retrofitting developed areas may include, but is not limited to replacing roofs with green roofs, disconnecting downspouts or impervious surfaces to drain to pervious surfaces, replacing impervious surfaces with pervious surfaces, installing rain barrels, installing rain gardens, and trash area enclosures.

Runoff - All flows in a storm water conveyance system that consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water including dry weather flows.

San Diego Water Board – As used in this document the term "San Diego Water Board" is synonymous with the term "Regional Board" as defined in Water Code section 13050(b) and is intended to refer to the California Regional Water Quality Control Board for the San Diego Region as specified in Water Code Section 13200.

Sediment - Soil, sand, and minerals washed from land into water. Sediment resulting from anthropogenic sources (i.e. human induced land disturbance activities) that is discharged into Receiving Waters is considered a pollutant. This Order regulates only the discharges of sediment from anthropogenic sources into Receiving Waters and does not regulate naturally occurring sources of sediment. Sediment can destroy fish-nesting areas, clog animal habitats, and cloud waters so that sunlight does not reach aquatic plants.

Special District Copermittee – A separate legal entity that may own or operate MS4 systems, but has no land use authorities outside of their MS4. The Riverside County Flood Control and Water Conservation District [and Orange County Flood Control District?] is a [are] Special District Copermittee[s].

Source Control BMP – Land use or site planning practices, or structural or nonstructural measures that aim to prevent runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and runoff.

Storm Water – Per 40 CFR 122.26(b)(13), means storm water runoff, snowmelt runoff and surface runoff and drainage. ~~Surface runoff and drainage pertains to runoff and drainage resulting from precipitation events.~~

Comment [A143]: Relocation of definition to Attachment C.

Comment [A144]: Definition added for clarity and consistency with prior redlines

Comment [A145]: Edit clarifies intent of definition.

Stream, Channel, or Habitat Rehabilitation – Measures or activities for the purpose of improving or restoring the environmental health (i.e. physical, chemical and biological integrity) of streams, channels, or river systems. Rehabilitation techniques may include, but are not limited to, riparian zone restoration, constructed wetlands, bank stabilization, channel reconfiguration, and daylighting drainage systems.

Street, Road, Highway, Freeway – Any paved impervious surface that is used for the transportation of automobiles, trucks, motorcycles, and other vehicles, with an ADT of at least 100 vehicles per day.

Structural BMPs - A subset of BMPs which detains, retains, filters, removes, or prevents the release of pollutants to surface waters from development projects in perpetuity, after construction of a project is completed.

Total Maximum Daily Load (TMDL) - The maximum amount of a pollutant that can be discharged into a water body from all sources (point and non-point) and still maintain water quality standards. Under CWA section 303(d), TMDLs must be developed for all water bodies that do not meet water quality standards after application of technology-based controls.

Toxicity - Adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). The water quality objectives for toxicity provided in the Basin Plan, state in part…“All waters shall be free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life….The survival of aquatic life in surface waters subjected to a waste discharge or other controllable water quality factors, shall not be less than that for the same water body in areas unaffected by the waste discharge”.

Treatment Control BMP – Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

Unpaved Road – Any long, narrow stretch without pavement used for traveling by motor passenger vehicles between two or more points. Unpaved roads are generally constructed of dirt, gravel, aggregate or macadam and may be improved or unimproved.

Waste - As defined in CWC Section 13050(d), “waste includes sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal.”

Article 2 of CCR Title 23, Chapter 15 (Chapter 15) contains a waste classification system that applies to solid and semi-solid waste, which cannot be discharged directly or indirectly to water of the state and which therefore must be discharged to land for treatment, storage, or disposal in accordance with Chapter 15. There are four classifications of waste (listed in order of highest to lowest threat to water quality): hazardous waste, designated waste, non-hazardous solid waste, and inert waste.

Water Quality Objective - Numerical or narrative limits on constituents or characteristics of

Comment [A146]: Definition relocated to Attachment C.

Comment [A147]: Consistent with RGO definition.

water designated to protect designated beneficial uses of the water. [California Water Code Section 13050 (h)]. California's water quality objectives are established by the State and Regional Water Boards in the Water Quality Control Plans. Numeric or narrative limits for pollutants or characteristics of water designed to protect the beneficial uses of the water. In other words, a water quality objective is the maximum concentration of a pollutant that can exist in a receiving water and still generally ensure that the beneficial uses of the receiving water remain protected (i.e., not impaired). Since water quality objectives are designed specifically to protect the beneficial uses, when the objectives are violated the beneficial uses are, by definition, no longer protected and become impaired. This is a fundamental concept under the Porter Cologne Act. Equally fundamental is Porter Cologne's definition of pollution. A condition of pollution exists when the water quality needed to support designated beneficial uses has become unreasonably affected or impaired; in other words, when the water quality objectives have been violated. These underlying definitions (regarding beneficial use protection) are the reason why all waste discharge requirements implementing the federal NPDES regulations require compliance with water quality objectives. (Water quality objectives are also called water quality criteria in the CWA.)

Water Quality Standards - Water quality standards, as defined in Clean Water Act section 303(c) consist of the beneficial uses (e.g., swimming, fishing, municipal drinking water supply, etc.,) of a water body and criteria (referred to as water quality objectives in the California Water Code) necessary to protect those uses. Under the Water Code, the water boards establish beneficial uses and water quality objectives in water quality control or basin plans. Together with an anti-degradation policy, these beneficial uses and water quality objectives serve as water quality standards under the Clean Water Act. In Clean Water Act parlance, state beneficial uses are called "designated uses" and state water quality objectives are called "criteria." Throughout this Order, the relevant term is used depending on the statutory scheme.

Waters of the State - Any water, surface or underground, including saline waters within the boundaries of the State [CWC section 13050 (e)]. The definition of the Waters of the State is broader than that for the Waters of the United States in that all water in the State is considered to be a Waters of the State. ~~, regardless of circumstances or condition.~~

Comment [A148]: The intent of the definition is to cover natural water sources, and not anthropogenic structures that collect runoff to reduce volume/velocity or pollutants.

Waters of the United States - As defined in the 40 CFR 122.2, the Waters of the U.S. are defined as: "(a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate "wetlands;" (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition: (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial seas; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with the EPA."

Watershed - That geographical area which drains to a specified point on a water course, usually a confluence of streams or rivers (also known as drainage area, catchment, or river basin).

Wet Season (aka Rainy Season) –October 1 to April 30

Wet Weather – Weather is considered wet if there is a storm event of 0.1 inches and greater and the following 72 hours, unless otherwise defined by the Copermittee for the purposes of monitoring consistent with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), or developed pursuant to another regulatory mechanism.

Comment [A149]: This is important as the monitoring requirements require you to sample the first 'Wet Weather' event. 0.1" of rainfall doesn't result in runoff in all watersheds. Copermittees should be able to define mobilization criteria to identify storms that are likely to produce runoff in that drainage area consistent with this EPA guidance.

LEGAL AND FACT SHEET COMMENTS ON TENTATIVE ORDER R9-2013-0001 MADE ON BEHALF OF THE RIVERSIDE COUNTY COPERMITTEES

This document provides comments on various legal issues raised by Tentative Order No. R9-2013-0001 (the "Draft Permit") and associated attachments, including Attachment F, the Fact Sheet/Technical Report ("Fact Sheet"), and are made on behalf of the Riverside County Flood Control & Water Conservation District ("District"), the County of Riverside and the Cities of Murrieta, Temecula and Wildomar (collectively, the "Riverside County Copermittees").

These legal comments are in addition to the other comments on the Draft Permit and attachments made by the Riverside County Copermittees (including the Comment Letter dated January 10, 2013 and signed by Jason E. Uhley, Chief of the District's Watershed Protection Division) and the redline attachment ("Redline"), as well as any comments or testimony which may be offered at the public hearing(s) on the Draft Permit. The Comment Letter and Redline also discuss legal issues. The Riverside County Copermittees appreciate this opportunity to comment and welcome any questions that Water Board staff may have.

These comments are submitted subject to the same reservations set forth in the Comment Letter regarding the Water Board's lack of authority, in the absence of agreement by the Riverside County Copermittees or the filing of a Report of Waste Discharge ("ROWD"), to issue a regional municipal separate storm sewer system ("MS4") permit to the Riverside County Copermittees. Submission of these comments does not waive this objection.

Request for Additional Public Comment

Before turning to comments on the Draft Permit, the Riverside County Copermittees wish to note that in view of the extensive comments made by them, as well as what we anticipate will be extensive comments by the South Orange County and San Diego County Copermittees, as well as from other stakeholders, it would greatly facilitate the permit adoption process if the Water Board were to release a revised Tentative Order for further review and comment prior to final adoption of the Permit. This will enable the Water Board staff to address the comments in a more orderly fashion and provide all parties with the opportunity to see how staff proposes to incorporate the comments in the Draft Permit.

Comments on Findings

Finding 2 and Fact Sheet Section VII.B: This finding recites that the Water Board "has the legal authority to issue a regional MS4 permit pursuant to its authority under Clean Water Act ("CWA") section 402(p)(3)(B) and 40 CFR 122.26(a)(i)(v)." Section VII.B of the Fact Sheet provides a more detailed rationale for this finding (at pages F-22-23).

The Riverside County Copermittees respectfully disagree with this finding and the analysis provided in the Fact Sheet. We do not believe that a regional MS4 permit is authorized under the CWA or the implementing regulations, absent agreement by the copermittees to be bound by such a MS4 permit (as is the case with the Bay Area MS4 permit covering discharges into the Bay).

The CWA itself does not explicitly authorize MS4 permits that, like the Draft Permit, cross county lines. CWA section 402(p)(3)(B) provides only that "[p]ermits for discharges from municipal storm sewers . . . may be issued on a system- or jurisdiction-wide basis." This language, contrary to the conclusion in Finding 2, indicates that a multi-county permit, covering several distinct non-interconnected municipal stormwater "systems" in multiple watersheds with multiple receiving waters, is not one issued on a "system-wide" basis and that an MS4 permit covering multiple jurisdictions in three different counties is not one issued on a "jurisdiction-wide basis." Because neither "system-wide" nor "jurisdiction-wide" are defined in the CWA, however, the CWA regulations must also be reviewed.

The regulatory provision cited in Finding 2, 40 CFR § 122.26(a)(1)(v), does not add clarity, since it merely repeats the "system-wide" and "jurisdiction-wide" language of the Act and the regulations define neither term. The regulations do, however, suggest that "system-wide" is not intended to cover multiple large MS4s in different jurisdictions. The regulations, at 40 CFR § 122.26(a)(1)(v) state that in making the determination to designate a system-wide or jurisdiction-wide basis" the permitting authority should consider the location of the "discharge" with respect to waters of the United States, the size of the discharge, the quantity and nature of the pollutants discharge and other relevant factors.

The Draft Permit covers multiple "discharges" into receiving waters located in three separate counties and the size, quality and nature of the discharges vary widely, due to varying hydrologic and climatic conditions in the three areas.

The Fact Sheet cites 40 CFR § 122.26(a)(3)(iv), which provides, in relevant part, that the Water Board "may issue one systemwide permit covering all, or a portion of all municipal separate storm systems in adjacent or interconnected large or medium municipal separate storm sewer systems." This provision does not, however, authorize issuance of a regional MS4 permit covering multiple counties and multiple watersheds that are not interconnected and which do not share a common receiving water. In fact, the only common fact uniting the various MS4s in the three counties under the Water Board's jurisdiction is that common jurisdiction.

First, even if the subject MS4 facilities otherwise met the criteria specified in the federal regulations (which, as noted below, they do not), the prospective permittees must apply for such a MS4 permit, as set forth in the first sentence of 40 CFR § 122.26(a)(3)(iv): "*One permit application may be submitted for all or a portion of all* municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems." (emphasis supplied). No such application has been filed with respect to the Draft Permit. Only the San Diego County copermittees submitted a ROWD for MS4 facilities within that county.[1]

[1] Moreover, the fact that permittees have the ability to determine the geographic scope of the permit is reinforced by the language in 40 CFR § 122.26(a)(3)(iii)(B), which allows an individual municipality to submit "a distinct permit application which only covers discharges from the [MS4] for which the owner is responsible . . ." If a permittee can "opt out" of a multi-MS4 permit by submitting a individual permit application, a permitting authority such as a water board cannot impose a multi-MS4 permit on that permittee.

Second, this provision requires that the MS4s to be covered in the permit be "adjacent or interconnected." This is not true with respect to the MS4s proposed to be included within the Draft Permit. For example, the MS4 within the Santa Margarita Region of Riverside County is not "interconnected" with any other MS4s except those within that region. This is true also of the MS4s within South Orange County and San Diego County, which are not interconnected. Additionally, none of the MS4s in the three counties is "adjacent" to each other – each is separated by miles of non-urban area. In the SMR for example, the confluence of Temecula and Murrieta Creeks to form the Santa Margarita River is miles upstream of Rainbow Creek, the first discharge from San Diego County to the River. And, the confluence of Temecula and Murrieta Creeks is over 30 miles from the discharge of the Santa Margarita River to the Pacific Ocean.

The next inquiry is whether the three separate county MS4s could be considered, together, to form a single "large municipal separate storm sewer system." The federal MS4 regulations define this term as follows:

> *Large municipal separate storm sewer system* means all municipal separate storm sewers that are either:
>
> (i) Located in an incorporated place with a population of 250,000 or more . . . ."
>
> (ii) Located in the counties listed in Appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or
>
> (iii) Owned or operated by a municipality other than those described [in paragraphs (i) and (ii)] . . . and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described [in paragraphs (i) and (ii)]. In making this determination the Director may consider the following factors:
>
> (A) Physical interconnections between the municipal separate storm sewers;
>
> (B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in [paragraph (i)];
>
> (C) The quantity and nature of pollutants discharged to waters of the United States;
>
> (D) The nature of the receiving waters; and
>
> (E) Other relevant factors, or
>
> (iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region

> defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described [in paragraphs (i), (ii) or (iii)].

40 CFR § 122.26(b)(4).

None of paragraphs (i), (ii) or (iii) authorizes a regional MS4 permit such as that envisioned in the Draft Permit. The Draft Permit applies beyond a single incorporated place, County or municipality. Of these paragraphs, only paragraph (iv) could arguably be used to define the MS4s in the three Counties as a single MS4 and thus authorize a regional permit. The key limiting language is, however, "within the boundaries of a region **defined by a storm water management regional authority,** based on a jurisdictional, watershed, or other appropriate basis . . . ." A regional water board is not a stormwater management regional authority. This is clear from the MS4 regulations, which provide that a "**regional authority may be responsible for submitting a permit application"** under certain conditions. 40 CFR § 122.26(a)(3)(iii)(C). Clearly, a Water Board is not responsible for submitting MS4 permit applications.

U.S. EPA, in the Preamble to the final Phase I MS4 regulations (55 Fed Reg. 47990, November 16, 1990), further illuminated the meaning of the regulatory language. The Preamble indicates that commenters proposed eight different MS4 permitting options:

> Option 1 – systems owned or operated by incorporated places augmented by integrated discharges; Option 2 – systems owned or operated by incorporated places augmented with significant other municipal discharges; Option 3 – systems owned or operated by counties; Option 4 – systems owned and operated by States or State departments of transportation; Option 5 – systems within the boundaries of an incorporated place; Option 6 – systems within the boundaries of counties; Option 7 – systems in census designated urbanized areas; and Option 8 – systems defined by watershed boundaries.

55 Fed Reg. at 48039. None of these options encompasses the fact pattern presented by the Draft Permit, which covers multiple counties and multiple watersheds, are not interconnected, do not share common receiving waters and are located in separate census designated urbanized areas.

In explaining the derivation of 40 CFR 122.26(b)(4)(iv), U.S. EPA noted that it was "an outgrowth of comments on all options, especially Option 4 (State owned systems/State highways) and Option 8 (watersheds)." 55 Fed. Reg. at 48040. Thus, the Caltrans MS4 permit (which applies statewide) is authorized under paragraph (iv), since the "storm water management regional authority" defining the region to be covered is Caltrans itself. No such single authority exists for the three-county area proposed to be included in the Draft Permit, which also would encompass multiple watersheds.

Moreover, paragraph (iv) provides that the regional authority must "petition" the U.S. EPA Director to have a single MS4 designated within the boundaries of the region defined by the regional authority. Because California has been delegated NPDES permitting authority, a regional authority would presumably need to petition its Water Board to authorize such a regional permit. Since no such regional authority exists to establish the geographical basis for a three-county MS4 permit, there is no such entity to "petition" the Water Board to establish a regional permit. This is clear from the Preamble to the Phase I regulations, which indicate that "regional storm water authorities" established by "some States or counties" may "petition the Director [or its state designee] to assume a regional role. 55 Fed. Reg. at 48042. It is clear from the Preamble that it is not the Water Board that has the authority to make such a petition, but rather the "storm water authorities" (i.e., municipalities, districts and Caltrans).

It should be noted that the Bay Area Regional MS4 Permit was a joint Bay Area Water Board and copermittee effort, coordinated by the Bay Area Stormwater Agencies Management Association ("BASMAA"). It is not the case that the Bay Area Water Board imposed this regional MS4 permit. The copermittees, coordinated by BASMAA, themselves determined to develop a regional MS4 permit. Further, all of the copermittees to the Bay Area Regional MS4 Permit discharge to a common receiving water, San Francisco Bay. Also, an Alaska MS4 permit cited in a letter from the Office of Chief Counsel to county counsel for Orange and Riverside Counties was issued to several municipalities and entities within a single "borough," which is equivalent in Alaska to a county.

Additionally, neither the Riverside County Copermittees nor those in South Orange County have filed ROWDs with the San Diego Water Board, which serve as the application for an NPDES MS4 permit in California. Water Code § 13260. The current Riverside County MS4 permit for the Santa Margarita Region provides that the ROWD is not required to be filed until May 2015, 180 days prior to the November 10, 2015 expiration date of that permit. Order R9-2010-0016, Part II.K.2.c.

> This ROWD must include:
>
> (1) Proposed changes to the Copermittees' runoff management programs; (2) Proposed changes to monitoring programs; (3) Justification for proposed changes; (4) Name and mailing addresses of the Copermittees; (5) Names and titles of primary contacts of the Copermittees; (6) Any other information necessary for the reissuance of this Order and (7) Any other information required by federal regulations for permit reapplications.

Id. It should be noted that several items of this ROWD are specifically intended to assist in the formulation of a new, SMR-specific MS4 permit, including proposed changes to the runoff management and monitoring programs, as well as justification for such changes, information necessary for "reissuance" of the SMR MS4 permit and information required by the federal regulations for MS4 permit reapplications.

As a simple jurisdictional matter, the Water Board cannot issue a regional MS4 permit to MS4 dischargers that have not applied for it. Moreover, as noted above, the SMR copermittees are entitled to apply for an MS4 permit applicable to their jurisdiction. Further, each individual copermittee has the right to apply for a MS4 permit covering only its discharges, as has the City of Long Beach in the Los Angeles Region.

Finding 3, Finding 15, in Fact Sheet Section VII.A and in Multiple Locations Throughout Draft Permit: In Finding 3, the Fact Sheet and in multiple locations throughout the Draft Permit (which are identified in the redline of the Draft Permit submitted with these comments by the Riverside County Copermittees ("Redline")), it is stated that the maximum extent practicable ("MEP") applies only to "storm water" discharges from the MS4. This is not correct.[2]

In fact, the Clean Water Act does not distinguish between non-stormwater and stormwater in terms of MS4 discharges which must be controlled to the MEP standard. *See* 33 U.S.C. § 1342(p)(3)(B)(iii)(the MS4 permit "shall require controls to reduce the discharge of pollutants to the maximum extent practicable . . . ." While the heading of 33 U.S.C. § 1342(p) refers to "Municipal and industrial stormwater discharges," this is not dispositive, as 33 U.S.C. § 1342(p)(3)(B)(ii), which requires the effective prohibition of "non-stormwater discharges" into the MS4. Thus, the language of this heading does not in fact support the argument that the MEP standard applies only to pollutants in stormwater discharges.

That both non-stormwater and stormwater must be controlled to the MEP standard was made clear by U.S. EPA itself in the preamble to the final Phase I stormwater regulations. In that preamble, U.S. EPA made it clear that "MEP control measures" would be implemented to address not only pollutants in "storm water" but also from "non-storm water discharges." As the preamble states:

> "Permittees are required to develop management programs for four types of pollutant sources which discharge to large and medium municipal storm sewer systems. Discharges from [such systems] are usually expected to be composed primarily of: (1) Runoff from commercial and residential areas; (2) storm water runoff from industrial areas; (3) runoff from construction sites; and (4) *non-storm water discharges*. Part 2 of the permit application has been designed to allow [permittees] the opportunity to propose *MEP control measures for each* of these components of the discharge."

55 Fed. Reg. at 48052 (emphasis supplied).

This language sets forth USEPA's understanding of the plain language of the CWA: "pollutants" must be controlled to the MEP from any MS4 "discharge," not merely pollutants in stormwater.

Finding 11: This finding, in relevant part, states that "[h]istoric and current development makes use of natural drainage patterns and features as conveyances for runoff. Rivers, streams and creeks in developed areas used in this manner are part of the Copermittees' MS4s regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the rivers, streams and creeks in the developed areas of the Copermittees' jurisdictions are both an MS4 and receiving water." This conclusion is legally incorrect.

First, under no circumstance can a natural stream constitute an MS4. The definition of "MS4" in the CWA regulations (a definition found in Attachment C of the Draft Permit) refers to a

[2] Finding 15 also states, erroneously, that the MEP standard "is explicitly for "Municipal . . . *Stormwater Discharges* (emphasis added)" from the MS4.

"conveyance or system of conveyances" "owned or operated" by a municipality. 40 CFR §122.26(b)(8). In California, natural rivers and streams are not "owned" nor "operated" by the municipality through which they flow. Moreover, a municipality obviously cannot "operate" a natural creek or stream. In further support of the point that a MS4 is an artificial, not natural, watercourse, the types of "conveyances" identified in the regulation ("roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains") all refer to anthropogenic structures, not natural streams. 40 CFR § 122.26(b)(8).

Second, a "receiving water" cannot also be an MS4, as is plain from the CWA regulations. An MS4 is itself defined as discharging to waters of the United States. 40 C.F.R. §122.26(b)(8). An MS4 cannot, in essence, discharge to itself. Moreover, an "outfall" from an MS4 (the point at which the discharge enters a receiving water) does not, pursuant to 40 C.F.R §122.26 (b)(9), include conveyances connecting "segments of the same stream or other waters of the United States and are used to convey waters of the United States."

Moreover, U.S. EPA, in the Preamble to the initial version of the MS4 regulations (53 Fed. Reg. 49416 (Dec. 7, 1988)) expressly determined that "streams, wetlands and other water bodies that are waters of the United States are not storm sewers for the purposes of this rule" and that "stream channelization, and stream bed stabilization, which occur in waters of the United States" were not subject to National Pollutant Discharge Elimination System ("NPDES") permits under Section 402 of the CWA. 53 Fed. Reg. at 49442.

Additionally, the United States Supreme Court recently reversed the Ninth Circuit Court of Appeals and ruled that flows from sections of the Los Angeles and San Gabriel Rivers that are comprised of concrete flood control channels are not a "discharge" under the CWA, confirming that such rivers, even if improved, are "receiving waters" along with any natural portions of those rivers. *Los Angeles County Flood Control Dist. v. Natural Resources Defense Council*, 568 U.S. __(January 8, 2013) (slip op.).

The above-cited statement in the finding is incorrect and should be stricken, as recommended in the Redline.

Finding 12: This finding states, in relevant part, that "[a]s operators of the MS4s, the Copermittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or otherwise control." This statement is legally incorrect, and ignores the salient point that the "discharger" of a pollutant is primarily responsible for controlling/permitting that discharge, under both the CWA and the Porter-Cologne Act. For example, under the Porter-Cologne Act, any persons discharging or proposing to discharge "waste" into waters of the state must file a report of waste discharge and obtain a waste discharge requirement. Water Code §§ 13260, 13263. The operator of the MS4 into which that water eventually flows is not "essentially accepting" responsibility for the discharge. The responsibility of the MS4 operator is established under the CWA, and that is to effectively prohibit non-stormwater discharges into [the MS4] and to control the discharge of pollutants from the MS4 to the MEP.

Moreover, the statement ignores the fact that in California, downstream property owners (including municipalities owning and operating MS4 facilities) must accept the flow of upstream waters. In fact, for a downstream municipality to block such flow would constitute an inverse condemnation or the creation of a nuisance under California law. *See Arreola v. County of Monterey* (2002) 99 Cal.App.4th 722 (obstruction of flood waters by improperly designed highway constituted inverse condemnation and nuisance).

Finding 28 and Fact Sheet Section VI: In the Finding, it is stated that the Water Board "finds that the requirements in this permit are not more stringent than the minimum federal requirements" and that therefore "a CWC section 13241 analysis is not required." The Finding further recites that notwithstanding this fact, "the San Diego Water Board has developed an economic analysis of the requirements in this Order."

For the reasons set forth in the comments of the Riverside County Copermittees, numerous provisions in the Draft Permit are in fact more stringent than the requirements of the CWA and its implementing regulations and therefore require an adequate Water Code § 13241 analysis. Unfortunately, this analysis is not provided in the Fact Sheet.

First, the economic analysis set forth in the Fact Sheet does not meet the requirements of Section 13241, as it does not analyze the six specific factors required to be analyzed under the section. Second, the analysis uses cost data from other sources, only a few of which were from the municipalities proposed to be included under the Draft Permit. These data are also a number of years old; the most recent study referenced in the Fact Sheet, the one done for the State Board by Cal State Sacramento, was dated January 2005 and included decade-old cost data from the City of Encinitas that dated from 2002-2003.

Third, the section of the Fact Sheet discussing the benefits of water quality notes that "there have been no studies for the San Diego Region to quantify the added value that surface waters with healthy water quality can provide." Thus, the Water Board has no evidence with which to compare the costs and benefits of the programs set forth in the Draft Permit. Moreover, the discussion makes the incorrect assumption that the alternative to the programs in the Draft Permit would be no controls on pollutants in urban runoff. As the Fact Sheet correctly notes, the Draft Permit is the fifth term MS4 permit for the copermittees. The previous four permits all contained increasingly complex and expensive control requirements, both structural and non-structural, designed to improve the quality of MS4 discharges. Thus, an appropriate cost analysis must compare the incremental costs of the programs set forth in the Draft Permit and the incremental benefits attributable to that permit. This has not been done in the Fact Sheet. Finally, the analysis does not recognize that the receiving waters provided economic benefits to residents of the San Diego Region long before issuance of the first MS4 permits in 1990. It is thus illogical to suggest that these pre-existing economic benefits would be lost if the Draft Permit is not adopted.

Finding 29 and Fact Sheet Section VII.F: The finding and the supporting argument in the Fact Sheet represents an attempt by Water Board staff to address whether the requirements of the Draft Permit represent an unfunded state mandate. That attempt, however, is beyond the scope of the Water Board's powers, since the *only* agency charged by the Legislature with determining the presence of a state mandate, and whether that mandate is unfunded, is the Commission on State Mandates. Govt. Code § 17552; *Kinlaw v. State of California* (1991) 54 Cal.3d 326, 333. The Water Board has no jurisdiction to make a legal finding or discuss in the Fact Sheet that the Draft Permit, in whole or in part, does not constitute an unfunded state mandate.

Additionally fact sheets are required, under the CWA regulations, to provide the legal authority and reasons for each substantive permit provision (40 CFR § 124.8(a)(4); 40 CFR § 124.56(a)). *See also City of Rancho Cucamonga v. Regional Water Quality Control Board-Santa Ana Region* (2006), 135 Cal.App.4th 1377, 1382 (stating that fact sheets contains "the legal and factual grounds for the Water Board's recommendation to adopt the . . . permit"). Finding 29 and the discussion in Section VII.F of the Fact Sheet do not relate to any Draft Permit provision, nor provide legal authority or justification for the Draft Permit's adoption. As such, the finding and Fact Sheet discussion are surplussage and should be deleted.

The Riverside County Copermittees disagree with each of the arguments set forth in the Finding and Fact Sheet as to why the Draft Permit does not constitute an unfunded state mandate. Nevertheless, because the exclusive arena for such disagreements is the Commission on State Mandates, whose jurisdiction does not commence unless and until a test claim is filed before the Commission, the Copermittees need not and will not address those arguments.

Comments on Provisions in Draft Permit

Provision A and Fact Sheet Section VIII.A:

Lack of True Iterative Compliance Process

As set forth in the Redline and in the Comment Letter, the Riverside County Copermittees believe that to effectuate the iterative approach to compliance with water quality standards and other discharge prohibitions in the Draft Permit, the copermittees must be provided with the means to be in compliance. Based on monitoring, exceedances of water quality standards are occurring in the receiving waters subject to the Draft Permit, as set forth in Table G-14 to the latest 2011-2012 monitoring report submitted by the Riverside County Copermittees. Thus, if the copermittees are not provided an iterative means to be in compliance, which was contemplated by State Board's Order No. 2001-15, the copermittees will be issued an illegal MS4 permit, since it is a permit with which they cannot comply. This violates the intent of Congress in the CWA, which "is presumed not to have intended absurd (impossible) results." *Hughey v. JMS Development Corp.*, 78 F.3d 1523, 1529 (11th Cir. 1996); *accord, Mississippi River Revival v. City of Minneapolis*, 319 F.3d 1013, 1017-1018 (8th Cir. 2003).

With regard to the iterative process, Water Board staff has indicated numerous times during the workshop process that achievement of water quality standards is expected to take many years. The entire WQIP approach is aimed at the eventual attainment of such standards, as are the TMDLs issued to other copermittees, which have final compliance dates years into the future.

This approach is, however, put into jeopardy by the requirement, as expressed in the Fact Sheet at F-39, that the discharge prohibition and receiving water limitation provisions are "independently applicable, meaning that compliance with one provision does not provide a 'safe harbor' where there is non-compliance with another provision (i.e., compliance with Provision A.4 does not shield a Copermittee who may have violated Provision A.1.a, A.1.c, or A.2.a from an enforcement action." While the Fact Sheet appropriately notes how this process should work through Provision A.4 (which "essentially requires the Copermittees to implement additional BMPs until MS4 discharges no longer cause or contribute to a violation of water quality standards") it also states that despite this iterative process, "the San Diego Water Board retains the discretion to take other appropriate enforcement and the iterative process does not shield dischargers from citizen suits under the CWA." Fact Sheet at F-40.

The consequences of this approach cannot be overemphasized. Despite the copermittees' good faith undertaking to follow the iterative process outlined in Provision A.4, a Water Board enforcement proceeding or a citizen suit can be brought for violations of water quality standards and, if the citizen plaintiff is successful, a federal judge is empowered to use his/her injunctive powers under Section 505(a) of the CWA to throw out the WQIP, JRMP or other compliance efforts of the copermittees and require other efforts. In such a case, the time and money spent by the copermittees in trying to comply with the Draft Permit, as well as the effort spent by the copermittees and Water Board staff in developing the Draft Permit's terms, are completely wasted.

Thus, the essential conundrum of Provision A, as presently drafted, is clearly exposed. Even though a copermittee may spend significant sums and undertake significant tasks under its WQIP or JRMP, be conducting expensive monitoring and special studies, and be in *full compliance* with all of the programmatic requirements of the Draft Permit, it would still face either a Water Board enforcement action or a citizen suit under Section 505 of the CWA. And, such a suit would allege exceedances of water quality standards (some of which are hardly capable of laboratory detection, much less control) that the Water Board acknowledges cannot be achieved for years.

Provision A is not, however, required by the CWA, as held by the Ninth Circuit in *Defenders of Wildlife v. Browner*, 191 F.3d 1159 (9th Cir. 1999). The holding in *Browner* is further reflected in State Board Order WQ 2001-15 (which the Fact Sheet acknowledges incorporates an "iterative process") which states:

> [O]ur [receiving water limitation] language, similar to the U.S. EPA's permit language discussed in the Browner case, **does not require strict compliance with water quality standards.** Our language requires that **storm water management plans be designed to achieve compliance with water quality standards**. **Compliance is to be achieved over time, through an iterative approach requiring improved BMPs**. As pointed out by the Browner court, there is nothing inconsistent between this approach and the determination that the Clean Water Act does not mandate strict compliance with water quality standards.

Order WQ 2001-15 at 7 (emphasis added). Thus, Provision A is inconsistent with the State Board's own precedential order, which requires the iterative approach effectuated by the suggested Redline changes.[3]

In further support, it may be noted that the U.S. EPA-drafted MS4 permit for the District of Columbia does not contain the type of language found in Provision A, but rather requires "an iterative and an adaptive management process for pollutant reduction and for achieving applicable water quality standard and/or total maximum daily load (TMDL) compliance." DC MS4 Permit Fact Sheet, page 5 (attached as Exhibit A).

Also, despite the assertion in the Fact Sheet that the copermittees are seeking a "safe harbor" from liability, this is incorrect. Every provision of an MS4 permit is subject to enforcement; given the complexity of the Draft Permit, the failure by a copermittee to comply with any provision could lead to such enforcement.

As noted above, MS4 discharges may not be achieving compliance with strict water quality standards, as recognized by the Issue Paper released by State Board staff in preparation for a November 20, 2012 workshop on receiving water limitation issues raised by *NRDC v. County of Los Angeles*. That Issue Paper stated that as "the storm water management programs of municipalities have matured, **an increasing body of monitoring data indicates that water quality standards are in fact not being met by many MS4s.**" (State Board Issue Paper, Page 2, emphasis supplied) (*see* Exhibit B.)

Perhaps most importantly, requiring strict and immediate compliance with discharge prohibition and receiving water limitations inhibits, not supports, the philosophy of the Draft Permit, which is to encourage the copermittees to focus on the most significant problems in their watersheds and to prioritize their resources to address those problems. Provision A, by contrast, discourages innovative approaches or prioritization, since all pollutants exceeding water quality standards create liability. Moreover, as discussed above, in the event of a citizen suit being brought such as that in the *NRDC* case, a federal judge could award injunctive relief to a successful plaintiff that could completely ignore or supplant the WQIP and other permit terms.

For additional discussion of receiving water limitations issues, please see Exhibit C, a letter submitted by the District to the State Board in connection with the recent workshop held by the State Board on receiving water limitations language. The Riverside County Copermittees hereby reference and incorporate this Exhibit into these comments.

The Riverside County Copermittees support a true iterative process that requires refinement and amendment of the WQIP and associated BMPs when receiving water limitation violations are recorded. That is the essence of the iterative process; the identification of problems and the development of BMPs to attempt to address those problems.

[3] While the Fact Sheet cites as authority *Natural Resources Defense Council v. County of Los Angeles,* discussed above, the Ninth Circuit was simply responding to language in the former Los Angeles County MS4 permit, and did not determine that such non-iterative language was required by the CWA.

The Redline proposes a means to achieve compliance using the WQIPs, which are intended to bring the copermittees into compliance with the discharge prohibition and receiving water limitation provisions of the Draft Permit over time. The Redline links compliance with Provisions A.1, A.2 and A.3 to A.4, which indicates that compliance is obtained through the preparation and updating of the WQIPs.

It must be noted, however, that the Riverside County Copermittees do not agree with the approach suggested by others, that any WQIP-based compliance approach be necessarily accompanied by a "Reasonable Assurance Analysis." Such an analysis could be extremely complex, expensive and time intensive to develop. Generally, such analyses are developed in the preparation of TMDLs and take a number of years to develop and refine. Given that the Santa Margarita Watershed has no adopted TMDLs, there are no comprehensive pollutant transport or BMP models available for the suite of constituents that might be considered for prioritization within a WQIP for that watershed. In the context of a TMDL, such models would be developed by the combined resources of the Water Board, stakeholders and dischargers. Requiring such an exercise to be undertaken solely with the public resources of the residents of the SMR is beyond the Copermittees' financial ability and would shift responsibility for development of TMDLs from the Water Board to the Copermittees.

Discussion in Fact Sheet

The Fact Sheet discussion also contains a number of legal and factual errors. First, the statement on page F-34 that non-stormwater discharges from the MS4 are subject to NPDES permitting requirements is unsupported by the plain language of the CWA, which (as noted above) applies the MEP standard to *all* discharges of pollutants from the MS4, not just those in stormwater. Also, such discharges are not subject to separate requirements under the NPDES program, as suggested on F-34, and non-storm water discharges are not the same, legally, as "illicit discharges." Please see discussion below.

Similarly, the Fact Sheet's conclusion that "Regional Water Boards are not limited by the iterative MEP approach to storm water regulation in crafting appropriate regulations for non-storm water discharges" is incorrect. The Fact Sheet correctly states that MEP has not been defined in the CWA or by U.S. EPA in the CWA regulations. However, the Fact Sheet incorrectly concludes that MEP is "ultimately defined" by the Water Boards or the State Board. What constitutes "MEP" is a question of federal law under the CWA, not a matter for definition by agencies which merely have been delegated the authority to enforce the CWA in California. The only source for such a finding is a memorandum from a State Board attorney, not case authority.

Moreover, Provisions B-E of the Draft Permit, far from establishing a "minimum framework" for the copermittees to achieve the MEP standard, sets forth in many cases requirements that far exceed the plain requirements of the CWA, the implementing regulations and in some cases even state law, or which require the copermittees to undertake steps that are not "practicable." These requirements are identified in the comments of the Riverside County Copermittees. In such respects, those requirements do not represent a "minimum framework" for MEP.

Other Issues

The Riverside County Copermittees also object to the provision in A.1.a and other portions of the Draft Permit that prohibit certain discharges into “waters of the state.” The CWA regulates discharges into waters of the United States, which are surface waters. Expanding the prohibition to cover waters of the state expands the scope of the Draft Permit to protect groundwater, as a matter of state law. It should be noted that the recent Los Angeles County MS4 Permit appropriately applies this prohibition to waters of the United States.

Provision B.5: As noted in the Comment Letter, the CWA requires that illegal discharges into the MS4 be addressed by a program of steps taken to address such discharges. The Redline emphasizes that this program be guided by WQIP priorities, which is consistent with the overall intent of the Draft Program.

Provision E.2.a and E.2.a.(7): These provisions require the Copermittees to, as a part of their Illicit Discharge Detection and Elimination (IDDE) program, address all non-stormwater discharges as “illicit discharges,” thus requiring the copermittees to “reduce or eliminate non-stormwater discharges” whether or not the discharges have been identified as “illicit.”

The Fact Sheet asserts that “Provision E.2.a.(7) is consistent with the requirements of the CWA section 402(p)(3)(B)(ii) and 40CFR 122.26(d)(1)(v)(B). That assertion is not correct. Section 402(p)(3)(B)(ii) of the CWA states that MS4 permits “shall include a requirement to *effectively prohibit* non-stormwater discharges into the storm sewers” (emphasis supplied). The CWA regulations include two provisions designed to begin implementation of the “effective prohibition.” The first provision requires MS4 permittees to perform a screening analysis, intended to provide sufficient information to develop priorities for a program to detect and remove illicit discharges. 40 CFR 122.26(d)(1)(iv)(D). The second requires MS4 permittees to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to MS4s. 40 CFR 122.26(d)(1)(iv)(D) and 122.26(d)(2)(B). The MS4 permittees are required to identify the non-stormwater discharge as an illicit discharge prior to having an obligation to effectively prohibit it. There is not otherwise a presumption to reduce or eliminate it.

40 CFR 122.26(d)(1)(v)(B), cited in the Fact Sheet, requires “[a] description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.”

The provision and rationale within the Fact Sheet blur the distinction between the copermittees’ need to “effectively” prohibit non-stormwater discharges and to detect and eliminate illicit discharges.

- The requirement is “effectively prohibit” non-stormwater discharges, not “reduce or eliminate” non-stormwater discharges.
- Although copermittees are required to have a program to prevent illicit discharges to the MS4, non-stormwater discharges should only be addressed as illicit discharges where

such discharges are identified as sources of pollutants that may cause or contribute to an exceedance of a water quality objective.

- The IDDE program is established to detect and eliminate “illicit discharges”, not non-stormwater discharges in general.

Please see the Redline for modifications to Provision E.2 addressing these issues.

Provision E.2.a.(3): In the Redline, the Riverside County Copermittees request that categories of irrigation runoff discharges (landscape irrigation, irrigation water and lawn watering) be considered as conditionally exempt discharges (not subject to treatment as illicit discharges).

The rationale for not including irrigation runoff discharges lacks a legal and factual basis. As noted in the Comment Letter, the only factual basis for this provision with respect to the Riverside County Copermittees is discussion in a public information informational brochure, which was itself based on a similar document from Orange County. Fact Sheet F-76. Despite assertions to the contrary in the Fact Sheet, this brochure does not represent a determination by the Riverside County Copermittees that irrigation runoff is a category of non-stormwater discharge that must be effectively prohibited. The other evidence in support of prohibiting the conditional exemption for irrigation runoff is entirely from different areas of the region, with different urban development patterns, lithology and hydrology. No specific determination has been made by the Copermittees (or the Water Board) that irrigation runoff in the Santa Margarita Region has actually been shown to be significant source of pollutants to receiving waters in the SMR.

EPA, in the preamble to the federal MS4 regulations, required that a *permittee* must make a finding that the “irrigation water” discharges must be a “source of pollutants to waters of the United States . . . .” 55 Fed. Reg. 48037. Moreover, such discharges must represent a “significant” source of pollutants to waters of the United States “under certain conditions.” U.S. EPA, *Guidance Manual for the Preparation of Part 2 of the NPDES Permit Application for Discharges from Municipal Separate Storm Sewer Systems*, November 1992 (“EPA Part 2 Guidance Manual”), at p. 6-33. These conditions require a focus not on an entire category of discharges, but rather a discharger-by-discharger examination.

In the MS4 regulatory preamble, EPA stated that “[i]n general, municipalities will not be held responsible for prohibited some specific components of discharges or flows listed below through their [MS4], even though such components may be considered non-storm water discharges, unless such discharges *are specifically identified on a case-by-case basis as needing to be addressed.”* 55 Fed. Reg. 47995 (emphasis supplied). In the Guidance Manual, EPA states:

> If an applicant knows . . . that landscape irrigation water from a ***particular site*** flows through and picks up pesticides **or *excess*** nutrients from fertilizer applications, there may be a reasonable potential for a storm water discharge to result in a water quality impact. In such an event, the applicant should contact the NPDES permitting authority to request that the authority order ***the discharger*** . . . to obtain a separate NPDES permit (or in this case, the discharge could be controlled through the storm water management program of the MS4).

EPA Part 2 Guidance Manual, p. 6-33 (emphasis added). Read in this context of this language, the Water Board has no power greater than a municipality in terms of its ability to identify non-stormwater discharges as "illicit" and thus required to be regulated, and must identify specific discharges, and not entire categories of discharges. *See* 55 Fed. Reg. 48037. This has not been done in the Fact Sheet.

Provision E.3(c): This provision requires the Copermittees to compel development projects that may not result in a hydromodification impact to the applicable receiving waters, to implement on-site or "alternative compliance" hydromodification mitigation measures and to use using "pre-development (naturally occurring)" runoff reference condition as applied to sites that are, in fact, developed.

The Riverside County Copermittees are concerned that implementing these requirements would subject the Copermittees to liability under the takings clauses of the U.S. and California Constitutions as well as under the Mitigation Fee Act because of the questionable nexus between such a project's lack of actual hydromodification impacts upon the receiving waters, and the hydromodification management measures required in the Draft Permit.

When imposing a condition on a development permit, a local government is required under the federal and state constitutions to establish that the condition bears a reasonable relationship to the impacts of the development project. This rule applies even to legislatively enacted requirements and impact fees or exactions.[4] Moreover, fees imposed on a discretionary ad hoc basis are subject to heightened scrutiny under a two-part test. First, local governments must show that there is a substantial relationship between the burden created by the impact of development and any fee or exaction.[5] Second, a development project's impacts must bear a "rough proportionality" to any development fee or exaction.[6] Under California law, the *Nollan/Dolan* heightened scrutiny test also applies to in-lieu fees.[7]

The Legislature has memorialized these requirements in the Mitigation Fee Act, which establishes procedures that local governments must follow to impose impact fees.[8] Irrespective of whether the hydromodification management requirements are implemented by legislative act or on an ad hoc basis, the copermittees' attempt to enforce them as proposed in the Draft Permit would likely result in claims by developers and property owners alleging unconstitutional takings of private property and violations of the Mitigation Fee Act. This is because a developer could argue that limiting hydromodification impacts of already developed property to its "naturally occurring" state, or requiring hydromodification mitigation measures for impacts not imposed by the project, would not have a legally sufficient nexus to the impact of the development project.

In addition, the Copermittees wish to bring the Water Board's attention to a recent case, *Virginia Dept. of Transportation v. United States Environmental Protection Agency,* Civ. Action No.

[4] *Building Indus. Ass'n v. City of Patterson* (2009)171 Cal. App. 4th 886, 898.
[5] *Nollan v. California Coastal Comm'n*, 483 U.S. 825, 837 (1987).
[6] *Dolan v. City of Tigard*, 512 U.S. 374, 391 (1994).
[7] *Ehrlich v. City of Culver City* (1996) 12 Cal. 4th 854, 876.
[8] Cal. Gov't Code §§ 66000-66025.

1:12-CV-775 (E.D. Va. January 3, 2013) (slip op.), which is attached for the Water Board's convenience as Exhibit D. In this case, a federal district judge found that the CWA did not authorize U.S. EPA to regulate stormwater itself as a pollutant. The impact of this case is not known at this time, as it will probably be appealed to the Fourth Circuit Court of Appeals. Still, any approach to hydromodification which focuses on flows *per se*, as opposed to pollutants, may not withstand legal scrutiny.

Provision E.3.c.(3)(c)(i): This provision requires the entire alternative compliance in-lieu fee to be transferred to the copermittee or an escrow account prior to construction of a Priority Development Project (PDP). This provision is problematic, as development fees (which would include the in-lieu fees) are collected at the time of building permit issuance. In large-scale projects, permits may be issued (and development fees collected) in phases. Further, for master-planned developments, fees are generally negotiated through a development agreement to be collected based on certain development milestones. Therefore, collecting and holding the entire in-lieu fee prior to construction interferes with the development practice and may violate the Mitigation Fee Act and local development ordinances. The Redline requests that in-lieu fees be collected in accordance with state and local law.

Provision E.5: In addition to other comments on this provision and others in the Draft Permit relating to retrofitting, any requirements in Draft Permit relating to the retrofitting of engineered channels and other structures employed for flood control purposes must be consistent with the judgment of the flood control districts, to which the Legislature has assigned sole authority for the protection of the lives and property of their citizens from flooding. (Please see Comment Letter and proposed new findings in Redline for further discussion). Due to the urbanization of the counties over the past 150 years, as well as the particular topography and weather conditions found in Southern California, there is a great risk of flooding and hence the need for flood control structures and channels. The flood control districts have both the expertise and the sole legal authority to determine whether retrofitting of flood control structures can be accomplished in light of their statutory obligations, and that expertise and authority must be recognized in the Draft Permit.

Provision E.8: As noted in the Redline, the first requirement under Fiscal Analysis, that each "Copermittee must secure the resources necessary to meet all the requirements of this Order" has been deleted. This requirement is not found in the CWA regulations, which require only the conduct of a fiscal analysis. Moreover, this requirement intrudes on the home rule power of cities and counties by requiring, in essence, that municipal budgets must reflect the priority of compliance with the Order over any competing obligation, including police, fire protection and public health. A key issue in complying with stormwater and MS4 obligations is the ability of municipalities to afford the increasing costs associated with those obligations. In California, of course, the ability to raise taxes to pay for such obligations has been severely curtailed through several voter-approved propositions.

The Riverside County Copermittees request that Provision E.8.a be deleted.

EXHIBIT A

NPDES Permit No. DC0000221

AUTHORIZATION TO DISCHARGE UNDER THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM MUNICIPAL SEPARATE STORM SEWER SYSTEM PERMIT

In compliance with the provisions of the Clean Water Act, 33 U.S.C. §§ 1251 *et seq.*

Government of the District of Columbia
The John A. Wilson Building
1350 Pennsylvania Avenue, N.W.
Washington, D.C. 20004

is authorized to discharge from all portions of the municipal separate storm sewer system owned and operated by the District of Columbia to receiving waters named:

Potomac River, Anacostia River, Rock Creek and stream segments tributary to each such water body

in accordance with the Stormwater Management Program(s) dated February 19, 2009, subsequent updates, and related reports, strategies, effluent limitations, monitoring requirements and other conditions set forth in Parts I through IX herein.

The effective issuance date of this permit is: October 7, 2011.

This permit and the authorization to discharge shall expire at midnight, on: October 7, 2016.

Signed this 30th day of September, 2011.

Jon M. Capacasa, Director
Water Protection Division
U.S. Environmental Protection Agency
Region III

1. DISCHARGES AUTHORIZED UNDER THIS PERMIT

1.1 Permit Area

This permit covers all areas within the jurisdictional boundary of the District of Columbia served by, or otherwise contributing to discharges from, the Municipal Separate Storm Sewer System (MS4) owned or operated by the District of Columbia. This permit also covers all areas served by or contributing to discharges from MS4s owned or operated by other entities within the jurisdictional boundaries of the District of Columbia unless those areas have separate NPDES MS4 permit coverage or are specifically excluded herein from authorization under the District's stormwater program. Hereinafter these areas collectively are referred to as "MS4 Permit Area".

1.2 Authorized Discharges

This permit authorizes all stormwater point source discharges to waters of the United States from the District of Columbia's MS4 that comply with the requirements of this permit. This permit also authorizes the discharge of stormwater commingled with flows contributed by process wastewater, non-process wastewater, or stormwater associated with industrial activity provided such discharges are authorized under separate NPDES permits.

This permit authorizes the following non-stormwater discharges to the MS4 when appropriate stormwater activities and controls required through this permit have been applied and which are: (1) discharges resulting from clear water flows, roof drainage, dechlorinated water line flushing, landscape irrigation, ornamental fountains, diverted stream flows, rising ground waters, uncontaminated ground water infiltration to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation waters, springs, footing drains, lawn watering, individual resident car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, wash water, fire fighting activities, and similar types of activities; and (2) which are managed so that water quality is not further impaired and that the requirements of the federal Clean Water Act, 33 U.S.C. §§ 1251 *et seq.*, and EPA regulations are met.

1.3 Limitations to Coverage

1.3.1 Non-stormwater Discharges

The permittee, as defined herein, shall effectively prohibit non-stormwater discharges into the MS4, except to the extent such discharges are regulated with an NPDES permit.

1.3.2 Waivers and Exemptions

This permit does not authorize the discharge of any pollutant from the MS4 which arises from or is based on any existing waivers and exemptions that may otherwise apply and are not consistent with the Federal Clean Water Act and other pertinent guidance, policies, and regulations. This narrative prohibition on the applicability of such waivers and exemptions extends to any activity that would otherwise be authorized under District law, regulations or ordinance but which impedes the reduction or control of pollutants through the use of stormwater control measures and/or prevents compliance with the narrative /numeric effluent limits of this permit. Any such discharge not otherwise authorized may constitute a violation of this permit.

1.4 Discharge Limitations

The permittee must manage, implement and enforce a stormwater management program (SWMP) in accordance with the Clean Water Act and corresponding stormwater NPDES regulations, 40 C.F.R. Part 122, to meet the following requirements:

1.4.1. Effectively prohibit pollutants in stormwater discharges or other unauthorized discharges into the MS4 as necessary to comply with existing District of Columbia Water Quality Standards (DCWQS);

1.4.2. Attain applicable wasteload allocations (WLAs) for each established or approved Total Maximum Daily Load (TMDL) for each receiving water body, consistent with 33 U.S.C. § 1342(p)(3)(B)(iii); 40 C.F.R. § 122.44(k)(2) and (3); and

1.4.3. Comply with all other provisions and requirements contained in this permit, and in plans and schedules developed in fulfillment of this permit.

Compliance with the performance standards and provisions contained in Parts 2 through 8 of this permit shall constitute adequate progress toward compliance with DCWQS and WLAs for this permit term.

2. LEGAL AUTHORITY, RESOURCES AND STORMWATER PROGRAM ADMINSTRATION

2.1 Legal Authority

2.1.1 The permittee shall use its existing legal authority to control discharges to and from the Municipal Separate Storm Sewer System in order to prevent or reduce the discharge of pollutants to achieve water quality objectives, including but not limited to applicable water quality standards. To the extent deficiencies can be addressed through regulation or other Executive Branch action, the permittee shall remedy such deficiencies within 120 days. Deficiencies that can only be addressed through legislative action shall be remedied within 2 years of the effective date of this permit, except where otherwise stipulated, in accordance with the District's legislative process. Any changes to or deficiencies in the legal authority shall be explained in each Annual Report.

2.1.2 No later than 18 months following the effective date of this permit, the District shall update and implement Chapter 5 of Title 21 of District of Columbia Municipal Regulations (Water Quality and Pollution) ("updated DC Stormwater Regulations"), to address the control of stormwater throughout the MS4 Permit Area. Such regulations shall be consistent with this

To Each Such Water Body

INTRODUCTION:

Today's action finalizes reissuance of the District of Columbia Municipal Separate Storm Sewer System (MS4) Permit. In the Final Permit EPA has continued to integrate the adaptive management approach with enhanced control measures to address the complex issues associated with urban stormwater runoff within the corporate boundaries of the District of Columbia, where stormwater discharges via the Municipal Separate Storm Sewer System (MS4).

Since the United States Environmental Protection Agency, Region III (EPA) issued the District of Columbia (the District) its first MS4 Permit in 2000, the Agency has responded to a number of legal challenges involving both that Permit (as well as amendments thereto) and the second-round MS4 Permit issued in 2004. For the better part of ten years, the Agency has worked with various parties in the litigation, including the District and two non-governmental organizations, Defenders of Wildlife and Friends of the Earth, to address the concerns of the various parties. The Agency has engaged in both litigation and negotiation, including formal mediation.[1] These activities ultimately led to an enhanced stormwater management strategy in the District, consisting of measurable outputs for addressing the issues raised during the litigation and mediation process.

FACILITY BACKGROUND AND DESCRIPTION:

The Government of the District of Columbia owns and operates its own MS4, which discharges stormwater from various outfall locations throughout the District into its waterways.[2]

On April 21, 2010 EPA public noticed the Draft Permit. The Draft Fact Sheet published with that Draft Permit contains more extensive permit background information, and the reader is referred to that document for the history of the District of Columbia MS4 permit.

The public comment period closed on June 4, 2010. EPA received comments from 21 individual commenters and an additional 53 form letters. The Draft Permit, Draft Fact Sheet, and comments received on those documents are all available at: http://www.epa.gov/reg3wapd/npdes/draft_permits.html. The Final Permit reflects many of the comments received. EPA is simultaneously releasing a responsiveness summary responding to these comments.

ACTION TO BE TAKEN:

EPA is today reissuing the District of Columbia NPDES MS4 Permit. The Final Permit replaces the 2004 Permit, which expired on August 18, 2009 and has been administratively extended since that time. The Final Permit incorporates concepts and approaches developed from studies and pilot projects that were planned and implemented by the District under the 2000 and 2004 MS4 permits and modifying Letters of Agreement, and implements Total Maximum Daily Loads (TMDLs) that have been finalized since the prior permit was issued, including the Chesapeake Bay TMDL. A number of applicable measurable performance standards have been incorporated into the Final Permit. These and other changes between the 2004 Permit and today's Final Permit are reflected in a Comparison Document that is part of today's Permit issuance.

WATER QUALITY IN DISTRICT RECEIVING WATERS:

The District's *2008 Integrated Report to the Environmental Protection Agency and U.S. Congress Pursuant to Sections 305(b) and 303(d) Clean Water Act*[3] documents the serious water

1 A procedural history of Permit appeals can be viewed at the EPA Environmental Appeals Board web: http://yosemite.epa.gov/oa/EAB_Web_Docket.nsf/77355bee1a56a5aa8525711400542d23/b5e5b68e89edabe98525714f00731c6f!OpenDocument&Highlight=2,municipal.

2 Portions of the District are served by a combined sanitary and storm sewer system. The discharges from the combined sewer system are not subject to the MS4 permit, but are covered under NPDES Permit No. xxxx issued to the District of Columbia Water and Sewer Authority.

3 District Department of the Environment, *The District of Columbia Water Quality Assessment, 2008 Integrated Report to the Environmental Protection Agency and U.S. Congress Pursuant to Sections 305(b) and 303(d) Clean Water Act* (hereinafter "2008 Integrated Report").

quality impairments in the surface waters in and around the District. A number of the relevant designated uses are not being met, *e.g.*, aquatic life, fish consumption, and full body contact, and there are a number of specific pollutants of concern that have been identified (for additional discussion on relevant TMDLs *see* Section 4.10 of this Final Fact Sheet).

Commenters on the Draft Permit expressed some frustration over very slow progress or even lack of progress after a decade of implementation of the MS4 program and even longer for other water quality programs. EPA appreciates this concern. Although the District's receiving waters are affected by a range of discharge sources, discharges from the MS4 are a significant contributor of pollutants and cause of stream degradation. EPA also recognizes, however, that stormwater management efforts that achieve a reversal of the ongoing degradation of water quality caused by urban stormwater discharges entail a long term, multi-faceted approach.

Consistent with the federal stormwater regulations for characterizing discharges from the MS4 (40 C.F.R. §122.26(d)(2)(iii)), the first two permit terms for the District's MS4 program required end-of-pipe monitoring to determine the type and severity of pollutants discharging via the system. The monitoring program was not designed to evaluate receiving water quality *per se*, therefore detection of trends or patterns was not reasonably possible. Today's Final Permit includes requirements for a Revised Monitoring Program, and one of the objectives for the program is to use a suite of approaches and indicators to evaluate and track water quality over the long-term (*see* discussion of Section 5.1 in this Final Fact Sheet).
There have been identified improvements in some areas. For example the *2008 Integrated Report* noted improvements in the diversity of submerged aquatic vegetation in the Potomac River, as well as improvements in fish species richness in Rock Creek. Biota metrics are often the best indicators of the integrity of any aquatic system.

EPA also notes that there are a variety of indirect measures indicative of improvement. The federal stormwater regulations foresaw the difficulty, especially in the near-term, of detecting measurable improvement in receiving waters, and relied instead on indirect measures, such as estimates of pollutant load reductions (40 C.F.R. §122.26(d)(2)(v)). The District documents these types of indirect measures in its annual reports, *e.g.*, tons of solids collected from catch basin clean-outs, amount of household hazardous waste collected, number of trees planted, square footage of green roofs installed, and many other measures of success.[4]

EPA believes that documenting trends in water quality, whether improvements, no change, or even further degradation, is an important element of a municipal water quality program. Today's Final Permit recognizes this principle, both in the types of robust measures required as well as the transition to new monitoring paradigms. EPA encourages all interested parties to provide the District with input during the development of these program elements.

THIS FACT SHEET:

(http://ddoe.dc.gov/ddoe/frames.asp?doc=/ddoe/lib/ddoe/information2/water.reg.leg/DC_IR_2008_Revised_9-9-2008.pdf

4 District MS4 Annual Reports can be found at: http://ddoe.dc.gov/ddoe/cwp/view.a,1209,q,495855.asp

This Final Fact Sheet is organized to correspond with the chronological organization and numbering in today's Final Permit. Where descriptions or discussions may be relevant to more than one element of the Final Permit the reader will be referred to the relevant section(s).

To keep today's Final Fact Sheet of readable length, many of the elements included in the fact sheet published with the Draft Permit (Draft Fact Sheet) on April 21, 2010 have not been repeated, but are referenced. Readers are referred to the Draft Fact Sheet published with the Draft Permit for additional discussion on provisions that have been finalized as proposed.[5] The Final Fact Sheet does discuss significant changes since the 2004 Permit (even if discussed in the Draft Fact Sheet). The Final Fact Sheet also contains additional explanation of the Final Permit where commenters requested additional clarification. In addition, this Final Fact Sheet explains modifications to the Final Permit where provisions were changed in response to comments.

In many cases EPA made a number of very simple modifications to the Final Permit, *e.g.*, a word, phrase, or minor reorganization, simply for purposes of clarification. These modifications were not intended to change the substance of the permit provisions, only to clarify them. Most of those types of edits are not discussed in this Final Fact Sheet, but EPA has provided a Comparison Document of the Draft and Final Permits for readers who would like that level of detail.

Many commenters noted that the Draft Permit was not logically organized. EPA agrees. The major reorganization principles include:

1) There is a new Section 3, Stormwater Management Program (SWMP) Plan consolidating the various plans, strategies and other documents developed in fulfillment of permit requirements.
2) All implementation measures, *i.e.*, those stipulating management measures and implementation policies, are included in Section 4 of today's Final Permit. This includes "Source Identification" elements (Section 3 in the Draft Permit) and "Other Applicable Provisions" elements (Section 8 in the Draft Permit), which included TMDL requirements.
3) All monitoring requirements are consolidated in Section 5 of the Final Permit.
4) All reporting requirements are consolidated in Section 6 of the Final Permit.

EPA also refers readers to the Responsiveness Summary released today along with the Final Permit and Final Fact Sheet, for responses to comments and questions received on the Draft Permit. That document contains additional detailed explanations of the rationale for changes made to the Draft Permit in the Final Permit.

Finally, EPA made significant effort to avoid appending or incorporating by reference other documents containing permit requirements into the Final Permit. In the interest of clarity

5 The Permit and Fact Sheet proposed on April 21, 2010 can be viewed at: http://www.epa.gov/reg3wapd/npdes/draft_permits.html

and transparency EPA, to the extent possible, has included all requirements directly in the permit. Thus, EPA reviewed a variety of documents with relevant implementation measures, *e.g.*, TMDL Implementation Plans and the 2008 Modified Letter of Agreement to the 2004 permit[6], and translated elements of those plans and strategies into specific permit requirements that are now contained in the Final Permit. This Fact Sheet provides an explanation of the sources of provisions that are significant and are a direct result of one of those strategies.

1. DISCHARGES AUTHORIZED UNDER THIS PERMIT

(1.2 Authorized Discharges): The Final Permit authorizes certain non-stormwater discharges, including discharges from water line flushing. One commenter noted that many of these discharges, especially from potable water systems, contain concentrations of chlorine that may exceed water quality standards. EPA agrees, and has therefore clarified that dechlorinated water line flushing is authorized to be discharged under the Final Permit.

(1.4 Discharge Limitations): Comments on the language in Part 1.4 varied widely. Some commenters did not believe it was reasonable to require discharges to meet water quality standards. Other commenters believed this to be an unambiguous requirement of the Clean Water Act.

Today's Final Permit is premised upon EPA's longstanding view that the MS4 NPDES permit program is both an iterative and an adaptive management process for pollutant reduction and for achieving applicable water quality standard and/or total maximum daily load (TMDL) compliance. *See generally,* "National Pollutant Discharge Elimination System Permit Application Regulations for Stormwater Discharges," 55 F.R. 47990 (Nov. 16, 1990).

EPA is aware that many permittees, especially those in highly urbanized areas such as the District, likely will be unable to attain all applicable water quality standards within one or more MS4 permit cycles. Rather the attainment of applicable water quality standards as an incremental process is authorized under section 402(p)(3)(B)(iii) of the Clean Water Act, 33 U.S.C. § 1342(p)(3)(B)(iii), which requires an MS4 permit "to reduce the discharge of pollutants to the maximum extent practicable" (MEP) "and such other provisions" deemed appropriate to control pollutants in municipal stormwater discharges. To be clear, the goal of EPA's stormwater program is attainment of applicable water quality standards, but Congress expected that many municipal stormwater dischargers would need several permit cycles to achieve that goal.

Specifically, the Agency expects that attainment of applicable water quality standards in waters to which the District's MS4 discharges, requires staged implementation and increasingly more stringent requirements over several permitting cycles. During each cycle, EPA will continue to review deliverables from the District to ensure that its activities constitute sufficient progress toward standards attainment. With each permit reissuance EPA will continue to increase

6 District Department of the Environment, *Modification to the Letter of Agreement dated November 27, 2007 for the NPDES Municipal Separate Storm Sewer (MS4) Permit DC0000222* (2008) http://www.epa.gov/reg3wapd/npdes/pdf/DCMS4/Letter.PDF

stringency until such time as standards are met in all receiving waters. Therefore today's Final Permit is clear that attainment of applicable water quality standards and consistency with the assumptions and requirements of any applicable WLA are requirements of the Permit, but, given the iterative nature of this requirement under CWA Section 402(p)(3)(B)(iii), the Final Permit is also clear that "compliance with all performance standards and provisions contained in the Final Permit shall constitute adequate progress toward compliance with DCWQS and WLAs for this permit term" (Section 1.4).

EPA believes that permitting authorities have the obligation to write permits with clear and enforceable provisions and thus the determination of what is the "maximum extent practicable" under a permit is one that must be made by the permitting authority and translated into provisions that are understandable and measurable. In this Final Permit EPA has carefully evaluated the maturity of the District stormwater program and the water quality status of the receiving waters, including TMDL wasteload allocations. In determining whether certain measures, actions and performance standards are practicable, EPA has also looked at other programs and measures around the country for feasibility of implementation. Therefore today's Final Permit does not qualify any provision with MEP thus leaving this determination to the discretion of the District. Instead each provision has already been determined to be the maximum extent practicable for this permit term for this discharger.

EPA modified the language in the Final Permit to provide clarity on the expectations consistent with the preceding explanation. Specifically Section 1.4.2 of the Final Permit requires that discharges 'attain' applicable wasteload allocations rather than just 'be consistent' with them, since the latter term is somewhat ambiguous.

In addition, the general discharge limitation 'no increase in pollutant loadings from discharges from the MS4 may occur to receiving waters' was removed because of the difficulty in measuring, demonstrating and enforcing this provision. Instead, consistent with EPA's belief that the Final Permit must include all of the enforceable requirements that would achieve this principle, the following discharge limitation is substituted: "comply with all other provisions and requirements contained in this permit, and in plans and schedules developed in fulfillment of this permit."

In addition, EPA made the following modifications: "Compliance with <u>the</u> performance standards and provisions contained in <u>Parts 2 through 8 of</u> this permit shall constitute adequate progress towards compliance with DCWQS <u>and WLAs for this permit term</u>" (*underlined text added*) (Section 1.4 of the Final Permit). EPA eliminated circularity with the addition of "Parts 2 through 8", clarifying that this requirement does not circle back to include the statements in 1.4.1 and 1.4.2, but rather interprets them. Also, although WLAs are a mechanism for attainment of water quality standards, EPA added the specific language "and WLAs" to make this concept explicit rather than just implicit. In addition this revised language emphasizes that the specific measures contained in the Final Permit, while appropriate for this permit term, will not necessarily constitute full compliance in subsequent permit terms. It is the expectation that with each permit reissuance, additional or enhanced requirements will be included with the objective of ensuring that MS4 discharges do not cause or contribute to an exceedance of applicable water quality standards, including attainment of relevant WLAs.

2. LEGAL AUTHORITY, RESOURCES, AND STORMWATER PROGRAM ADMINISTRATION

(2.1 Legal Authority): Several commenters pointed out that there were a number of requirements in the Draft Permit without clear compliance schedules or deadlines, or with deadlines that did not correspond well to others in the permit. In the Final Permit, EPA has made several revisions to address these comments. For example, EPA changed a requirement that deficiencies in legal authority must be remedied "as soon as possible" to a 120-day requirement for deficiencies that can be addressed through regulation, and two years for deficiencies that require legislative action (Section 2.1.1). Also, EPA increased the compliance schedule for updating the District's stormwater regulation from twelve months to eighteen months, *id.,* so that this action could be adequately coordinated with the development of the District's new offsite mitigation/payment-in-lieu program (for more discussion see Section 4.1.3 below).

(2.2 Fiscal Resources): One commenter suggested eliminating the reference to the District's Enterprise Fund since funding was likely to come from a number of different budgets within the District. EPA agrees with this comment and has removed this reference.

On the other hand, many commenters noted that the implementation costs of the District's stormwater program will be significant. EPA agrees. The federal stormwater regulations identify the importance of adequate financial resources [40 C.F.R. §122.26(d)(1)(vi) and (d)(2)(vi)]. In addition, after seeing notable differences in the caliber of stormwater programs across the country, EPA recognizes that dedicated funding is critical for implementation of effective MS4 programs.[7,8,9] In 2009 the District established, and in 2010 revised, an impervious-based surface area fee for service to provide core funding to the stormwater program[10] (understanding that stormwater-related financing may still come from other sources as they fulfill multiple purposes, *e.g.,* street and public right-of-way retrofits). In conjunction with the 2010 rule-making to revise the fee the District issued a Frequently Asked Questions document[11] that indicates the intent to restrict this fee to its original purpose, *i.e.,* dedicated funding to implement the stormwater program and comply with MS4 permit requirements. EPA believes this action is essential, and he expects that the District will maintain a dedicated source of funding for the stormwater program.

State Water Resources Control Board

Issue Paper
Municipal Storm Water Permit Receiving Water Limitations
Board Workshop
November 20, 2012

ISSUE:

The State Water Resources Control Board (State Water Board) has been asked, in public comments received on National Pollutant Discharge Elimination System (NPDES) permits for Municipal Separate Storm Sewer Systems (MS4s), to adopt permit provisions that create a partial or complete exemption from enforcement for violations of water quality standards while a discharger engages in an iterative process of improving controls (commonly referred to as a "safe harbor" provision). The State Water Board has scheduled a public workshop to consider the issue.

DISCUSSION:

Background:

The Clean Water Act generally requires NPDES permits to include technology-based effluent limitations and any more stringent limitations necessary to meet water quality standards. In the context of NPDES permits for MS4s, however, the Clean Water Act does not reference the requirement to meet water quality standards. MS4 discharges must meet a technology-based standard of reducing pollutants in the discharge to the Maximum Extent Practicable (MEP), but requirements to meet water quality standards are at the discretion of the permitting agency.[1] Further, under the Porter-Cologne Water Quality Control Act, waste discharge requirements must implement applicable water quality control plans, including water quality objectives; however, the Porter-Cologne Act also affords the State Water Board and regional water quality control boards (collectively, Water Boards) flexibility to consider other factors, such as economics, when establishing any NPDES permit requirements that are more stringent than required by the Clean Water Act.[2]

The State Water Board has exercised its discretion with regard to requiring compliance with water quality standards in MS4 permits by directing, in precedential orders, that MS4 permits contain provisions requiring discharges to be controlled so as not to cause or contribute to exceedances of water quality standards in receiving waters.[3] However, consistent with federal

[3] SWRCB Order WQ 98-01 (*Environmental Health Coalition*), WQ 99-05 (*Environmental Health Coalition)*.

law, the State Water Board has found it appropriate to implement Best Management Practices (BMPs) in lieu of numeric water quality-based effluent limitations to meet water quality standards.[4] Additionally, in lieu of "strict compliance" with water quality standards, the State Water Board has prescribed an iterative process whereby an exceedance of a water quality standard triggers a process of BMP improvements: reporting of the violation, submission of a report describing proposed improvements to BMPs expected to better meet water quality standards, and implementation of these new BMPs.

While the Water Boards have generally directed dischargers to achieve compliance with water quality standards by improving control measures through the iterative process, the iterative process does not provide a "safe harbor" to MS4 permittees: that is, when a discharger is shown to be causing or contributing to an exceedance of water quality standards, that discharger is in violation of the relevant discharge prohibitions and receiving water limitations of the permit and potentially subject to enforcement by the Water Boards or through a citizen suit, even if the discharger is actively engaged in the iterative process. Despite the lack of a safe harbor provision, however, the Water Boards have, as a matter of practice, declined to initiate enforcement actions against MS4 permittees who have been actively engaged in the iterative process. The Water Boards' decisions to decline to include a safe harbor in MS4 permits have been upheld by courts of appeal.[5]

<u>*Need for and Purpose of Workshop:*</u>

The lack of a safe harbor in the iterative process was recently highlighted by the Ninth Circuit's decision in a citizen suit brought by the Natural Resources Defense Council (NRDC) against the County of Los Angeles and the Los Angeles County Flood Control District for violations of the receiving water limitations of their MS4 permit. The Ninth Circuit confirmed that, as the receiving water limitations of the Water Boards' MS4 permits are currently drafted, engagement in the iterative process does not excuse liability for violations of water quality standards.[6]

As the storm water management programs of municipalities have matured, an increasing body of monitoring data indicates that water quality standards are in fact not being met by many MS4s. MS4s accordingly assert that the receiving water limitations and iterative process provisions of the Water Boards' permits do not afford them with a viable path to compliance for these violations, which may take years of technical efforts to correct, especially for wet weather discharges. MS4s argue that they are increasingly vulnerable to citizen suits and/or Water Board enforcement. This concern has been raised by the California Stormwater Quality Association (CASQA) in comments on the proposed Phase II MS4 permit and by the California Department of Transportation (Caltrans) in comments on the Caltrans MS4 permit adopted

September 19, 2012, as well as by numerous MS4s and interested persons in comments on both permits. The issue is additionally relevant to the Phase I MS4 permits issued by the regional water quality control boards.[7]

At the same time, the environmental community has commented that the iterative process has been underutilized and ineffective to date in bringing MS4 discharges into compliance with water quality standards. Environmental parties argue that direct enforcement of water quality standards is necessary to protect water quality, especially in such second- or third-generation permits where dischargers have already had a number of years to come into compliance.

Because of the broad applicability of any policy decisions regarding the receiving water limitations and iterative process provisions, the State Water Board is holding a public workshop to consider several alternatives in addressing the issue and to seek public input on these alternatives. Following the workshop, the State Water Board may propose revisions to the receiving water limitations in the Caltrans MS4 and Phase II MS4 permits, and as necessary, re-open those permits after public review and comment, to make the revisions.

ALTERNATIVES FOR CONSIDERATION:

The State Water Board may consider the alternatives below, individually or in combination, to address concerns with the receiving water limitations in the Caltrans or Phase II MS4 permits. While the listed alternatives attempt to capture the range of alternatives before the State Water Board, the Board welcomes comments proposing other options and will not be limiting its consideration to the alternatives as listed in this issue paper.

The receiving water limitations language prescribed by State Water Board Order WQ 99-05 is attached as Attachment 1 and forms the basis of Alternative 1. CASQA has submitted specific proposed language for the Receiving Water Limitations provision of the proposed Phase II MS4 permit (CASQA Proposal). The CASQA Proposal is attached as Attachment 2 and is referenced as appropriate in the discussion of the alternatives below.

Alternative 1: Keep the status quo of no safe harbor.

This alternative makes no changes to the existing State Water Board approach or to the current language of the adopted Caltrans MS4 permit or the proposed Phase II MS4 permit. As stated previously, the current MS4 permit provisions laying out the iterative process are based on language set forth in precedential State Water Board orders. (See Attachment 1.) Alternative 1 adheres to the prescribed language. Under this alternative, the Water Boards may choose to exercise their enforcement discretion to refrain from taking action against dischargers engaged in good faith implementation of the iterative process; however, they would not be constrained from enforcing the receiving water limitations when an MS4 causes or contributes to exceedances of water quality standards. As a limitation within an NPDES permit, dischargers who cause or contribute to an exceedance of water quality standards could be subject to citizen suits.

[7] Note that the issue is not relevant to any other NPDES permits, including permits for storm water discharges associated with industrial activity, because all other NPDES permits must include technology-based effluent limitations and any more stringent limitations necessary to meet water quality standards. (33 U.S.C. § 1311(b)(1)(C).)

Alternative 2: No safe harbor, but provide greater clarity and specificity for iterative process implementation and wet weather data analysis.

Greater clarity and specificity in the MS4 permits as to the iterative process requirements may result in increased efforts to improve controls and achieve compliance. Such clarity and specificity may include:

1. Clarification on how compliance with the relevant discharge prohibitions and receiving water limitations is determined, including type and frequency of monitoring;
2. Clarification that dischargers must begin the iterative process after documentation of violations without waiting to be directed to do so by the Water Boards;
3. Specification of the minimum efforts that will constitute meaningful compliance with the iterative process;
4. Specification of the scope of any corrective action, including whether it applies only at the location where exceedances are measured or throughout the relevant watershed;
5. Specification of additional wet weather data analysis to better define and assess the impact of municipal storm water discharges on receiving waters, as well as the efficacy of specific best management practices.

As the MS4 program continues to mature and more data becomes available, this alternative may be enhanced by the development of water quality-based effluent limitations for pollutants, as appropriate, as a means of determining compliance with receiving water limitations. In addition, the enhanced wet weather data could be used to identify surrogates that could be used as a measure of protecting beneficial uses. In time, the data could be used to develop actual wet weather water quality standards or wet weather implementation provisions for existing water quality standards that could be applied consistently on a statewide basis.

Given the nature of storm water discharges and of MS4s, questions such as where and how compliance with water quality standards should be measured and how narrowly or broadly corrective actions should be applied, pose complicated technical issues that require careful study and consideration. These challenges notwithstanding, water quality improvements are more likely to be achieved as the iterative process becomes automatic and dischargers follow clear guidelines for determining and addressing non-compliance with permit terms. Such improvements may dissuade the Water Boards and the public from bringing enforcement actions/citizen suits for all except the most egregious and repeated violations.

In addition to being a stand-alone alternative, Alternative 2 may be considered in combination with Alternatives 3 through 5. The CASQA Proposal incorporates some greater specificity in the iterative process requirements as a component of its proposed receiving water limitations.

Alternative 3: Safe harbor that applies only if a discharger is in compliance with the implementation provisions of an approved TMDL.

Under Alternative 3, the receiving water limitations would be amended to provide a safe harbor for permittees that are in compliance with the implementation provisions of a TMDL. In effect, as long as the permittee is in compliance with the TMDL (including any compliance schedule) the terms of the TMDL would replace the requirement to comply with water quality standards for the pollutants that are covered by the TMDL.

The CASQA Proposal contemplates a safe harbor for dischargers in compliance with a TMDL as a component of the receiving water limitations.

Alternative 4: Safe harbor that applies if a discharger is in compliance with the implementation provisions of an approved TMDL, as in Alternative 3, and, in addition, that applies when the discharger engages in good faith compliance with the iterative process for exceedances caused by wet weather discharges.

In addition to the safe harbor for TMDL implementation, Alternative 4 would provide a safe harbor when dischargers engage in the iterative process in good faith to address violations of permit terms caused by wet weather discharges. Thus, if a storm water discharge from an MS4 is causing or contributing to an exceedance of a water quality standard in the receiving water, the exceedance would not constitute a violation of the permit as long as the discharger was engaged in good faith efforts to address the exceedance through improved controls. Alternative 4 recognizes that wet weather discharges from MS4s frequently cause or contribute to violations of water quality standards and allows the MS4s time to address these violations by improving control measures.

However, the safe harbor would not extend to dry weather discharges. Non-storm water discharges are generally prohibited in MS4 permits and only a few categories of non-storm water discharges are exempted from the prohibition, with the condition that these exempted discharges also be prohibited if they are identified as sources of pollutants to receiving waters.

Alternative 5: Full safe harbor.

This alternative would provide a full safe harbor to dischargers complying with the implementation provisions of a TMDL or engaging in the iterative process to address exceedances caused by wet or dry weather discharges.

The CASQA Proposal attached provides for a full safe harbor.

RIVERSIDE COUNTY FLOOD CONTROL
AND WATER CONSERVATION DISTRICT

November 13, 2012

Honorable Members of the State Water Resources Control Board
Attn: Ms. Jeanine Townsend, Clerk to the Board
State Water Resources Control Board
1001 I Street, 24th Floor
Sacramento, CA 95814

Dear Honorable Board Members and Ms. Townsend:

Re: Comment Letter – Receiving Water Limitations Language Workshop

I am writing on behalf of the Riverside County Flood Control and Water Conservation District ("District") regarding the State Water Resources Control Board's consideration of Receiving Water Limitations ("RWL") language in MS4 permits. This review was triggered by a decision of the Ninth Circuit United States Court of Appeals in *Natural Resources Defense Council v. County of Los Angeles* (9th Cir. 2011) 673 F.3d 880, *cert granted,* __ U.S. __ (June 25, 2012) ("*NRDC*"). This letter is being submitted in advance of the State Board's November 20, 2012 workshop on reform of the RWL language to be incorporated into MS4 permits as a matter of statewide policy.

The District is the Principal Permittee for <u>three</u> Phase I MS4 permits applicable to municipalities across Riverside County: Order R8-2010-0033, issued by the Santa Ana Regional Water Board to municipalities within the Santa Ana River Region of Riverside County; Order R9-2010-016, issued by the San Diego Regional Water Board to municipalities within the Santa Margarita Region of Riverside County; and Order R7-2008-0001, issued by the Colorado River Regional Water Board to municipalities within the Whitewater River Region of Riverside County. Given our unique perspective as the manager of three Phase 1 MS4 permits, the District and its staff thus, have considerable experience and expertise in developing and administering MS4 permits, and a keen understanding of the issues that the above mentioned court case creates.

The District strongly supports reform of the RWL language to make clear the State Board's often-expressed intention that MS4 Permittees' compliance with RWL be effectuated through an iterative process. However, under the Ninth Circuit's interpretation, any MS4 discharge that causes or contributes to an exceedance of a Water Quality Standard subjects the MS4 Permittee to civil penalty liability, injunctive relief and the payment of attorneys' fees in an action brought by a citizen plaintiff, even where the Permittee is fully implementing the programmatic requirements of their MS4 Permit.

The District supports the California Stormwater Quality Association's ("CASQA") efforts to obtain RWL language that ensures that the iterative process favored by the State Board is honored. The District also supports the comments of the California State Association of Counties, and believes the proposed RWL language attached to those comments is a step in the right direction.

This letter contains additional District comments about the RWL language and the iterative process. We believe that they are best expressed in terms of correcting misperceptions regarding the current RWL language, as interpreted by the Ninth Circuit.

Misperception Number One: Strict compliance with Water Quality Standards is required of MS4 Permittees by the Clean Water Act.

The Clean Water Act provides that MS4 discharges must control pollutants in discharges from the MS4 to the "Maximum Extent Practicable" (33 U.S.C. § 1342(p)(3)(B)(iii)). Unlike the case with other NPDES Permittees, the Clean Water Act does not require that municipalities strictly comply with Water Quality Standards, as determined by the Ninth Circuit in *Browner v. Defenders of Wildlife*. The State Board's own precedential Order WQ 2001-15 recognizes this fact and states that the RWL language was intended to be consistent with the *Browner* case. In that Order, which interpreted RWL language similar to that in *NRDC*, the Board stated:

> *[O]ur language, similar to the U.S. EPA's permit language discussed in the Browner case, does not require strict compliance with water quality standards. Our language requires that storm water management plans be designed to achieve compliance with water quality standards. Compliance is to be achieved over time, through an iterative approach requiring improved BMPs. As pointed out by the Browner court, there is nothing inconsistent between this approach and the determination that the Clean Water Act does not mandate strict compliance with water quality standards. [Order WQ 2001-15 at 7 (emphasis added)].*

Unfortunately, the Ninth Circuit completely disregarded this language, and the Order, in holding that strict compliance was required of MS4 Permittees.

USEPA itself has issued MS4 permits (in non-delegated states) that do not contain RWL language requiring strict compliance with Water Quality Standards. Therefore, it is clear that such compliance is not required by the Clean Water Act nor is such compliance established by USEPA policy. The most prominent example of a recent MS4 permit promulgated by USEPA is that for the District of Columbia ("DC Permit") (relevant portions of which are attached as Exhibit A), which was adopted in 2011.

Part 1.4 of the DC Permit contains the requirements relating to Water Quality Standards and provides, in relevant part: "Compliance with the performance standards and provisions contained in Parts 2 through 8 of the permit shall constitute adequate progress towards compliance with DCWQS [water quality standards] and WLAs [established under TMDLs] for this permit term." The DC Permit Fact Sheet explains the rationale for that language as follows [DC Permit Fact Sheet, Pages 5-6, emphasis added, attached as Exhibit B]:

> *Comments on the language in Part 1.4 varied widely. Some commenters did not believe it was reasonable to require discharges to meet water quality standards. Other commenters believed this to be an unambiguous requirement of the Clean Water Act.*

> *Today's Final Permit is premised upon* **EPA's longstanding view that the MS4 NPDES permit program is both an iterative and an adaptive management process for pollutant reduction and for achieving applicable water quality standard and/or total maximum daily load (TMDL) compliance.** *See generally, "National Pollutant Discharge Elimination System Permit Application Regulations for Stormwater Discharges," 55 F.R. 47990 (Nov. 16, 1990).*
>
> **EPA is aware that many Permittees, especially those in highly urbanized areas such as the District, likely will be unable to attain all applicable water quality standards within one or more MS4 permit cycles.** *Rather the attainment of applicable water quality standards* **as an incremental process** *is authorized under section 402(p)(3)(B)(iii) of the Clean Water Act, 33 U.S.C. § 1342(p)(3)(B)(iii), which requires an MS4 permit "to reduce the discharge of pollutants to the maximum extent practicable" (MEP) "and such other provisions" deemed appropriate to control pollutants in municipal stormwater discharges.* **To be clear, the goal of EPA's stormwater program is attainment of applicable water quality standards, but Congress expected that many municipal stormwater dischargers would need several permit cycles to achieve that goal.**
>
> *Specifically, the Agency expects that attainment of applicable water quality standards in waters to which the District's MS4 discharges, requires staged implementation and increasingly more stringent requirements over several permitting cycles. During each cycle, EPA will continue to review deliverables from the District to ensure that its activities constitute sufficient progress toward standards attainment. With each permit reissuance EPA will continue to increase stringency until such time as standards are met in all receiving waters.* **Therefore today's Final Permit is clear that attainment of applicable water quality standards and consistency with the assumptions and requirements of any applicable WLA are requirements of the Permit, but, given the iterative nature of this requirement under CWA Section 402(p)(3)(B)(iii), the Final Permit is also clear that "compliance with all performance standards and provisions contained in the Final Permit shall constitute adequate progress toward compliance with DCWQS and WLAs for this permit term" (Section 1.4).**

USEPA is now proposing clarifying changes to this language and to other sections of the DC Permit as the result of a settlement with various parties. However, those changes do not require strict compliance with Water Quality Standards, but rather compliance through the programs developed under the Permit.

The State Board is thus, free to adopt new RWL language that effectuates its previously expressed intent that MS4 permits not require strict compliance with Water Quality Standards with regard to contributions from discharges from MS4s.

Misperception Number Two: The MS4 Permittees are Seeking a "Safe Harbor" that would Insulate them from Responsibility Under the Clean Water Act.

While State Board staff's "Issue Paper" uses the term "safe harbor" in describing the iterative process, the District believes that this is fundamentally misleading. Even a cursory review of the terms of a typical MS4 permit in California reveals that it is full of compliance points. In the three MS4 Permits in which the District serves as Principal Permittee, literally every sentence is a separate point of compliance.

This fact is supported by the language of the Permits themselves. For example, in Order R8-2010-0033 Part XX.G provides: **"The Permittees must comply with all terms, requirements, and conditions of this Order. Any violation of this Order constitutes a violation of the CWA, its regulations and the California Water Code, and is grounds for enforcement action . . . ."** (emphasis added). Similar provisions are contained in the other two Riverside County MS4 Permits. Even without the strict Water Quality Standard language imposed under the Ninth Circuit's opinion, there is no "safe harbor" from liability under the Clean Water Act or, where applicable, the California Water Code, for any Permittee that fails to fully implement each the detailed and prescriptive requirements of its MS4 Permit.

There is a fundamental difference however, between fully complying with activities within the control and responsibility of the Permittees, such as monitoring, implementing BMPs and performing other programmatic requirements of the MS4 Permit; and being forced to guarantee that MS4 discharges will not cause or contribute to exceedances of Water Quality Standards in Receiving Waters, a guarantee that the Permittees' have no ability to make.

What the District and other MS4 Permittees seek is relief from what is essentially "guaranteed non-compliance" where a Permittee can be found in violation of their MS4 Permit even if the exceedance occurs at no fault of or failure by the Permittee, or put another way, even in circumstances where there is nothing a Permittee could have done to prevent that exceedance from occurring. In such a case, the Permittee can be held liable for potentially millions of dollars in legal costs, penalties and other expenses. We note that the City of Malibu, a city of only 13,000 residents, spent more than $2 million in defending against a citizen suit filed with respect to its MS4 Permit and more than $6 million to settle the case, including payment of $750,000 in attorney fees to plaintiffs. Given the tremendous financial challenges faced by every California municipality, including the District, the County of Riverside and the Permittee cities within the County, such a diversion of resources that otherwise would be directed at clean water programs or other vital municipal programs is a poor policy choice. And, as noted, it is not a policy choice that is required by the Clean Water Act, nor is it required by USEPA in their own Permits.

The District recognizes that regulatory enforcement actions and citizen suits are authorized by the Clean Water Act and that such suits may be an appropriate remedy where, for example, a Permittee has failed to comply with the programmatic requirements of its MS4 Permit. Where, however, the Permittees are complying with those requirements in good faith but, due to circumstances beyond their control, their MS4 discharge causes or contributes to a Water Quality Standard exceedance in Receiving Waters, a citizen suit based on those exceedances potentially throws away the work done by the Permittees and the Water Boards under the MS4 Permit, as discussed below.

Misperception Number Three: MS4 can achieve compliance with strict Water Quality Standards.

MS4 Permittees cannot guarantee that discharges from their MS4s will in fact, not cause or contribute to an exceedance of Water Quality Standards in a Receiving Water. The monitoring conducted under our MS4 Permits reflects exceedances of various Water Quality Standards in Receiving Waters, and we understand that such results are typical for MS4 discharges around the state (please see Pages 2-3 of the CASQA comment letter dated November 2, 2012). The extreme variability of stormwater quality and quantity itself (which, in Southern California, arrives infrequently and from widely varying storm sizes) combined with a multitude of potential pollutant sources beyond a Permittee's ability to truly "control", make it impossible for a municipality to ensure that no discharges from its MS4 will ever cause or contribute to exceedances of Water Quality Standards in Receiving Waters. This was recognized by the Issue Paper released by State Board staff in preparation for the November 20th workshop, which found that as "the storm water management programs of municipalities have matured, **an increasing body of monitoring data indicates that water quality standards are in fact not being met by many MS4s**" (Issue Paper, Page 2 (emphasis supplied)).

Thus, even if municipal Permittees are to be held strictly liable for the ensuring that no discharges from their MS4s cause or contribute to an exceedance of Water Quality Standards, as the Ninth Circuit has interpreted the current RWL language, those Permittees have no ability to attain those standards. The reasons are several-fold and include the following:

1) Unlike an industrial NPDES Permittee, a municipal Permittee is not typically the source of the pollutants in the MS4 discharge (whether wet or dry). The municipality can regulate sources to some degree (through, for example, the operation of structural and non-structural BMPs and implementation of an Illegal Connection/Illicit Discharge program), but the municipality cannot guarantee that pollutants will not enter the MS4 and then be discharged into the Receiving Waters.

2) Municipalities cannot control natural sources of pollutants that are discharged through the MS4. Monitoring has indicated that many pollutants are likely from natural and not anthropogenic sources.

3) While Permittees conduct extensive public education programs as part of their MS4 programs, municipalities cannot "control" human behavior, or "prevent" an individual from taking an action that might cause pollution to enter the MS4. As an example, a resident may, despite all ordinances, regulations, potential penalties or enforcement, public outreach, available BMPs, etc., choose not to pick up after their pets, and

stormwater may, through no fault of the Permittee, pick up animal waste and deposit into the MS4.

4) MS4 Permittees cannot "prevent" flows from entering their MS4. To protect the health and property of their residents, MS4 operators must allow the legitimate flows of water into their drains. This is especially true for the District, which is charged directly by the Legislature [in Water Code App. §48-9] with the task of taking necessary steps to protect the people, properties and watersheds of Riverside County from the negative impacts of flooding. The District cannot, in effect, cause flooding by preventing flows from entering their storm drain, simply because such flows may contain pollutants that cause a violation of the Receiving Waters Limitation provisions of their MS4 Permits. In fact, California law requires downstream property owners (such as MS4 operators) to accept flows from upstream property owners.

5) Further, the authorities granted to flood control districts, such as this District, by the Legislature are narrow and do not include the authority to condition or regulate the quality or nature of stormwater runoff discharged from up gradient properties. This responsibility is appropriately assigned by the Legislature to the Regional Boards.

Similarly, MS4 Permittees cannot guarantee compliance with Water Quality Standards in dry weather. "Alternative 4" in the staff's Issue Paper suggests an alternative RWL approach that would not extend the iterative approach to dry weather discharges. The District submits that this alternative does not reflect the reality of urban runoff. Monitoring conducted under the Riverside County MS4 Permits reflects exceedances of Water Quality Standards during dry weather as well as wet weather. There is no justification for imposition of strict liability for exceedances during such conditions, for the following reasons:

1) During dry weather, other NPDES-permitted discharges continue to flow into the Receiving Waters. For example, much of the flow in the Santa Ana River during dry weather conditions is from non-MS4 sources, such as publicly owned treatment works. Additionally, numerous other separate NPDES-permitted discharges will occur, potentially at concentrations of pollutants that exceed Water Quality Standards. Evidence generated during the *NRDC* case involving the County of Los Angeles, for example, indicated that NPDES permits covering hundreds of these dischargers, including POTWs allowed the discharge of pollutants at concentrations *greater* than Water Quality Standards. Because of these discharges, which are legal and authorized by the Regional Boards, the MS4 Permittees have essentially no more control over compliance with Water Quality Standards in dry weather than they would have during wet weather conditions.

2) Accidental or even intentional illicit discharges by third parties into the MS4 obviously can occur during dry weather as well as wet weather. Such discharges would potentially have an even greater impact on sampling, since they are not diluted by large volumes of stormwater. For example, a vehicular accident recently caused hundreds of gallons of

asphalt tar to enter Sandia Creek, a Receiving Water in Riverside County. While this spill was not discharged through an MS4, if the vehicular accident had occurred in another portion of the watershed, the spill could feasibly have entered into and been discharged from an MS4. Similarly in many places throughout the State, sanitary sewer systems are owned and operated by special districts that have no relation to the MS4 Permittees that own or operate the MS4 systems. Nevertheless, an overflow of such sanitary sewer systems may cause an unavoidable discharge into, and from a Permittee-owned MS4. Such accidental or illicit discharges cannot be "prevented" or "controlled" by the Permittees except to the extent that they can be cleaned up or blocked if promptly reported. However, if the discharge has reached Receiving Waters and caused a measured exceedance of Water Quality Standards, under the Ninth Circuit's interpretation, liability for civil penalties, injunctive relief and attorneys fees will attach to the MS4 Permittee.

3) Enforcing strict Water Quality Standard limits in dry or wet weather is counter-productive to the watershed planning-based MS4 Permits currently being promulgated by many regional water boards. Enforcing such limits will divert Permittee attention and resources from watershed-based, monitoring-heavy compliance programs, as will be discussed in greater detail below.

In essence, under the Ninth Circuit's interpretation of the current RWL language, the District, and potentially every other MS4 Permittee in the state, is in violation of its Permit any time that an exceedance of a Water Quality Standard is recorded and attributed to a discharge from its MS4. This means that the Regional Water Boards have issued, and continue to adopt permits that include RWL language **which cannot be complied with**. The Clean Water Act, however, does not require Permittees to achieve the impossible. *See, e.g., Hughey v. JMS Development Corp.* (11th Cir. 1996) 78 F.3d 1523, 1530 ("In interpreting the liability provisions of the CWA, we realize that Congress is presumed not to have intended absurd (impossible) results.").

Misperception Number Four: The Current RWL Language is more Protective of Receiving Water Quality.

This statement is not only untrue but maintaining the current RWL language actually **impedes** efforts to protect Receiving Water Quality.

We understand that some stakeholders believe that there should be Numeric Effluent Limitations (NELs) contained in the MS4 Permits for purposes of accountability. In response, we note that many MS4 permits now contain numeric Stormwater and Non-stormwater Action Levels ("SALs" and "NALs") or other numeric targets or goals, the exceedance of which trigger specific compliance responses by the Permittees. It is these action levels (which were advocated by the Blue Ribbon Panel established by the State Board to investigate the appropriateness of NELs in MS4 permits) which provide such "numeric" accountability. This is in addition to the numerous other compliance documentation and reporting provisions required of MS4 Permittees that also provide measures of accountability.

More importantly, the current RWL language as interpreted by the Ninth Circuit actually impedes efforts by municipalities to protect water quality. First, by requiring immediate compliance, the language undermines efforts to bring Water Quality Standard-impaired waterbodies into compliance through the Total Maximum Daily Load ("TMDL") program. TMDLs are designed with the recognition that, due to the complexity of the issues causing the waterbody to be impaired in the first place, meeting these requirements cannot be achieved immediately. Therefore, TMDL compliance plans include timelines to achieve such compliance over periods of years and sometimes decades.

Second, most MS4 permits have begun incorporating sophisticated watershed management plans, which prioritize pollutants by waterbody and attempt, through aggressive monitoring and source identification efforts, to identify and address the sources of those prioritized pollutants. Municipalities subject to strict RWL language will have no ability to prioritize pollutants, since they must address any pollutant that exceeds a Water Quality Standard, irrespective of the relative impact that that discharge may have had upon the environment or beneficial uses. Moreover, these watershed management plan approaches employ cooperative monitoring and other watershed-based approaches. Permittees faced with potential liability for any exceedance of Water Quality Standards in Receiving Waters that may be caused or contributed to by discharges of their MS4s, will not likely volunteer to cooperate on any watershed-based approach, if cooperation could subject them to additional unnecessary liability.

Third, in a citizen suit brought under the Clean Water Act, a federal judge is free to impose any appropriate injunctive relief to enforce a permit (33 U.S.C. § 1365(a)). Thus, for example, a court could ignore the provisions of a MS4 permit in ordering municipal defendants to address Water Quality Standard exceedances in Receiving Water. This means that the thousands of people-hours invested in the Permit's development, implementation and oversight by municipalities, the Regional Water Boards and other stakeholders would be wasted. In essence, under the Ninth Circuit's reading of the RWL language, all other language in an MS4 permit appears to be superfluous, since the RWL language would control all compliance efforts. This result, of course, is not required by plain language of the Clean Water Act.

Fourth, if a municipality is in unavoidable and automatic non-compliance with the requirements of its MS4 Permit, it will be unable to justify budgeting for water quality management programs and BMPs otherwise required by the Permit as the municipality will simply receive no benefit from making compliance investments. To gain public support for stormwater programs, a municipality must demonstrate to its residents that such investments will constitute compliance with the Permit.

Discussion of Alternatives

The State Board staff's Issue Paper sets forth five alternatives for consideration. Alternative 1, no change in the current RWL language, is completely unacceptable to the District (and, we believe, to other municipalities across the state) because it fails to address the "guaranteed non-compliance" problem of the current language.

Alternative 2, which proposes to maintain the language that puts the MS4 Permittees in a situation of unavoidable and potentially "guaranteed" non-compliance, but would add greater specification as to how the iterative process might be carried out, is also unacceptable as the MS4 Permittees will still have no viable means to ensure their compliance with the RWL language. While the District does not object in principle to RWL language that spells out clearly, and in achievable terms, what is required of MS4 Permittees when exceedances are recorded, such a change alone does not address the fundamental issues identified in this letter.

Alternative 3, which proposes to provide an iterative process for compliance with the RWL only for pollutants being addressed by dischargers in compliance with an approved TMDL, is better than the first two alternatives, but is still entirely insufficient. By failing to provide a viable means for compliance with the RWL language for non-TMDL pollutants, this alternative language would force Permittees into unavoidable non-compliance, and require them to redirect their efforts and resources away from the TMDL activities, to those other pollutants, due to the strict liability attached to those exceedances. This would be a poor policy choice, as pollutants that are not subject to a TMDL may have significantly less, or even no impact on beneficial uses in the Receiving Waters, as noted in the CASQA comment letter.

Alternative 4, which excludes dry weather discharges from the iterative process to comply with the RWL, is unacceptable for the reasons previously set forth regarding an MS4 Permittees inability to truly "prevent" or "control" accidental or illegal dry weather discharges.

Alternative 5, which provides viable means for compliance with the RWL, for all types of MS4 discharges, is the only viable solution among the alternatives presented by State Board staff. In an era of limited budgets, the only and best way to make progress toward improving the quality our Receiving Waters, is to provide MS4 Permittees the ability to prioritize their efforts, as required in the Watershed Management Plan provisions contained in the most recent MS4 Permits, including the Los Angeles County Permit and the proposed Regional Permit for the San Diego Regional Water Board. As previously discussed, such prioritization cannot occur in the context of strict liability for the exceedance of Water Quality Standards in the Receiving Waters. For all of the reasons set forth in this letter, no other alternative makes policy sense or is congruent with the Maximum Extent Practicable standard in the Clean Water Act.

The District would add that Alternative 5 should additionally incorporate the concept of achieving RWL compliance through watershed management plans, and requests the Board to direct staff to work with stakeholders to ensure that any revised RWL language does not force intermittent or minor exceedances of Water Quality Standards to become de-facto higher priorities than those set by the watershed stakeholders.

In summary, the District supports CASQA, the California State Association of Counties and other municipal stakeholders in advocating for a fully iterative and viable approach to compliance with RWL language in both wet and dry weather conditions. Only when such an approach is in place and endorsed by the State Board will Permittees, including the District, feel confident that they can focus fully on efforts to address pollutants in discharges into and from their MS4s, and not on preparing for costly and pointless litigation.

The District therefore, respectfully requests the State Board direct its staff to commence development of new language providing for an enforceable, iterative and viable process for MS4 Permittees to comply with the RWL language included in MS4 permits.

We wish to thank you and State Board staff for your consideration of these comments and any further comments, written or oral, that the District may make on these important issues.

Very truly yours,

Steve Thomas

EXHIBIT D

IN THE UNITED STATES DISTRICT COURT
FOR THE EASTERN DISTRICT OF VIRGINIA
Alexandria Division

VIRGINIA DEPARTMENT OF TRANSPORTATION, ET AL, Plaintiffs, -v- UNITED STATES ENVIRONMENTAL PROTECTION AGENCY, ET AL, Defendants.	Civil Action No. 1:12-CV-775

Memorandum Opinion

Before the Court is the Plaintiffs' motion for judgment on the pleadings under Federal Rule of Civil Procedure 12(c). The Defendants opposed the motion, and the Plaintiffs replied. The Court heard oral arguments on December 14, 2012 and now issues this memorandum opinion and accompanying order granting the Plaintiffs' motion.

Background

The Clean Water Act, 33 U.S.C. § 1251 et seq., establishes the basic structure for regulating discharge of pollutants into the waters of the United States, and provides certain mechanisms to improve and maintain the quality of surface waters.

One such mechanism is the requirement that states identify "designated uses" for each body of water within their borders, as well as "water quality criteria" sufficient to support those uses. 33 U.S.C. § 1313(c)(2)(A). The Environmental Protection Agency ("EPA") evaluates the uses and criteria developed by the states, and either approves them or else proposes and promulgates its own set of standards. § 1313(c)(3).

Once the standards are in place, each state is required to maintain a list—also subject to approval or modification by EPA—of its waterbodies that are "impaired" because they do not meet their respective water quality criteria. 33 U.S.C. § 1313(d)(1)(A). For each waterbody on the impaired list, the state is required to establish a set of total maximum daily loads ("TMDLs") sufficient to bring the body back into compliance with its water quality criteria. § 1313(d)(1)(C). Each TMDL establishes the maximum amount of a pollutant that may be added to the waterbody daily from all sources (runoff, point sources, etc.). EPA is required to publish a list of pollutants suitable for maximum daily load measurement, § 1314(a)(2)(D), and it has determined that *all* pollutants are suitable for TMDLs, *see* Total Maximum Daily Loads Under Clean Water Act, 43 Fed. Reg. 60,662. Therefore, any pollutant that falls within the relatively broad definition of "pollutant" set forth in § 1362(6) may be regulated via TMDL. EPA can approve or modify as it sees fit TMDLs proposed by the states. § 1313(d)(2).

Here the state in question is Virginia, and the waterbody is a 25-mile long tributary of the Potomac River, located in Fairfax County, called Accotink Creek. The creek has been the subject of litigation in the past that is not relevant to this matter except the result: EPA was required to set TMDLs for Accotink Creek once Virginia failed to do so by a certain date. Specifically, the creek had been identified as having "benthic impairments," which is to say the community of organisms that live on or near the bottom of the creek were not as numerous or healthy as they should be. EPA was to set appropriate TMDLs to improve the health of the benthic community in Accotink Creek.

On April 18, 2011, EPA established a TMDL for Accotink Creek which limited the flow rate of stormwater into Accotink Creek to 681.8 ft^3/acre-day. The TMDL was designed to regulate the amount of sediment in the Accotink, because EPA believed sediment was a primary cause of the benthic impairment. Both parties agree that sediment is a pollutant, and that stormwater is not. EPA refers to stormwater flow rate as a "surrogate" for sediment.

The Plaintiffs are now challenging the TMDL on multiple grounds, but presently before the Court is a single issue: Does the Clean Water Act authorize the EPA to regulate the level of a pollutant in Accotink Creek by establishing a TMDL for the flow of a nonpollutant into the creek?

Analysis

I. Standard of Review

Count I of the complaint, at issue here, is brought under the Administrative Procedures Act. *See* Comp. ¶ 169. The APA "confines judicial review of executive branch decisions to the administrative record of proceedings before the pertinent agency." *Shipbuilders Council of Am. V. U.S. Dept. of Homeland Sec.*, 770 F. Supp. 2d 793, 802 (E.D. Va. 2011). As such, the district court "sits as an appellate tribunal," and APA claims can be resolved equally well in the context of Rule 12 or Rule 56. *Univ. Med. Ctr. Of S. Nev. V. Shalala*, 173 F.3d 438, 441 n. 3 (D.C. Cir. 1999).

Because Count I presents a question of statutory interpretation, the Court reviews EPA's decision using the two-step analysis set forth in *Chevron, U.S.A., Inc. v. NRDC, Inc.*, 467 U.S. 837 (1984). For a given question of statutory interpretation, the first step under *Chevron* is to determine whether Congress addressed the "precise question at issue." 467 U.S. at 842. "If the intent of Congress is clear, that is the end of the matter . . . ." *Id.* If the Court cannot find that Congress has squarely addressed the question, the Court must move to Chevron's second step. In the second step of statutory construction under *Chevron*, the Court must determine whether the agency's interpretation of the statute is "permissible." *Id.* at 843. The agency's construction is permissible if it is reasonable, but it need not be what the Court considers the *best* or *most reasonable* construction. *See id.* at 845. The Court is not to simply impose its own construction on the statute, but instead it gives deference to any reasonable statutory construction by the agency. *Id.* at 843.

II. Chevron Step One

Whether statutory ambiguity exists so that the issue cannot be settled at *Chevron's* first step is for the Court to decide, and the Court "owe[s] the agency no deference on the existence of ambiguity." *Am. Bar Ass'n v. FTC*, 430 F.3d 457, 468 (D.C. Cir. 2005). The Court begins the inquiry by "employing traditional tools of statutory construction." *Chevron*, 467 U.S. at 843 n.9. As always, the analysis begins with the text of the statute. *Nat'l Elec. Mfrs. Ass'n v. U.S. Dept't of Energy*, 654 F.3d 496, 504 (4th Cir. 2011).

The text of the statute that requires states to establish their own TMDLs, 33 U.S.C. § 1313(d)(1)(C), is:

> Each State shall establish for the waters identified in paragraph (1)(A) of this subsection, and in accordance with the priority ranking, **the total maximum daily load, for those pollutants which the Administrator identifies** under section 1314(a)(2) of this title as suitable for such calculation. Such load shall be established at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality. (emphasis added)

The next subsection, § 1313(d)(2), grants EPA the authority to set TMDLs when the state has not done so adequately. "Pollutant" is a statutorily defined term. 33 U.S.C. § 1362(6).

The Court sees no ambiguity in the wording of this statute. EPA is charged with establishing TMDLs for the appropriate pollutants; that does not give them authority to regulate nonpollutants. The parties agree that sediment is a pollutant under 33 U.S.C. § 1362(6), and stormwater is not. Then how does EPA claim jurisdiction over setting TMDLs for stormwater?

EPA frames the stormwater TMDL as a surrogate. EPA's research apparently indicates that the "[sediment] load in Accotink Creek is a function of the amount of stormwater runoff generated within the watershed." Def. Opp. at 8. And EPA believes that framing the TMDL in terms of stormwater flow rate is superior to simply expressing it in terms of maximum sediment load.

The DC Circuit has considered and rejected a similar attempt by EPA to take liberties with the way Congress intended it to express its TMDLs. In *Friends of the Earth, Inc. v. Env. Protection Agency*, EPA had promulgated TMDLs for the Anacostia River that expressed the maximum load of certain pollutants in terms of annual and seasonal amounts. 446 F.3d 140, 143 (D.C. Cir. 2006). The court found that expressing a TMDL in terms of annual or seasonal maximums was not allowed, because the statute granted authority only for daily loads. *Id.* at 148. The court reached its conclusion even though EPA apparently made a strong argument that expressing TMDLs in terms of annual or seasonal loads was an effective and reasonable approach. *See id.* Presumably a daily load could have been derived by simply dividing the annual load by 365, yet the court still required expression in the terms dictated by Congress.

Here too, EPA hopes to express a TMDL in terms other than those contemplated by the statute, arguing that such an expression is the most effective method. But, as *Friends of the Earth* illustrates, EPA may not regulate something over which it has no statutorily granted power—

annual loads or nonpollutants—as a proxy for something over which it *is* granted power—daily loads or pollutants.

EPA's argument that its surrogate approach should be allowed because the statute does not specifically forbid it fails. EPA is not explicitly forbidden from establishing total maximum *annual* loads any more than they are explicitly barred from establishing TMDLs for nonpollutants. The question is whether the statute grants the agency the authority it is claiming, not whether the statute explicitly withholds that authority. And in this case, as in *Friends of the Earth*, the statute simply does not grant EPA the authority it claims.

The dicta in *Weyerhaeuser Co. v. Costle* is not as helpful to EPA's case as it would like. 590 F.2d 1011, 1022 n.6 (D.C. Cir. 1978). It is true that the court said in a footnote "[i]t is well recognized that EPA can use pollution parameters that are not harmful in themselves, but act as indicators of harm." *Id.* But in that case, the non-harmful pollution parameters the EPA sought to regulate were components of the effluent commonly discharged from paper mills, *id.* at 1022, making them effluents themselves. And power to regulate effluents is expressly granted to the EPA in the relevant statutory section. *See* 33 U.S.C. § 1314(b).

EPA would like to create the impression that Congress has given it loose rein to determine exactly what it could and could not regulate. On page 16 of its opposition to this motion, EPA points out that "Congress authorized EPA to determine which pollutants were suitable for TMDL calculation and measurement." (Internal quotes removed). While this may be true, EPA glosses over the fact that 33 U.S.C. § 1314(a)(2)(D) only gives EPA the power to regulate pollutants as that term is defined—by Congress—elsewhere in the statute. And, as discussed above, sediment is a pollutant for these purposes, but stormwater is not.

In a similar vein, EPA regulations which imply that the agency has discretion to set the

TMDL as it sees fit do not bear on the question now before the Court. EPA has promulgated a regulation allowing TMDLs to be "expressed in terms of either mass per time, toxicity, or other appropriate measure," 40 C.F.R. § 130.2(i), and another that allows TMDLs to be expressed as a "property of pollution," 50 Fed. Reg. 1774, 1776 (Jan. 11, 1985). But, EPA citing these regulations to demonstrate that the surrogate TMDL approach is permissible is mere bootstrapping. To the extent the regulations allow EPA to set TMDLs for nonpollutants, they exceed the statutory authority of EPA.

The plain language of the statute trumps all, but legislative history also supports Plaintiffs' argument. Congress's intent to limit EPA's discretion in this context is evidenced by the committee record cited by Plaintiffs, which has also been used by the Ninth Circuit, in which Senator Randolph, Chairman of the Senate committee that amended the act in 1972, explained, "We have written into law precise standards and definite guidelines on how the environment should be protected. We have done more than just provide broad directives [for] administrators to follow." Pl. Mot. 7, *citing Nw. Envtl. Def. Ctr. v. Brown*, 640 F.3d 1063, 1072 (9th Cir. 2011). Congress created a statutory scheme that included a precise definition of the word "pollutant," and then gave EPA authority to set TMDLs for those pollutants. Senator Randolph's comments strongly imply that Congress did not intend anything more or less than what is written in the statute.

The Court considers the language of 33 U.S.C. § 1313(d)(1)(C) to be unambiguous. Congress has spoken directly on the question at issue, and its answer is that EPA's authority does not extend to establishing TMDLs for nonpollutants as surrogates for pollutants. The legislative history of the CWA is consistent with this reading. Therefore, this Court finds EPA's interpretation of § 1313 and the related provisions to be impermissibly broad based on analysis under the first step of *Chevron* analysis.

III. Chevron Step Two

Because the Court considers Congress's intent to be clear and unambiguously expressed by the language of the statute, it need not move to the second step of *Chevron* analysis. But the Court notes that there is substantial reason to believe EPA's motives go beyond "permissible gap-filling."

Page 9 of EPA's opposition says, "stormwater flow rates as a surrogate would more effectively address the process by which sediment impairs aquatic life in Accontink Creek." If the sediment levels in Accotink Creek have become dangerously high, what better way to address the problem than by limiting the amount of sediment permitted in the creek? If sediment level is truly "a function of" the amount of stormwater runoff, as EPA claims, then the TMDL could just as easily be expressed in terms of sediment load.

In fact, the Board of Supervisors of Fairfax County argued at the December 14th hearing (without objection from EPA) that EPA has approved 3,700 TMDLs for sediment nationwide, and in Virginia has addressed 111 benthic impairments with TMDLs. None of them regulated the flow rate of stormwater. By comparison, EPA has tried out its novel approach of regulating sediment via flow in only four instances nationwide, and all four attempts were challenged in court. One has settled, the other three are still pending.

The Court suspects that the decision to regulate stormwater flow as a surrogate for sediment load would not constitute a permissible construction of § 1313(d)(1)(C), even given the deference due at *Chevron's* second step. This is especially likely because EPA is attempting to increase the extent of its own authority via flow TMDLs, which courts must examine carefully.

See Brown & Williamson Tobacco Corp. v. Food & Drug Admin., 153 F.3d 155, 161-62 (4th Cir. 1998). EPA's attempt to set TMDLs for nonpollutants probably goes beyond "permissible gap-filling" and is instead an impermissible construction of the statute.

Conclusion

The language of § 1313(d)(1)(C) is clear. EPA is authorized to set TMDLs to regulate pollutants, and pollutants are carefully defined. Stormwater runoff is not a pollutant, so EPA is not authorized to regulate it via TMDL. Claiming that the stormwater maximum load is a surrogate for sediment, which is a pollutant and therefore regulable, does not bring stormwater within the ambit of EPA's TMDL authority. Whatever reason EPA has for thinking that a stormwater flow rate TMDL is a better way of limiting sediment load than a sediment load TMDL, EPA cannot be allowed to exceed its clearly limited statutory authority. For these reasons, the Plaintiffs' motion for Rule 12(c) judgment on the pleadings on Count I of their complaint is granted.

South County Economic Development Council

SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD
2013 JAN 11 A 10:55

January 10, 2013

Mr. Wayne Chiu, P.E.
California Regional Water Quality Control Board, San Diego Region
9174 Sky Park Ct Ste 100
San Diego, CA 92123-4340

Dear Mr. Chiu,

On January 8, 2013, The South County Economic Development Council (SCEDC) Board of Directors agreed to send you a letter voicing our concerns with the changes proposed to the Regional Water Quality Board's Stormwater permit. While our members noted the intent of the ordinance is admirable, the anticipated implementing of the ordinance was viewed as onerous and expensive and a detriment to economic development in South San Diego County.

The draft language of the permit includes new requirements for development. These new requirements will increase costs substantially on an already over-burdened business community. These costs are due to the measures that must be taken to comply with the new regulations. Additionally, the new liability for exceeding the water quality objectives will discourage investment in our region at a time when we should encourage businesses to invest and create more jobs. Furthermore, it was noted that many of the previous exemptions to the Stormwater regulations had been deleted in this new ordinance. The additional measures needed to comply with these regulations will make a project infeasible.

SCEDC would like to offer our services if the San Diego Regional Water Quality Control Board would like to create an implementation task force to discuss best practices and realistic methods to achieve your goals. If I may be of further assistance or provide additional information please feel free to contact me at (619)424-5143.

Sincerely,

Cindy Gompper Graves

Re: SDASLA COMMENTS ON THE DRAFT REGIONAL MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) (Tentative Order No. R9-2013-0001)/(NPDS Case No. CAS0109266)

Dear Mr. Chiu:

The American Society of Landscape Architects (ASLA) continues to advocate across the country for economic recovery, sustainable design, quality of life issues and wise use of our natural resources including clean water. The San Diego Chapter of the American Society of Landscape Architects (SDASLA) is fully committed to these principals and respectfully submits the following comments, observations and recommendations to the draft San Diego Regional Municipal Separate Storm Sewer System at the request of the Regional Board.

The SDASLA fully supports the proposed approach to the permit that includes:

- Regional Permit / Holistic Approach
- Includes Strategic Planning
- Adaptive / Results Based Management
- Alternative Compliance / Mitigation
- Water Quality Improvement Plans (WQIP)

SDASLA understands that the proposed WQIPs in the draft permit will become powerful tools to help improve water quality within each of our ten watersheds and strongly recommends the following be added to the permit:

- Timely development of effective and enforceable WQIP(s).
- Each WQIP be developed through a process that ensures public participation such as the formation of a stakeholders advisory group.
- Stakeholder advisory groups for each watershed shall include representatives of environmental groups, business groups, community planning and /or sponsor groups, local universities and technical experts with knowledge of the watershed.
- This stakeholder advisory group should work closely with the Copermittees and a regional board staff member while the Water Quality Improvement Plans are being developed to ensure these plans aggressively pursue water quality gains.
- The stakeholder advisory process should include accountability and measureable milestones to ensure the goals of the Permit are being met.
- Appropriate BMP's should be determined for each watershed and should be reviewed by a project engineer and / or Landscape Architect to determine if they are infeasible.

April 10 and 11, 2013
Item No. 8
Supporting Document No. 5

- If project BMP's are determined to be infeasible than no other burden of proof should be required.
- To sections 3.b.(3)(c) Priority Development Exemptions (Page 77), and 3.c.(b) Alternative Compliance Project Options (Page 81), add the following option:
    - Designed and constructed to be certified under the Sustainable Sites Initiative (SITES™), a voluntary certification program through the American Society of Landscape Architects, the Lady Bird Johnson Wildflower Center at The University of Texas at Austin and the United States Botanic Garden, receiving at least credits 3.5 and 3.6. under the "Site Design - Water" category.

SDASLA supports the use of Low Impact Development (LID) BMP Requirements strategies when geologically appropriate and feasible. However, other options should be available to strengthen overall water quality such as in-lieu fees, mitigation and redevelopment of key sites to encourage smart growth and urban infill / redevelopment in the future. SDASLA encourages the required development of a priority site list by each Copermittee during the planning process for which in-lieu fees / mitigation may be applied. These sites could function as large water holding and infiltration sites and double as public open space / educational areas. However, SDASLA is concerned that not all BMPs will be effective or feasible throughout the basin. SDASLA recommends that the Copermittees be allowed to customize the application of specific BMPs on a watershed by watershed basis through the development of robust and enforceable Water Quality Improvement Plans rather than imposing a universal suite of BMPs on all watersheds regardless of their feasibility of applicability.

By taking advantage of the knowledge and resources of diverse stakeholders like municipalities, businesses and residents, environmental groups, technical experts and the academia, our region can benefit greatly from solutions that provide cleaner water more efficiently, quickly and cost effectively creating healthier communities. But this can only be achieved if these stakeholders are involved in a meaningful way during the Water Quality Improvement Plan development process.

SDASLA recognizes the challenge this permit and the proposed changes represents to our region, and would like to help by participating in the Water Quality Improvement Plan development process. SDASLA urges the Regional Board to enhance the stakeholder participation opportunities during Water Quality Improvement Plan development before approving the final permit.

Thank you for your consideration and we look forward to continuing our work with you and your staff on this draft permit.

Sincerely yours in Landscape Architecture,

San Diego Regional Water Quality Control Board
9174 Sky Park Court, Suite 100
San Diego, CA 92123-4340

Re: REVISED ADMINISTRATIVE DRAFT REGIONAL MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) Permit (Tentative Order No. R9-2013-0001)

Dear Ms. Walsh:

The following trade and professional associations, for the purposes of this communication known as, the regulated community, are responding as a Coalition. Spearheaded by the Building Industry Association of San Diego County (BIASD), Business Leadership Alliance (BLA), Associated General Contractors, San Diego (AGC), NAIOP (National Association of Industrial & Office Properties), Associated Builders & Contractors (ABC), the San Diego Regional Chamber of Commerce (SDRRC), the San Diego Association of Realtors® (SDAR), and the Building Owners & Managers Association (BOMA), the San Diego Chapter of the American Society of Landscape Architects and the members thereof, we appreciate the opportunity to provide comments on the Draft of the San Diego County Regional MS4 Permit (Draft Permit or Order). We submit these comments in addition to and in support of comments made by our affiliate the Building Industry Association of Southern California and its coalition partners. This Coalition employs over 210,000 San Diegans and generates in excess of $ 3 billion dollars of economic activity in the San Diego region.

At the request of the Regional Board, the Coalition submits the following observations, recommendation for revisions to the permit language and the rationale supporting those recommendations in the following areas:

1. Recent Legal Opinions and Legislation
2. Water Quality Improvement Plans,
3. Illicit Discharge Detection and Elimination Requirements,
4. Permanent BMP Performance and Sizing Requirements,
5. Sediment Supply Requirements.
6. Streambed Restoration
7. Vague and Conflicting Definitions
8. Hyrdomodification Management BMP Requirements
9. Alternative Compliance to Onsite Structural BMP Performance Requirements

Recent Legal Opinions and Legislation

On January 8, 2013, The United States Supreme Court rendered its opinion in *Los Angeles Flood Control District v. Natural Resources Defense Council, Inc., Et Al.* 568 U.S. ____ (2-13). In overturning the 9th Circuit, the Supreme Court held that "the flow of water from an improved portion of a navigable waterway into an unimproved portion of the very same waterway does not qualify as a discharge of pollutants under the CWA". The holding appears to be in direct conflict with Findings 1, 3, 6, 7, 8, 10, 11, 15, 28, and 32 of the Order as well as many of the permit provision. The Coalition requests that the San Diego Regional Water Quality Control Board (SDRWQCB) remand the Order to staff so that the Order may be revised in conformity with the Supreme Court's opinion.

On January 3, 2013 the United States District Court for the Eastern District of Virginia published its opinion in *Virginia Department of Transportation, Et Al., v United States Environmental Protection Agency* 213 U.S. Dist. LEXIS 981. While not precedential, the district court conducted a detailed analysis and well reasoned analysis of the use of surrogates for Total Daily Mass Loads ("TMDL")and concluded that [the State's] authority does not extend to establishing TMDLs for non-pollutants as surrogates for pollutants." In light of this well reasoned opinion, the Coalition requests that the SDRWQCB remand the Order to staff so that the TMDL provisions of the permit may be revised in conformity with the Court's opinion.

The Rainwater Capture Act of 2012 (AB 1750) took effect January 1, 2013. The act declares that use of rainwater collected from rooftops does not require a water right permit from the State Water Board. However, the law does not expand property owners' authority to collect and retain water from other impervious areas such as parking lots and driveways that would otherwise be available to other individuals holding appropriative water rights. In fact the law clearly states that it does not alter or impair any existing rights or change existing water rights law. Thus, requiring property owners to retain water that would otherwise be subject to appropriation may in fact, be a violation of the Act. The Coalition requests that the SDRWQCB refrain from enforcing any onsite retention requirements for impervious surfaces other than roofs until it has sought and obtained declivity relief concerning the authority of property owners to do so.

Water Quality Improvement Plans

The Coalition supports the RWQCB staff's efforts to develop a Tentative Order, the goal of which is to achieve improved water quality throughout the region. The Coalition further supports the staff's proposal to develop and implement Water Quality Improvement Plans (WQIP) for each of the ten watersheds in the basin as recommended by the Little Hoover Commission.[1] We believe that WQIPs provide the opportunity to solve water quality problems through an iterative and accountable process while balancing the resources required to implement WQIPs with other public and environmental programs.

For this reason we have joined the Copermittees and various environmental groups in requesting that the Regional Board focus on improving water quality through the development and implementation of WQIPs. Accordingly, we ask that the Tentative Order focus on the timely development of effective and enforceable WQIPs, that each WQIP be developed through a process that insures public participation and that each WQIP be reviewed and approved by the Board through a public hearing process. We further ask that the designation of appropriate Best Management Practices in each watershed be determined through the WQIP process. To these ends we suggest the following revisions to WQIP language in the permit.

Regional Board Staff has suggested that Copermittees will be permitted to "fail early and often" in their attempts to achieve compliance with discharge prohibitions and receiving water limitations as part of their development and implementation of WQIPs. The Coalition appreciates the sentiment behind these statements, in that it will encourage an innovative and iterative process through which much will be learned. However, it creates a dilemma for the Copermittees and the property owners within their jurisdictions. Based on the 9th Circuit's opinion in *NRDC v. Los Angeles County* 636 F.3d 1235 (9th Cir. 2011), Provisions A.1. and A.2. create strict liability numeric effluent limits, which are enforceable both under the Clean Water Act and California Water Code.

The Clean Water Act provides for enforcement of a NPDES permit violation by State and Federal Agencies as well as private citizens. Violators may be subject to civil penalties up to $34,500 per day. Given the potential for citizen enforcement, jurisdiction cannot afford to fail. California Water Codes Section 13385 also requires the San Diego Regional Water Quality Control Board (SDRWQCB) to impose a mandatory minimum penalty of $3,000 for each

[1] See Generally: Clearer Structure, Cleaner Water: Improving Performance and Outcomes, Little Hoover Commission, January 2009 a copy of which is attached hereto and incorporated by reference herein.

violation of a waste discharge requirement effluent limitation in excess of three violations within any six month period. As currently written, the Order appears to **require** that the SDRWQCB impose these penalties on Copermittees for each failure in excess of three exceedances within any six month period.

Obviously, elected officials are concerned about the budget implications of these legal liabilities. Moreover, private property owners are concerned as they realize that the cost of the penalties will ultimately be passed on to them in the form of higher taxes without any measurable benefit.

In order to address this problem, and to encourage Copermittees to find the necessary resources to develop and implement WQIPs, the Coalition proposes the following language.

Provision A.4. -- Compliance with Discharge Prohibitions and Receiving Water Limitations
Each Copermittee must achieve compliance with Provisions A.1.a, A.1.c and A.2.a of this Order through timely implementation of control measures and other actions as specified in Provisions B and E of this Order, including any modifications. The Water Quality Improvement Plans required under Provision B must be designed and adapted to ultimately achieve compliance with Provisions A.1.a, A.1.c and A.2.a. Compliance with approved Water Quality Improvement Plans will be deemed to constitute compliance with the remaining Provisions of this Order.

The Coalition believes that the Copermittees and the public should have a free hand in the development of the WQIPs. These groups have the best understanding of the problems and needs of each watershed. Therefore, the Coalition recommends that the process of reducing and eliminating non-storm water discharges be left to the consideration of the Copermittees based on the specific information for each watershed. The Coalition notes that the SDRWQCB has discretion to reject or modify any WQIP that it believes does not adequately address water quality objectives. The Coalition therefore recommends the following changes to Provisions B.3. and B.3.a.

Provision B.3. -- Water Quality Improvement Strategies and Schedules
The Copermittees must develop specific water quality improvement strategies to address the highest priority water quality conditions identified within a Watershed Management Area. The water quality improvement strategies must address the highest priority water quality conditions by reducing non-storm water discharges to and from the MS4, reducing pollutants in storm water discharges from the MS4 to the MEP, and restoring and/or protecting the water quality standards of receiving waters.

Provision B.3.a. -- WATER QUALITY IMPROVEMENT STRATEGIES
The Copermittees must identify and prioritize water quality improvement strategies based on their likely effectiveness and efficiency, and implement strategies to effectively reduce non-storm water discharges to the MS4, reduce pollutants in storm water discharges from the MS4 to the MEP, improve the physical, chemical, and biological receiving water conditions, and achieve the interim and final numeric goals in accordance with the schedules required for Provision B.2.e.(3). The following water quality improvement strategies must be included and described in the Water Quality Improvement Plan:

Once again, the Copermittees, in conjunction with the general public should have a free hand in developing the WQIPs. The inclusion of additional mandatory requirements both stifles creativity and prevents Copermittees and the public from tailoring the WQIPs to the specific needs of each watershed. The Coalition proposes that the WQIPs be reviewed and approved by the SDRWQCB after public notice and hearing. This process provides a failsafe and mitigates the need for additional mandatory requirements, which may not be applicable to a specific watershed. The Coalition, therefore recommends the following modifications to Provisions E.3., E.4. and E.5.

Provision E.3. Development Planning
Each Copermittee must utilize their land use and planning authorities to implement a development planning program in accordance with the strategies identified in the Water Quality Improvement Plan, which may include the following requirements:

Provision E.4. Construction Management
Each Copermittee must implement a construction management program in accordance with the strategies identified in the Water Quality Improvement Plan and which may include the following requirements:

Provision E.5. Existing Development Management
Each Copermittee must implement an existing development management program in accordance with the strategies identified in the Water Quality Improvement Plan, which may include the following requirements:

Given the discretionary nature of Alternative Compliance Water Quality Credit Systems, and the public interest therein, the Coalition believe that approval for these systems must remain vested with the SDRWQCB and not its Executive Officer. The Coalition suggest that Provision E.3.(d). be modified accordingly.

Provision E.3. (d) -- Alternative Compliance Water Quality Credit System Option
The Copermittee may develop and implement an alternative compliance water quality credit system option, individually or with other Copermittees and/or entities, provided that such a credit system clearly exhibits that it will not allow discharges from Priority Development Projects to cause or contribute to a net impact over and above the impact caused by projects meeting the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2). Any credit system that a Copermittee chooses to implement must be part of a Water Quality Improvement Plan approved by the SDRWQCB.

The Coalition believes that the timing and procedures for the development of the WQIPs are procedurally and technically infeasible. The simultaneous preparation of ten WQIPs assumes that there are sufficient experts available to take on these tasks simultaneously. The Coalition disagrees. Attempting to prepare ten plans contemporaneously within the time lines proposed can only result in ten poorly developed plans. Moreover, at least two of the watersheds require input from Orange County and Riverside County Copermittees who will not be subject to the provisions of the permit for some time.

The Coalition believes that the better approach is to allow the Copermittees to prepare a suggested schedule for review and approval by the SDRWQCB as provided by the suggested revisions to Provision F.1.a.(1).(c). If these revisions are adopted Provisions F.1.a.(1)(c), F.1.a.(1)(d), F.1.a.(2).(b), F.1.a.(1).(d), F.1.a.(2).(b), F.1.a.(2).(c.) and portions of F.1.b. are no longer required.

Provision F.1.a.(1).(c)
Within 90 days after the commencement of coverage under this order, the Copermittees must develop and submit a Water Quality Improvement Plan schedule to the SDRWQCB for consideration and approval or amendment and approval. Said schedule will be based on the level of complexity and water quality of each watershed. Copermittees may propose either serial or concurrent preparation of the Water Quality Improvement Plans based on criteria to be established by the Copermittees. Copermittees must develop and submit the Water Quality Improvement Plan requirements of Provision B to the SDRWQCB. The SDRWQCB will issue a public notice and solicit public comments on the Water Quality Improvement Plan for a minimum of 60 days. After a public hearing the San Diego Water Board may either adopt or amend and adopt the Water Quality Improvement Plans as enforceable time scheduled orders. In the alternative, the San Diego Water Board may remand the Draft Water Quality Improvement Plans to the Copermittees for further modification. The Copermittees must revise the priority water quality conditions and numeric goals based on comments received and/or recommendations or direction from the San Diego Water Board. Until a Water Quality Improvement Plan is adopted by the San Diego Water Board, the watershed shall be subject to Provisions A.1.a, A.1.c and A.2.a of this order.

Provision F.1.a.(1).(d)

Provision F.1.a.(2).(b)

Provision F.1.a.(2).(c)

Provision F.1.b. -- WATER QUALITY IMPROVEMENT PLAN SUBMITTAL

(4) The Water Quality Improvement Plan must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of acceptance by the San Diego Water Board.

Finally the Coalition suggests that the procedures for the approval of WQIP Updates mirror the approval process for initial adoption. Accordingly the Coalition suggests the following revisions to Provision F.2.c.

Provision F.2.c. WATER QUALITY IMPROVEMENT PLAN UPDATES
The Water Quality Improvement Plans must be updated in accordance with the following process:

(1) The Copermittees must implement a public participation process to solicit data and information to be utilized in updating the Water Quality Improvement Plan.

(2) The Copermittees are encouraged to involve the public and key stakeholders as early and often as possible during the updates to the Water Quality Improvement Plan.

(3) The Copermittees for each Watershed Management Area must submit requested updates to the Water Quality Improvement Plan, with the public input received and the rationale for the requested updates, either in the Annual Reports required pursuant to Provision F.3.b, or as part of the Report of Waste Discharge required pursuant to Provision F.5.b. After a public hearing the SDRWQCB may either adopt or amend and adopt the Water Quality Improvement Plans Updates as an amendment to an enforceable time scheduled order. In the alternative, the SDRWQCB may remand the Draft Water Quality Improvement Plan Update to the Copermittees for further modification.

(4) The Copermittees must revise the requested updates as directed by the SDRWQCB .

(5) Updated Water Quality Improvement Plans must be made available on the Regional Clearinghouse required pursuant to Provision F.4 within 30 days of acceptance of the requested updates by the San Diego Water Board.

Illicit Discharge Detection and Elimination

The Coalition is concerned about the unanticipated consequences associated with the Permit's definition of "illicit discharges ""Persistent Flows" and the application of that definition to discharges of perched water through subsurface drains. The permit defines an "illicit discharge" as "Any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from firefighting activities [40 CFR 122.26(b)(2)]." The permit goes on to define a non-storm water discharge as "All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). Non-storm water includes illicit discharges and NPDES permitted discharges." For the reasons described below, this interpretation is neither enforceable nor technically feasible.

The proposed permit requires development and redevelopment projects to retain the 85th percentile storm event on the project site and either use on site storage for reuse, infiltration or evapotranspiration of that water. [Citation] The available area where soil is conducive to infiltration within the County of San Diego is extremely limited. These available areas include soil adjacent to river or stream beds, coastal sandy deposits, and valleys (e.g. along San Luis Rey River, beaches, and Mission Valley) and are a small fraction of the County area. Therefore, the parameters in the permit cannot be met on most projects. About 90 percent of the area of San Diego County belonging to Region 9 is likely deemed geotechnically infeasible for infiltration (soils Type C and D, see California Geological Survey - Preliminary Surface Geological Materials Map attached hereto).

Normally, these areas where infiltration can be performed are protected for environmental purposes (i.e. canyon drainages where the existing vegetation protects animal and waterway environments) However, in those areas where the native soils are permeable and development or redevelopment are permitted, building ordinances and design specifications require compacted fill at grade for higher density projects. The compacted fill has a reduced void structure and therefore does not facilitate water infiltration. Thus, this infiltration requirement as written pits the goal of minimizing urban sprawl though high density development with an attempt to infiltrate precipitation.

Because of the soil conditions in the geographic area regulated by this permit, much of the infiltrated water does not reach ground water aquifers but rather becomes perched water which tends to collect around subsurface utility lines, engineered fill soils, foundations and other structures. Unless the perched water can be allowed to escape, there is an almost certain probability of damage to critical infrastructure such as roads and utilities necessary to protect the health, safety and welfare of the community, as well as buildings, driveways, parking lots, etc. . There are necessary persistent flows of perched water, necessary for the safety of existing and future utilities, roads and structures, that the Copermittees should not be required to address unless the Copermittees or Board identify those discharges as a source of pollutants to the receiving waters.

The Permit offers the alternative of retention and reuse of water on site. As discussed at the Permit workshops, this alternative is both impractical and likely in violation of California law. First, because of the unique rain patterns in Southern California the scale of any retention structures would be enormous and costly well beyond any benefit to water quality particularly as applied to critical infrastructure projects such as roads and airports. Second, assuming that it is technically feasible to capture the runoff, doing so is likely to contravene other state laws and policies such as protection of wetland habitats[2], and previously granted water rights.[3]

The permit impermissibly assumes that any water flowing in a storm drain seventy two hours after an arbitrary 0.1 inch storm event during three consecutive monitoring and/or inspection events is

---

[2] By capturing all events smaller or equal than the 85th percentile rain event, the runoff volumes are likely to be less than they were in the predevelopment condition, thereby drying up streams and valuable wetland habitat. The use of a universally accepted rainfall-runoff methodology such as the NRCS Method proves that events smaller than the 85th percentile rainfall event may generate a significant percentage of their volume as a runoff, depending on the soil type, antecedent conditions and vegetation type.

[3] If the amount of water being retained on site exceeds the amount of water retained in pre development condition, the additional water being retained will likely violate the prior appropriation rights and pueblo rights of others.

Persistent Flow, and therefore should be eliminated "through targeted programmatic actions and source investigations" (Section D Monitoring and Assessment Program Requirements(4)(b)(1)(c)(ii). First, the natural drainage from even an undeveloped site can take more than seventy two hours in many cases and could presumably be present during three consecutive monitoring and/or inspection events. As a matter of fact, a simple review of USGS precipitation and runoff records in a natural watershed in the area, such a San Mateo Creek, proves without a doubt that wet periods may take more than a month to fully drain natural runoff especially in wet years even for relatively small watersheds. Second, natural precipitation which is infiltrated on site is likely to emerge as perched water and enter the storm drain system day, weeks or months after was originally infiltrated. Third, hydromodification BMPs may take much more than 72 hours to drain, especially for those BMPs were a significant volume of detention occurs under amended soil and the drainage is constrained by a very small orifice. Thus, the Persistent Flow ~~seventy two hour~~ definition ~~after a 0.1 inch storm event~~ lacks any scientific basis and is, therefore, both arbitrary and capricious. Forth, many consecutive smaller events smaller than 0.1 inches may generate more runoff than an isolated 0.1 inch or larger rainfall event and the permit will consider as non-storm water the runoff from the many small storm water events but not from the later event, even if runoff from the multiple smaller events is higher[4]. Thus, the seventy two hour definition after a 0.1 inch storm event lacks any scientific bases and is, therefore, both arbitrary and capricious.

For the reasons stated above, the Coalition recommends that the Permit language be modified as follows:

ILLICIT DISCHARGE DETECTION AND ELIMINATION -- NON-STORM WATER DISCHARGES

Section 2.a.1

(1) Discharges of non-storm water to the MS4 from the following categories must be addressed as illicit discharges unless the discharge has coverage under NPDES Permit No. CAG919001 (Order No. R9-2007-0034, or subsequent order) for discharges to San Diego Bay, or NPDES Permit No. CAG919002 (Order No. R9-2008-0002, or subsequent order) for discharges to surface waters other than San Diego Bay:

(a) Uncontaminated pumped ground water; and

[4] As an example, in San Diego Lindbergh, an isolated 0.13" event occurred on 10/29/1948, after 10 days without rain. The potential runoff for such event would be considered as stormwater discharge by the new permit. However, at the same place, there were 6 consecutives but separate events (using the CASQA criteria of a 6 hour threshold) all smaller than 0.1 inch: 0.08" on 2/2/1949; 0.05" on the morning of 2/3/1949; 0.04" on the late afternoon of 2/3/1949; 0.04" on 2/4/1949; 0.02" on the morning of 2/5/1949 and 0.07" on the night of 2/5/1949 for a total of 0.30 inches of rainfall in 96 hours (0:00 2/2/1949 to 0:00 2/6/1949). Any runoff observed during those 96 hours would be incorrectly considered as non-stormwater runoff by the new permit, as no event larger than 0.1" occurred since 06:00 of 1/25/1949. This example is also valid with a conservative threshold of 12 hours to separate the storms. Hundreds of examples like this can be found in Southern California rainfall records in different locations, and shows the capricious nature of the definition of non-stormwater runoff, unrelated to the natural occurrence of precipitation in our region.

Water from crawl space pumps. (2) Discharges of non-storm water from water line flushing and water main breaks to the MS4 must be addressed as illicit discharges unless the discharge has coverage under NPDES Permit No. CAG 679001 (Order No. R9-2010-0003, or subsequent order). This includes water line flushing and water main break discharges from water purveyors issued a water supply permit by the California Department of Public Health or federal military installations. Discharges from recycled or reclaimed water lines to the MS4 must be addressed as illicit discharges, unless the discharges have coverage under a separate NPDES permit.

(3) Discharges of non-storm water, including persistent flows, to the MS4 from the following categories must be addressed by the Copermittee as illicit discharges only if the Copermittee or the SDRWQCB identifies the discharge as a source of pollutants to receiving waters:

(a) Diverted stream flows;

(b) Rising ground waters;

(c) Uncontaminated ground water infiltration to MS4s;

(d) Springs;

(e) Flows from riparian habitats and wetlands;

(f) Discharges from potable water sources;

(g) Perched water discharges from foundation and footing drains

(h) Water from crawl space or basement pumps

(i) Perched water discharges from hillside/canyon drains

(6) If the Copermittee or SDRWQCB identifies any category of non-storm water discharges listed under Provisions E.2.a.(1)-(4) as a source of pollutants to receiving waters, the category must be prohibited through ordinance, order, or similar means and addressed as an illicit discharge.

~~(7) Each Copermittee must, where feasible, reduce or eliminate non-storm water discharges listed under Provisions E.2.a.(1)-(4) into its MS4 whether or not the non-storm water discharge has been identified as an illicit discharge, unless a non-storm water discharge authorized by a separate NPDES permit~~

Add to Appendix C – Definitions:

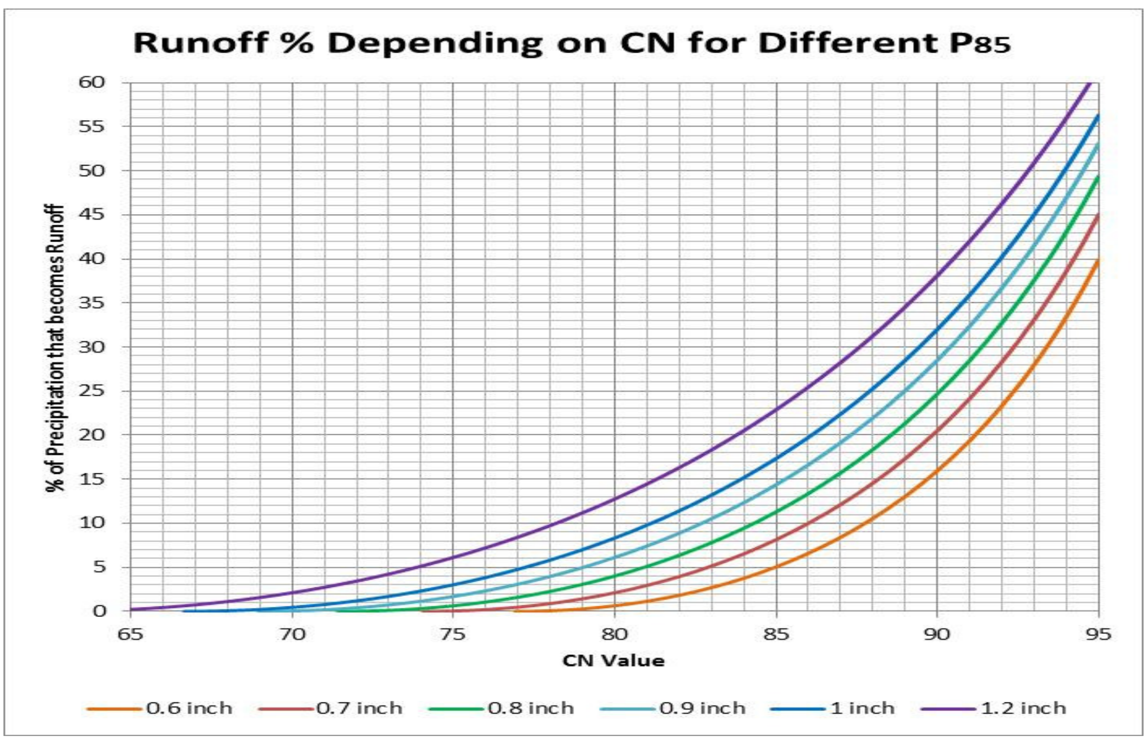
Groundwater – water that occurs beneath the water table in soil and geologic formation that are fully saturated as evaluated by a licensed geotechnical engineer/consultant or geologist.

Perched Water – water that occurs above the water table in soil and geologic formation as evaluated by a licensed geotechnical engineer/consultant or geologist.

Structural BMP Performance Requirements

The Coalition is concerned about the unintended consequences associated with the Permit's definition of LID implementation. We propose a more detailed and clear definition of the volume required for LID, as runoff should not be reduced below the expected runoff produced by the 24 hour – 85th percentile storm in natural conditions (nor the runoff produced by smaller storms in those cases where they indeed generate runoff). In natural conditions, runoff is not only a function of the precipitation event (the main variable) but also a function of the soil type, the natural vegetation type, and the Antecedent Moisture Condition (AMC) before the storm event (i.e., the degree of saturation of the soil at the beginning of the storm event). The current definition also lacks clarity in terms of the intent of the infiltration/retention LID: it is not clear if the volume retained is associated with the first storms of the season, or if it is associated with all storms smaller or equal to the 24 hour – 85th percentile storm event.

In San Diego County, the 24 hour - 85th percentile precipitation event (P_{85}) generates runoff in natural conditions, as impervious soils (Type D) are predominant in the County and poor or fair natural vegetation is common in many areas. The Coalition has prepared a figure that illustrates the percentage of runoff as a function of the Curve Number value (a well-known parameter for hydrologists and engineers to determine runoff via NRCS (SCS) method, which is a function of soil type, vegetation, and AMC), for different values of P_{85}. It is clear that runoff as a percentage of the precipitation can be as small as 0% or as large as 60% depending on the conditions of the natural terrain and the size of P_{85}.



73210745.5 0099880-00860

Removal of naturally occurring flows generated by storms similar to the 24 hour – 85th percentile storm for those natural environments where such flows do occur may have negative impacts to existing habitats, as excessive retention may alter the natural water balance. Additionally, excessive retention in soils that have a naturally limited capacity for infiltration increases the risks of failure of vital infrastructure due to lateral water migration.

Also, the intent of the permit to retain the seasonal first flush only (and not all runoff from all events smaller than or equal to the 24 hour – 85th percentile event) is not clear in the current language. It is clear in the technical literature (see for example CALTRANS CTSW-RT-05-73-02.6) that first flush treatment has a justification based on the fact that most of the time, in Southern California, treating the first storm of the season may remove built up contamination. Additionally, the first 20% - 40% of the storm volume may remove 50% - 70% of the total contaminant load (excluding sediments and trash). Finally, first flush treatment is justified by the theory of diminishing returns, because BMPs have a better efficiency removing higher loads, and the cost of treatment is more dependent on the volume of water than on the concentration of contaminants.

For the reasons stated above, the Coalition recommends that the Permit language be modified as follows:

Section E.3.c.(2)(b)

Each Priority Development Project must be required to implement LID BMPs that are sized and designed to retain the volume equivalent to the runoff volume produced from a 24-hour 85th percentile storm event after the development less the volume produced in natural conditions under the same storm. 26 ("design capture volume");

Footnote 26~~: This volume is not a single volume to be applied to all areas covered by this Order. The size of the 85th percentile storm event is different for various parts of the San Diego Region. The Copermittees are encouraged to calculate the 85th percentile storm event for each of its jurisdictions using local rain data pertinent to its particular jurisdiction. In addition, isopluvial maps may be used to extrapolate rainfall data to areas where insufficient data exists in order to determine the volume of the local 85th percentile storm event in such areas. Where the Copermittees will use isopluvial maps to determine the 85th percentile storm event in areas lacking rain data, the Copermittees must describe their method for using isopluvial maps in its BMP Design Manuals.~~ Runoff volumes must be calculated using the NRCS Method applying average AMC-II conditions, natural NRCS soil types, and the corresponding natural vegetation that exist or existed prior to development; a different hydrologic method could be approved by the Copermittees. LID is not intended to retain the runoff of all events that generate a runoff volume equal to or smaller than the runoff produced by the 24 hour - 85th percentile storm event; rather to retain the first flush up to the 85th percentile runoff difference. The 85th percentile runoff in natural conditions could be 0 or larger depending on the original natural vegetation and soil type. The time needed to use the totality of volume retained must be compatible with current regulations and water usage in the area. Proper vector control will be required in the retention facility if usage and infiltration of the retained water is expected to exceed 96 hours.

Sediment Supply Requirements

The requirement to address sediment balance is briefly mentioned in the new permit in the form of compensation of the potential sediment supply loss due to the proposal of a priority project. The sediment balance within a watershed (or the establishment of new sediment equilibrium as a consequence of many years of development in multiple watersheds) is an extremely complex issue. The Coalition is therefore very concerned about the lack of direction regarding this issue, the myriad of factors affecting a highly variable phenomena and the possibility of wasting valuable resources preparing a useless Sediment Management Plan for Priority Projects. Such plans lack direction, proper design equations, and basic understanding of the sediment transport phenomena in Mediterranean climates.

Sediment yield and sediment transport are functions of the geology of the terrain, the topography of the watershed and the slope of the main channels, the grain size distribution of the sediments existing in the network of channels, the vegetation, the annual precipitation and its distribution, the state of the vegetation prior to the rainfall (burned, dry, stable), the geometry of the main creeks and channels, the Antecedent Moisture Condition of the soil, the equilibrium conditions of slopes and of the sediments already in the network of channels in terms of stability, the existence of reservoirs or dams and the frequency and duration of their discharges in extreme events, and many other factors.

Trying to accommodate such complex factors into a one-size-fits-all solution is a recipe for disaster. Also, trying to deal with the sediment problem in a typical pre-formatted Sediment Management Plan is not only impractical, but also ineffective and resource-consuming. Sediment transport analysis made in the Tijuana River with 73 years of daily runoff data has proven, for example, that more than 70% of the sediment transport occurs less than 0.15% of the time; sediment analysis in the Santa Clara watershed has generated very similar results, with the added complication of hyperpycnal flow transport (flows with density higher than the salt water due to high sediment content), generating significant geomorphological changes in the watershed. [Warrick and Milliman: "Hyperpycnal Sediment Discharge for Semi-arid southern California Rivers: Implications for Coastal Sediment Budgets" Geology, September 2003, v-31, p. 781-784].

In addition to the complexity of the problem, many proposed solutions (such as the use of the Lane Relationship) denote the lack of understanding of sediment transport theory, as the Lane Relationship is not a quantitative equation that can be used for design, but a qualitative relation that only can be used for the purposes of discussion about the main factors affecting sediment equilibrium. [Ponce: "The Lane Relation Revisited". http://lane.sdsu.edu].

An added difficulty is related to the compensation process. It is evident that, even if sediment supply loss can be proven for a given project, adding artificial sediments to a natural creek triggers so many permits and environmental and water quality constraints, that such an alternative is infeasible. Even if the sediment addition is allowed, it is not clear what amount, size distribution, and time-variable sediment injection is required to mimic a naturally variable sediment production and transport condition that is not clearly measured nor understood.

For the above stated reason, the Coalition recommends that the permit language be modified as follows:

Section E.3.C(2)(b)

First option:

Eliminate the language until a more comprehensive and reasonable approach is developed to deal with restoration/rehabilitation projects and measurement of loss of sediment supply:

(~~b)~~ ~~Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project.~~

Second option:

Incorporate rehabilitation/restoration projects and/or protection of clearly identifiable sediment producing areas as the only feasible alternative to deal with sediment supply:

(b) Post-project runoff flow rates and durations must compensate for the loss of sediment supply due to the development project, should loss of sediment supply occur as a result of the development project. Redevelopment projects that increase pervious areas from pre-development conditions are not subject to such compensation. Compensation should be tied to restoration/rehabilitation projects for downstream creeks and/or funding for protection of identified sediment-supply areas in the watershed. WQIPs of each watershed must establish the mechanisms of restoration/rehabilitation and/or protection of sediment-supply areas.

Streambed Restoration

Currently the Tentative Order prohibits construction of any treatment control BMP within waters of the United States or waters of the state. This is appropriate for new development or redevelopment projects, which can and should be expected to treat storm water runoff prior to discharge to receiving waters. With respect to existing development, existing pollution, and efforts to improve water quality throughout the region via retrofit projects or channel, stream, and/or habitat rehabilitation, there may be situations when retrofit or rehabilitation of waters of the United States or waters of the state should incorporate structural treatment control BMPs to treat pollutants already in the water from existing development. The permit language should be modified to allow construction of pollutant removal devices within waters of the United States or waters of the state to address pollutants already existing or being conveyed in such waters. We recommend the following clarifications in the permit so that retrofit or rehabilitation projects will not be stymied by language applicable to new development or redevelopment projects:

Finding 7

7. In-Stream Treatment Systems. Pursuant to federal regulations (40 CFR 131.10(a)), in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Except where appropriate to treat existing pollution through retrofit or rehabilitation, authorizing the construction of a runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Treatment of storm water runoff from new development and redevelopment projects must occur prior to the discharge of runoff into receiving waters. Treatment control best management practices (BMPs) for new development or redevelopment projects must not be constructed in waters of the U.S. Construction, operation, and maintenance of a pollution control facility in a water body can

negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body.

Section E.3.a.(1)(b)

(b) Structural BMPs for new development or redevelopment projects must not be constructed within a waters of the U.S. or waters of the state.

Vague and Conflicting Definitions

Finally, the Coalition has significant concerns about what appears to be vague, ambiguous, and conflicting definitions of "flows" in the Order. The permit appears to identify at least six types of flows subject to regulation.

1. Wet weather flow: only mentioned three times, page A-5, page C-9 and page F-8
2. Dry weather flow: mentioned 4 times in page 43 (persistent dry weather flows, transient dry weather flows, no dry weather flows and unknown dry weather flows); in page 58 (persistent dry weather flow); in page A-5 and A-7 (e.g. dry weather flows); in page C-9 at the definition of runoff; in page F-63 three times (… as having persistent dry weather flows, transient dry weather flows, or no dry weather flows); in page F-64 (… of weather the MS4 produces persistent flow, transient flow, or no dry weather flow); twice in page F-75 (dry weather flow is the transport medium for bacteria… . Landscape irrigation is a major contributor to dry weather flow); and twice in page F-77 (are also likely sources of dry weather flow…. Examples of habitat changes from the dry weather flows);
3. No dry weather flow: page 45 and F-63
4. Transient flow : transient dry weather flow (page 43); transient non-storm water flows in page F-62; transient dry weather flow in page F-63; only as transient flows many times (pages 43, 45 three times, 57 twice, C-8, F-63, F-64 three times, and F-65).
5. Persistent flow: persistent dry weather flow (page 43, page 58); non-storm water persistent flow (page 49 in many titles, page 50 and 51); and many more times from page 49 to page 58; page 69; page F-62 to F-65. Persistent flow is many times mentioned as a non-storm water persistent flow, and sometimes as only persistent flow.
6. Combinations of all of the above.

The permit then provides the definitions or non-definitions for only three of these terms and then adds additional confusing definitions for terms that are not part of the order:

1. Persistent flow: "The presence of flowing, pooled, or pounded water more than 72 hours after a measurable rainfall event of 0.1 inch or greater during three consecutive monitoring and/or inspection events".
2. Transient flow: "All other flowing, pooled, or pounded water" The definition does not seem to comport with the definitions of Persistent Flow and Wet Weather Flow. Further clarification is required.

3. Wet weather flow: mentioned in the definition of runoff but never fully defined.

4. Runoff: All flows in a storm water conveyance system that consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water including dry weather flows. This definition includes the undefined term "non-storm water" and fails to address Persistent flows and Transient flows.

Moreover, these definitions seem to be applied inconsistently throughout the Order. By way of example:

1. Wet weather runoff: mentioned in F-11: "… and a distinction between storm water (wet weather) runoff and non-storm water (dry weather) runoff was emphasized."

2. Wet weather discharges: they are mentioned in F-37: "Non-storm water (dry weather) discharges from the MS4 are not considered storm water (wet weather) discharges and therefore are not subject to the MEP standard".

The Coalition respectfully requests that the SDRWQCB direct its staff to redraft the permit using consistent and intelligible terms and definitions.

Hydromodification Management BMP Requirements

The Coalition requests the following text be added to Provision E.3.c.(2)(d):

(d) Exemptions

Each Copermittee has the discretion to exempt a Priority Development Project from the hydromodification management BMP performance requirements of Provisions E.3.c.(2)(a)-(b) where the project:

(i) Discharges storm water runoff into existing underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean;

(ii) Is a redevelopment Priority Development Project that meets the alternative compliance requirements of Provision E.3.c.(3)(b)(ii);

(iii) Discharges storm water runoff into other areas identified by the San Diego Water Board as exempt from the requirements of Provisions E.3.c.(2)(a)-(b); or

(iv) Discharges storm water runoff to areas that are defined as exempt from hydromodification management as determined by approved Water Quality Improvement Plans.

Alternative Compliance to Onsite Structural BMP Performance Requirements

In light of the issues and suggested changes discussed above, the Coalition believe that Provision E.3. needs to be revised as noted below. The intent of the revisions is to remove unnecessary obstacles to alternative compliance options that would otherwise provide significantly more benefits to receiving water quality than onsite LID BMPs. For example, (3)(a)(iv) below would effectively prohibit storm water, treated onsite for pollutants, from being discharged into a reach of receiving water with low susceptibility, but with an alternative compliance option downstream.

(3) Alternative Compliance to Onsite Structural BMP Performance Requirements

(a) Applicability

At the discretion of each Copermittee, Priority Development Projects may be allowed to utilize an alternative option to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) under the following conditions:

(i) The Copermittee must determine that implementation of the alternative compliance option will have a greater overall water quality benefit for the Watershed Management Area than fully complying with the performance requirements of Provisions E.3.c.(1) and E.3.c.(2) onsite;

(ii) The alternative compliance options must be designed by a registered professional engineer, geologist, architect, or landscape architect;

(iii) The alternative compliance options must be implemented within the same hydrologic unit as the Priority Development Project, and preferably within the same hydrologic subarea;

(iv) The pollutants in storm water runoff from the Priority Development Project must be treated to the MEP prior to being discharged to receiving waters;

(v) Unless otherwise allowed by Provision E.3.c.(3)(b), the alternative compliance options must have a net result of at least the same level of pollutant removal as would have been achieved if the Priority Development Project had fully complied with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1) onsite;

(vi) Unless otherwise allowed by Provision E.3.c.(3)(b), the alternative compliance options must have a net result of at least the same level of protection from potential downstream erosion in the receiving water as would have been achieved if the Priority Development Project had fully complied with the hydromodification management BMP performance requirements of Provision E.3.c.(2) onsite; and

(vii) The alternative compliance options utilized by the Priority Development Project to comply with the performance requirements of

Provisions E.3.c.(1) and E.3.c.(2) must have reliable sources of funding for operation and maintenance.

(b) Alternative Compliance Project Options

The Copermittee may allow implementation of one or more of the following project options as part of an alternative approach to complying with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2):

(i) *Onsite LID Biofiltration Treatment Control BMPs*

The Copermittee may allow Priority Development Projects to utilize onsite LID biofiltration treatment control BMPs to comply with the storm water pollutant control BMP performance requirements of Provision E.3.c.(1). Onsite LID biofiltration treatment control BMPs must be sized and designed to:

[a] Remove pollutants from storm water to the MEP; AND
[b] Have an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP; AND
[c] Biofilter at least 1.5 times the design capture volume that is not reliably retained onsite, or biofilter an equivalent volume that demonstrates at least the same contaminant load reduction that would occur if a retention LID volume is in place; OR
[d] Biofilter up to the design capture volume that is not reliably retained onsite, AND 1) treat the remaining portion of the design capture volume not retained onsite with conventional treatment control BMPs in accordance with Provision E.3.c.(1)(c), and 2) if necessary, mitigate for the portion of the pollutant load in the design capture volume not retained onsite through one or more alternative compliance project, in-lieu fee and/or water quality credit system options below.

(ii) *LEED Certified Redevelopment Projects*

The Copermittee may allow redevelopment Priority Development Projects to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) where the project is designed and constructed to be certified under the USGCB LEED for New Construction and Major Renovations green building certification program. The Priority Development Project must receive at least one (1) Site Design credit and two (2) Stormwater Design credits under the Sustainable Sites category.27

(iii) *Watershed-Based Planned Development Projects*

The Copermittee may allow Priority Development Projects greater than 100 acres in total project size (or smaller than 100 acres in size yet part of a larger common plan of development that is over 100 acres) to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2). The Priority Development Project must comply with the following conditions:

[a] The Priority Development Project was planned utilizing watershed and/or subwatershed based water quality, hydrologic, and fluvial geomorphologic planning principles that implement regional LID BMPs in accordance with the performance and location criteria of this Order and acceptable to the San Diego Water Board;

[b]

(iv) *Offsite Regional BMPs*

re volume that is not reliably retained onsite.

[a] The Copermittee may allow Priority Development Projects to utilize offsite regional BMPs to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) if the offsite regional BMPs have the capacity to manage the storm water flows rates and durations from the site such that the receiving waters are protected from the potential for increased erosion that would be caused if the unmanaged portion of the runoff was discharged from the site.

(v) *Offsite Retrofitting Projects*

The Copermittee may allow Priority Development Projects to utilize offsite retrofitting projects to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the retrofitting projects have been identified within the strategies included in the Water Quality Improvement Plan, or identified as potential retrofitting projects by the Copermittee pursuant to Provision E.5.

(vi) *Offsite Channel, Stream, or Habitat Rehabilitation Projects*

The Copermittee may allow Priority Development Projects to utilize offsite channel, stream, or habitat rehabilitation projects to comply with the hydromodification management BMP performance requirements of Provision E.3.c.(2) if the rehabilitation projects have been identified within the strategies included in the Water Quality Improvement Plan, or identified as potential channel rehabilitation projects by the Copermittee pursuant to Provision E.5. The channel, stream, or habitat rehabilitation project cannot be utilized for pollutant treatment except where artificial wetlands are constructed and located upstream of receiving waters.

(vii) *Offsite Regional Water Supply Augmentation Projects*

The Copermittee may allow Priority Development Projects to utilize offsite regional water supply augmentation projects (i.e. groundwater recharge, recycled water, storm water harvesting) to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the projects have been identified within the strategies included in the Water Quality Improvement Plan.

(viii) *Project Applicant Proposed Alternative Compliance Projects*

The Copermittee may allow one or more Priority Development Project applicant(s) to propose and implement alternative compliance projects to comply with the storm water pollutant control and hydromodification management BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2) if the alternative compliance projects are consistent with, and will address the highest water quality priorities of the Water Quality Improvement Plan, and comply with the requirements of Provision E.3.c.(3)(a).

(c) Alternative Compliance In-Lieu Fee Option

The Copermittee may develop and implement an alternative compliance in-lieu fee option, individually or with other Copermittees and/or entities, as a means for designing, developing, constructing, operating and maintaining offsite alternative compliance projects under Provision E.3.c.(3)(b). Priority Development Projects allowed to utilize the alternative compliance in-lieu fee option must comply with the following conditions:

(i) The in-lieu fee must be transferred to the Copermittee (for public projects) or an escrow account (for private projects) prior to prior to the issuance of the certificate of occupancy for the Priority Development Project is initiated.

(ii) If the in-lieu fee is applied to the development, design and construction of offsite alternative compliance projects, the following conditions must be met:

[a] The offsite alternative compliance projects must allow the Priority Development Project to comply with the onsite BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2);

[b] The offsite alternative compliance projects must be constructed by the Copermittee or its agent as soon as possible, but no later than 4 years after the certificate of occupancy is granted for the first Priority Development Project that contributed funds toward the construction of the offsite alternative compliance projects, unless a longer period of time is authorized by the San Diego Water Board

Executive Officer provided, however, that the project proponent's sole responsibility shall be the payment of the in-lieu fee;

[c]

[d] The in-lieu fee must also include the cost to operate and maintain the offsite alternative compliance projects.

(iii) If the in-lieu fee is applied to the operation and maintenance of offsite alternative compliance projects that have already been constructed, the offsite alternative compliance projects must allow the Priority Development Project to comply with the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2).

(d) Alternative Compliance Water Quality Credit System Option

The Copermittee may develop and implement an alternative compliance water quality credit system option, individually or with other Copermittees and/or entities, provided that such a credit system clearly exhibits that it will not allow discharges from Priority Development Projects to cause or contribute to a net impact over and above the impact caused by projects meeting the onsite structural BMP performance requirements of Provisions E.3.c.(1) and E.3.c.(2). Any credit system that a Copermittee chooses to implement must be submitted to SDRWQCB for review and acceptance as part of the Water Quality Improvement Plan.

Thank you for consideration of the Coalition's comments on the Administrative Draft of the Permit. We look forward to working with the Regional Quality Control Board and its staff on improving the final draft with a goal toward achieving improved water quality in harmony with the Regional Board's Basin Plan.

Very truly yours,

Borre Winckel
President & CEO of the BIASD
On behalf of the Coalition

State of California

LITTLE HOOVER COMMISSION

January 22, 2009

The Honorable Arnold Schwarzenegger
Governor of California

The Honorable Darrell Steinberg
President pro Tempore of the Senate
and members of the Senate

The Honorable Dave Cogdill
Senate Minority Leader

The Honorable Karen Bass
Speaker of the Assembly
and members of the Assembly

The Honorable Michael Villines
Assembly Minority Leader

Dear Governor and Members of the Legislature:

Clean water is a cornerstone of California's economic and environmental well-being.

As the state's lead water quality guardians, the State Water Resources Control Board and the nine Regional Water Quality Control Boards play a critical role in the state's health. Their job is to protect and improve the state's aquifers, rivers, lakes and shoreline.

For that job, however, the boards today must rely on regulatory tools that are not adequate to address modern threats to water quality, resulting in a system that has lost the confidence of the very people it needs to ensure clean water. The governor and Legislature must exercise their leadership to reform the current system into one that assures transparency, consistency and accountability, and demonstrates that it is improving water quality.

The boards face a daunting task. For decades, the boards' actions, supported by substantial federal investment – have led to a dramatic decrease in water pollution from wastewater treatment plants and other so-called "point sources," which discharge into water or the ground from a pipe. The current threats to the state's water quality, however, are far more difficult to solve, even as demand for clean water increases from a growing population and an economically important agricultural industry.

Stormwater pollution, caused when rains pummel the impervious surfaces that dominate cities and suburbs and sweep debris and contaminants into the state's waters, is one of the biggest water quality problems facing the state and country. Local governments, homebuilders and many industries face expensive fixes to limit and capture stormwater, and water boards are struggling with how to best regulate a diffuse pollution source. Other non-point sources, including agricultural runoff and decades-old legacy pollutants, also present challenges.

California relies on a system created nearly four decades ago, with a state board and nine separate regional boards that enjoy enormous autonomy. While regional decision-making remains essential to solutions that fit local conditions, the current structure places too little emphasis on accountability and outcomes. No one is holding regional boards truly accountable for protecting and improving water quality. Regional boards, in turn, are overwhelmed by their tasks. The inability of the state board to implement statewide policies, practices and standards leads to inconsistencies and inefficiencies in how regional boards operate, creating the perception by water users, environmentalists, local governments and others that the boards' actions often are arbitrary and unfair.

The boards' continuing struggles with information technology, data and science lead to conflict over information, instead of policy. This complicates the ability for the public and policy-makers to get an accurate reading on the state of the state's water quality, and to determine which regulatory programs are effective in improving water quality.

California's current system for ensuring water quality does not rank the biggest threats to water quality and systematically match its finite resources to address the most serious of them using the tools of scientific and economic analysis. In this report, the Commission recommends the state board make better use of data to identify the biggest threats to water quality. The Commission recommends making greater use of science in determining the cause and remedies to water contamination as well as economic analysis to inform which options offer the greatest improvement within the available resources.

The Commission recommends reducing the size of the regional boards to seven members, all appointed by the governor, and making the regional chair a full-time position. The state board should be expanded to nine members, with five members, also appointed by the governor, representing a statewide perspective. The remaining four would be regional chairs serving staggered, two-year terms. Regional boards should focus on setting policy, not issuing permits.

While this review focuses on the water boards' duties to regulate water quality, the Commission is hopeful that it can become part of a broader conversation the state needs to engage in about its overall governance strategy for water. With a crashing Sacramento-San Joaquin River Delta, declining fish species, and continuing questions about how best to deliver water from north to south, California policy-makers must use 2009 to create an overall governance structure that can produce thoughtful responses that acknowledge the intertwined issues of water quality, water rights and water supply.

Facing increasing demand for water and the likelihood of diminishing supply, California undoubtedly will have to rely on cleaner local water supplies to meet future needs. The water boards will play a key role in this as they carry out their mission to protect and improve water quality. Reforming those boards is a first step, and one that is urgently needed.

Sincerely,

Daniel W. Hancock
Chairman

CLEARER STRUCTURE, CLEANER WATER:

IMPROVING PERFORMANCE AND OUTCOMES AT THE STATE WATER BOARDS

Table of Contents

Table of Sidebars & Charts

Executive Summary

California is attempting to solve modern water pollution problems with an antiquated system.

Nearly four decades after the Legislature created the legal foundation to police water quality in the state, the governance structure surrounding the State Water Resources Control Board and the nine Regional Water Quality Control Boards is showing its age. The boards are overwhelmed and under-achieving, and have lost the confidence of a diverse array of water stakeholders.

The decentralized regulatory and permitting structure – with largely autonomous regional boards issuing permits, conducting enforcement and carrying out a wide array of other duties – has created a system that lacks consistency, accountability and transparency, and is unable to match resources to priorities. In fact, lack of prioritization is a fundamental weakness in state water quality regulation. The water boards' broad and ambitious mandate – to protect all waters at all times – set by state and federal law, makes it difficult to set priorities. This mandate, coupled with a state board that does not exercise enough authority over regional boards and the boards' failure to consistently consider the costs and benefits of various clean water solutions, leaves California's water quality system with dozens of priorities and, in effect, no clear, statewide priorities.

The state needs a smarter strategy to support the boards' critically important mission: protecting and improving the state's 7,800 square miles of surface water, as well as its ground water aquifers. Demand for water will grow in a state expecting a population boom. And as Governor Arnold Schwarzenegger's drought declaration in summer 2008 underscored, water is a scarce resource. The boards' work will have a profound impact on California's future: Clean water is essential to the environment, the economy and the state's well-being.

Despite the importance of water, there are ominous signs of water quality problems throughout the state. The ecological health of the Sacramento-San Joaquin River Delta, the country's largest estuary and the key cog to the state's daily efforts to deliver water from water-rich Northern California to parched Southern California, is deteriorating, partially due to water quality problems. Fish that rely on the Bay Delta, from the Delta Smelt to the Chinook Salmon, are disappearing, due to a combination of factors, including water pollution. Beaches are closed due to water quality issues, and groundwater in parts of the Central Valley is tainted with contaminants.

As these problems indicate, the state and regional water boards face enormous challenges as they attempt to find and lessen the sources of pollution.

Urban stormwater is one of the biggest challenges the state faces. Stormwater pollution is essentially caused by modern city life, as rainwater sweeps metals, lawn fertilizer and other pollutants from city and suburban streets into nearby streams, lakes and the ocean. These sources of pollution are diffuse and difficult to control. For example, the San Francisco Bay regional board has been working for a decade to determine ways to reduce copper pollution in the Bay. The answer may lie in changing the composition of brake pads in cars, which leave copper residue on roads that is pushed into the Bay during storms.

No topic dominated the Commission's study like stormwater regulation. It is the area in which the boards' patchwork of permits has an effect on virtually everyone in California. More than 30,000 stormwater discharges are subject to permits (compared to about 2,200 permits for wastewater treatment) that regulate the behavior of large and small cities, construction sites and industry. A diverse group of water users – the military, small and large businesses, home builders, local governments and more – face enormous costs as they try and control and limit stormwater pollution. Regional boards issue many of the permits, and boards have differing philosophies and policies toward stormwater regulation in the absence of statewide policies and scientific consensus on causes and solutions. As a result, stormwater discharges are subject to significantly different levels of regulation depending upon the region. The costs of cleaning up stormwater are enormous, fueling the debate about who should pay. The costs of stormwater pollution, however, are far greater, as beach closures impact the state's economy and environmental damage threatens to impair wildlife.

Other problems are equally difficult. Agricultural runoff contaminates water throughout the Central Valley and other regions, and efforts are just getting underway to address it. Many regions are seeking to lower levels of salinity in water, which limits its use for drinking supplies or irrigation. So-called legacy pollutants, which settled into waterways years, decades or even a century ago, remain harmful today. Mercury used to aid gold mining in the Sierra Nevada in the 1800s continues to pollute many northern California water bodies.

And while implementation of the federal Clean Water Act and the state's Porter-Cologne Water Quality Control Act, the two key laws governing water quality, have made profound improvements in wastewater treatment discharges, wastewater remains a critical statewide problem. Local governments, representing small, poor communities as well as larger, richer urban areas, are struggling to pay for upgrades needed to protect the state's waters and ensure they are safe to swim in, fish in or drink. An EPA report noted that California would need to spend more than $18 billion to properly upgrade and expand wastewater treatment.

In its study of California's water boards, the Commission focused on the boards' role in water quality regulation, by design excluding the state water board's administration of water rights. Quality and supply and the rights to that supply are profoundly intertwined and worthy of broader analysis and discussion. The Commission urges the state to use this report as a guide to improving water quality regulation, as well as a starting point for the important discussion on the much larger water issues facing the state, a discussion that must embrace water rights, water supply and restoration of the Sacramento-San Joaquin River Delta. Clean water is essential to the state's water future, but clean water is an unattainable goal without clear policies on the state's other pressing water issues.

Through public hearings, meetings of two Commission-created advisory committees, extensive interviews with stakeholders and a review of available research, the Commission identified the following critical problems with California's efforts to regulate and improve water quality:

- ***The relationship between the state and regional boards is not well-defined, leading to inconsistencies and inefficiencies among boards, an inability to set statewide priorities and a lack of focus on holding regional boards accountable for clean water outcomes.*** In statute, the state board has significant authority to steer regional board policies and provide statewide leadership. In practice, however, the state board does not provide enough oversight and regional boards have dramatically different approaches to similar problems, statewide priorities are unclear and there is not enough effort to understand which regional boards are the most effective at implementing clean water laws.

- ***The state and regional boards lack mechanisms to collect and analyze data properly, use scientific research and cost-effectiveness reviews to drive decision-making and provide useful information to the public, policy-makers and other researchers.*** Regional boards acknowledge they do not always have sufficient data to make decisions, determine whether programs are effective, or analyze whether the costs of regulation are worth the incremental benefits to our water supplies. The state has struggled to implement an information technology system and coordinate scientific research so that it is applied in regulatory processes. Basin plans, the key regulatory document dictating most regional board processes, are out of date in most regions.
- ***An antiquated regional board structure limits candidates for regional boards, hinders transparent decision-making and asks volunteer board members to do too much.*** Regional boards face complex decisions that require water expertise that some board members do not have. Compounding that difficulty are ex parte rules that limit board members' ability to communicate with stakeholders, who in turn feel they are not able to work with boards in a collaborative manner. Federal and state conflict-of-interest provisions dramatically limit the pool of potential qualified candidates.
- ***The appeals process is broken.*** Few stakeholders expressed confidence in the appeals process, arguing it was unclear why the state board decided to hear an appeal or not, and that the state board often appeared unwilling to overturn regional board decisions. In addition, because of their role as an appellate, the state board is reluctant to intervene in regional board matters that could benefit from a state board perspective before appeals are needed.
- ***The state – both water boards and other state agencies – is struggling to adapt appropriate strategies to address non-point source pollution.*** Non-point source pollution provides enormous challenges to the state and will require multi-agency responses, but the state has no structures in place to address water quality problems that stem from land use, centuries-old pollution and air pollution. Urban stormwater is a vexing problem with costly solutions, yet the state has not developed an adequate system for assessing and prioritizing this problem and other non-point source pollution problems.

Inherent to the water boards' inability to achieve better results is the governance structure. Regional decision-making is a cornerstone of California water quality regulation, and it remains a sound structure, due to differing local conditions. But the boards have become too autonomous, and despite efforts by the state board to close the gulf between the boards, the structure creates in appearance and practice 10 different agencies instead of one. State board members, as co-equal gubernatorial appointees with regional board members, have been unable or unwilling to exercise authority over the regional boards. Examples abound of differing policies and processes at different regional boards that are incompatible with the goal of a coherent and cohesive state policy on water quality. Regional boards have had dramatically different policies on water recycling, a key statewide issue, for example. And boards have different methods of defining impaired water bodies, unduly complicating efforts to compare problems in different regions.

In part due to this autonomous structure, there is little focus on clean water outcomes or accountability. Regional boards admit they have difficulty in analyzing watersheds to determine whether their programs are protecting and improving water quality – the boards' focus on issuing permits and determining whether dischargers abide by permits leaves too few resources dedicated to analysis of whether anything is actually working. In addition, the state board has made little effort to understand why regional boards have dramatically different enforcement statistics, even accounting for size. While the state board does have the authority to set statewide policies, set budgets and hear appeals of regional decisions, a disconnect remains between the state board and the nine regional boards.

The boards also acknowledge they have difficulty prioritizing water quality problems. Seventy-four separate revenue streams, most of which must be spent on specific purposes, prevent the boards from shifting resources toward planning or enforcement, for example. During these dire economic times, it is unlikely that the boards will receive more state funding. But they should have more flexibility to match existing resources with priorities.

In addition to the difficulty in pointing resources toward the most pressing problems, the boards fail to use any type of cost-benefit analysis to help determine priorities. While full-scale cost-benefit analysis is costly and may not be warranted in many regulatory proceedings, the boards could do a better job of considering costs to find the quickest, cheapest solutions to improve and protect water quality. Simply ignoring the costs of compliance means that, too often, the price is not worth the prize when the boards set tough standards.

Underlying many of the conflicts facing the boards is a lack of data and scientific research as well as poor information technology systems. This has led to continual conflict among boards and stakeholders over information, before even beginning the discussion on proper policy.

Data collection remains a key problem. Water quality monitoring is sporadic throughout the state, leaving water boards to regulate on the basis of incomplete information. A 2004 report noted that as much as 75 percent of the state's rivers, streams, lakes and reservoirs were unmonitored. The boards struggle to organize what data they do have, however. One analysis of the water boards' program to protect and enhance wetlands was hampered because more than 40 percent of the files for the program could not be located.

The state board has struggled to implement a new IT system, making it difficult for the public, policy-makers and even board staff to conduct basic analysis. Incredibly, many board programs still rely on paper records, rather than computerized data. Environmental groups, such as the California Coastkeeper Alliance and Heal the Bay, are much better at using water board data to provide valuable information to the public than the boards can themselves.

And while the boards conduct and fund scientific research, the state has thus far done a poor job of coordinating or consolidating that research or working to infuse it into regulatory programs. Much more research is needed – the boards face a difficult challenge in regulating non-point sources such as stormwater, as there remains a lack of knowledge regarding the best, most cost-effective methods for reducing this kind of pollution – but the boards have failed to use science available to them in an efficient, effective manner.

The lack of data and science mean that the core regulatory document for each region – the basin plan – often is decades out of date. As basin plans guide virtually all regulations in each region, this undermines the legitimacy of the state's regulatory efforts. Basin plans list the uses of water bodies and the limits on contaminants in each of the water bodies to support those uses. Despite this, the state has not committed the resources to update them: Less than 3 percent of the boards' nearly 1,600 employees are dedicated to updating basin plans. The boards' funding structure, which relies mostly on fees to support specific permitting programs and almost no General Fund dollars, leaves little money available for this critical task. The state must give this task higher priority, commensurate with the role the plans play in ensuring and protecting water quality.

In addition to such basic information problems, the boards' appeals process undermines confidence in the board system. The state board is the appellate body, and acts when petitions are filed protesting a regional board action. The state board rarely overturns regional board decisions, however, and the state board does a poor job of explaining to stakeholders how it considers appeals and why appeals are denied. In addition, the appellate role prohibits the state board from taking a more active approach to regional board issues before conflicts lead to appeals and later, costly litigation. Stakeholders suggested there is a reluctance to launch an appeals process, for fear of reprisal.

Regional board members face an increasingly difficult job, particularly for a position that is essentially a volunteer post. Permits and other issues facing board members involve complex issues that are difficult for many board members who lack technical water backgrounds to understand.

Adding to the difficulty of the job are outdated ex parte rules that often prohibit board members from interacting with stakeholders outside of time-constrained public meetings. This works against the kind of communication between stakeholders and board members required for problem solving, and leaves water users and others in the water community with no avenue to discuss complex issues with board members.

A federal and state eligibility/conflict-of-interest rule, dubbed the 10 Percent Rule, eliminates many potential board members from consideration for an appointment, making it difficult for governors to fill 81 regional board positions. Five of the nine regional boards had one-third of their board positions unfilled during periods of the Commission's study. This high vacancy rate impairs boards' abilities to establish quorums and conduct important business.

Even the smoothest-running government agency, however, would struggle with the challenges facing the water boards. Modern water pollution problems are increasingly difficult and increasingly outside of the typical regulatory purview of the boards. Some studies, for example, suggest that mercury contamination in waters along the California coastline is caused by coal-burning power plants in China.

The state must understand that water pollution is a critical problem that will require creative, multi-agency responses. Aerial deposition, for example, creates water pollution, and will require a joint response from water and air regulators. Land-use planning has a profound impact on water quality, requiring more thought from the state and local governments on how to slow and capture fast-moving stormwater that collects pollutants and deposits them in our waters.

All of these problems require important structural and procedural changes.

Toward a Reformed State Agency

A new, ideal system should include the following characteristics:

- ***A unified state water quality agency.*** Completely distinct regional boards may have been appropriate in past decades, but current common problems – urban stormwater, for example, or impairments caused by the same contaminants – call for a more centralized regulatory approach unified by a common vision and common processes. A unified state agency can better identify key problems and priorities in the state and align resources to address those problems. Efficiencies gained by a stronger bond between the state and regions will lead to clean water outcomes faster and cheaper.
- ***Local input.*** The need for local input on water quality objectives remains important, as water bodies are unique, with their own problems and solutions. Water quality objectives should continue to be set at the regional level, with vigorous debate and discussion among local stakeholders, while still subject to state oversight.
- ***A focus on accountability and outcomes.*** The public, and policy-makers, have a right to clearer information from the boards as to the state of the state's waters, and to which programs are effective – and which are not. Additionally, the boards must re-focus their mission, from ensuring that dischargers are abiding by their permits to this fundamental question: Are the state's programs protecting and improving water quality?
- ***Integrated science, accessible data.*** As water pollution problems increase in complexity, there is a need for a stronger scientific presence within board programs. The state board needs scientific advisors to help guide and coordinate research and utilize that research in regulation. In addition, the boards' dearth of water quality data must be rectified, and it can be: There are numerous federal, state and local agencies, as well as other groups, collecting information. The state must pull that information into an integrated system that allows the boards and others to access and use the information that already has been gathered.

To increase efficiency, improve cohesiveness between the state and regional boards and to better develop statewide priorities, the state board and regional boards must be reformed. The Commission proposes creating a 9-member state board, with five of the board members representing statewide perspectives. The remaining four members would be chairpersons of regional boards, serving staggered, two-year terms on a rotating basis. Regional board chairs, as well as the five state board members would be full-time, appointed by the governor and confirmed by the Senate.

Regional boards should be reduced in size from nine to seven members, with the six part-time members – aside from the chairperson – paid a per diem. The six part-time regional board members should represent various constituencies, including local government, industry, agriculture and nongovernmental organizations, as well as one spot reserved for a scientist or engineer with a background in water issues. Regional boards' missions should focus on broad policy issues, such as updating basin plans and setting regional priorities.

Regional executive officers, and the executive director of the state board, would have expanded authority to issue permits, allowing the boards to focus on quasi-legislative actions such as developing up-to-date basin plans. Permits would continue to be issued in public hearings conducted by executive officers or the executive director. Regional executive officers would report to the executive director of the state water board.

This new model would allow a stronger tie between the state and regional boards, create a "strong chair" model at the regional boards that would create new board leadership in the regions and at the state level and focus the state regional boards on policy, not permits. The state board would have better understanding of regional issues, and vice versa. The model retains the idea of regional decision-making, however, allowing regional input on setting water quality standards and beneficial uses. By reducing the regional board size, governors should have an easier time filling all board positions.

Other changes also are needed.

Ex parte rules must be reformed to allow more communication between decision-makers and stakeholders. The regulated community should have greater opportunity to talk with board members who have such significant power to influence their activities. The boards should adopt rules similar to those used by other state regulatory boards such as the Integrated Waste

Management Board, which allow communication between regulators and the regulated as long as it is disclosed at public meetings. These new rules should extend to executive officers if they are issuing permits.

A separate appeals board, comprised of water experts and appointed by the governor, should be created to hear appeals of state and regional decisions. This would restore confidence in the appeals process and allow the state board to become more active in regional board decisions before they are made.

To increase regional board accountability and provide better information to the public, the state should create easy-to-understand report cards for major water bodies throughout the state. Modeled after the report card issued by the environmental group Heal the Bay for state beaches, the report cards would provide the public with clear information about whether waters were safe to use, and whether board regulatory programs were effective. The state would need to conduct a thorough, inclusive process to determine the criteria for issuing grades, and report cards could be produced by either the state board or an outside entity, such as a water research institute like the Southern California Coastal Water Research Project or the University of California.

The boards must improve their use of science and data. The state should create a water science advisory board to help the state board determine needed areas of research, coordinate various research projects going on across the state and help the water boards incorporate research into regulatory programs. No new bureaucracy is needed – the board would consist of experts in water science who would provide advice to the state water board during regular meetings staffed by the state board.

Along with creating these new avenues to increase the use of science at the boards, the state is in desperate need of a water quality data library. The state should create an independent water data institute that would serve as a link to various federal, state and local agencies, as well as other groups, that gather water quality data. An independent institute would provide a clearinghouse where the public and policy-makers could find and compare water data. This would help the state leverage all of the water data that is gathered by various entities around the state but is currently not organized and analyzed.

Of critical importance to the water boards' effectiveness is updating basin plans in every region. The boards' reliance on out-of-date basin plans, of which many are simply unresponsive to the current, non-point water pollution issues the boards face, hinders many of their programs. The boards should emulate the model created by the Santa Ana Regional Water Quality Control Board, which created a stakeholder task force that led to robust research, consensus-building and a largely re-written basin plan in 2004. Stakeholders – not the cash-strapped state – funded the basin plan update. Authorizing regional board executive officers to issue permits and take other quasi-judicial actions will free up the board members to focus on modernizing basin plans.

The water boards, and other state agencies, must focus on solving water quality problems in creative and collaborative ways. The water boards must increase the use of public education programs, and stakeholder task forces to confront current and complex issues, as well as improving their use of regional monitoring to determine the overall effectiveness of problems and spot new trends. The boards should find ways to examine watersheds and develop solutions that increase watershed health. Water quality regulators and air quality regulators must work together to address air pollution's effects on water, and discussion must occur among state leaders regarding land use decisions that impact water quality.

Finally, the water boards should incorporate cost-effectiveness tests into their analysis of programs to help them prioritize and find the most cost-effective solutions to water quality problems. The goal is not simply to eliminate costly fixes, but to help the regulated and regulators find ways to improve water quality in the most cost-efficient manner possible and meet statutory requirements to balance water quality needs with other factors, such as economics.

Throughout its review of the water boards, the Commission met many board members and staff who were professional, dedicated and tireless in their mission of protecting water quality. Many were aware of the criticisms of the boards' structures and processes and working diligently to improve the boards. Efforts are underway at the state board to improve the information technology system, for example, and to adopt more statewide policies that provide direction to regional boards. The problems the Commission found were not due to a lack of passion or professionalism by board personnel, but rather structural and systemic issues that can be and must be changed. This gives the Commission confidence that the water boards can improve their performance in the coming years.

Recommendation 1: To move toward a more consistent, transparent and accountable governance structure that allows for both statewide policy and regional flexibility, reform the State Water Resources Control Board and the Regional Water Quality Control Boards by strengthening ties between the boards, refocusing the boards on broad policy-making and restoring confidence in the appeals process. Specifically, the state should:

- Restructure the State Water Resources Control Board as a full-time, 9-member board charged with creating state policy, setting priorities and overseeing regional board activities. Members of the board should be appointed by the governor and confirmed by the state Senate. Five members of the state board would serve solely as state board members, including one person who would be chairperson of the state board, as named by the governor. These members should have the following backgrounds: One in engineering, one in water rights law, one in water quality, one in water-related science or resource economics, and another would represent the public. The position of regional chairperson would become full-time. Four regional chairpersons would serve on the state board for staggered, two-year terms, with membership rotating among all nine regional board chairpersons.
- Reconstitute the nine Regional Water Quality Control Boards as seven-member boards with six part-time members and a full-time chairperson, all appointed by the governor. The chairperson would be charged with monitoring statewide policies that are implemented at the regional level. Boards would continue to be stakeholder-boards, with six part-time members with the following backgrounds: experience in water supply, conservation or production; irrigated agriculture; industrial water use; local government; water science or engineering; and experience with a nongovernmental organization associated with recreation, fish or wildlife. Regional boards would focus on updating basin plans, adopting Total Maximum Daily Loads and other quasi-legislative functions.
- Empower the executive officers of each Regional Water Quality Control Board and the executive director of the State Water Resources Control Board to issue permits, allowing the boards to focus on updating basin plans, setting broad policy and focusing on upcoming water quality challenges. Executive officers would become Career Executive Assignment positions and report to the executive director of the State Water Resources Control Board. Regional boards would conduct an

annual evaluation of the executive officer that would be taken under advisement by the executive director.

- Exempt state and regional board members, regional board executive officers and the state board executive director from ex parte rules within the state Administrative Procedure Act that prohibit interaction with regulated entities. Instead, require board members and permit-issuing executives to disclose their contacts with regulated entities at public meetings, as is currently done by other boards such as the Integrated Waste Management Board.

- Create a new appeals board that would address appeals of quasi-adjudicative functions such as permits and enforcement actions. Removing the appeals process from state board jurisdiction would restore confidence in the process and allow the state board to take a more proactive approach in regional board issues. The members should have backgrounds in water issues and would be appointed by the governor to hear appeals. The board would follow Administrative Procedure Act policies in conducting hearings.

Recommendation 2: The state must improve and increase its use of data, scientific research and planning to better inform the public, respond to current and future water quality problems and focus more on accountability. Specifically, the state should:

- Create a Water Science Advisory Board for the State Water Resources Control Board. Members, appointed by the state board, should have backgrounds in environmental science and engineering. The board would help both the state and regional water boards and other state water agencies coordinate research, propose needed research, advise the boards on how to incorporate research into regulatory processes and increase the effectiveness of scientific peer review.

- Create an independent Water Data Institute that would act as a state library for water quality and supply data. The institute would pool information from various state agencies and other water monitoring groups to provide accessible information to the public, regulators and researchers.

- Develop report cards. Report cards for each major water body should allow the public easy access to information they can use and could act as a way to hold regional boards accountable for their effectiveness. The report cards should be developed and published by regional science institutes or an independent entity, such as the University of California.

- Launch a statewide effort to ensure that all regions have up-to-date basin plans. Regional boards should propose stakeholder-financed efforts similar to the one conducted by the Santa Ana Regional Water Quality Control Board.

Recommendation 3: The state must increase focus on clean water outcomes and emphasize collaboration, creativity and problem-solving to address current water quality problems. Specifically, the state should:

- Collaborate with other government agencies. Because land use, automobile emissions and other factors outside the traditional purview of the water boards are major contributors to non-point source pollution of water, the water boards must work with other government agencies on solutions. The state water and air boards should routinely meet to develop regulatory strategies to address air pollution's effects on water. The state should revive the Environmental Protection Council, which already exists in statute and consists of the heads of each of the boards and departments within Cal/EPA.
- Emphasize a watershed approach. To increase focus on outcomes and solving complex problems, the water boards should develop more processes aimed at watershed health.
- Use stakeholder task forces. As the Santa Ana Regional Water Quality Control Board has done, other regional boards should increase the use of stakeholder task forces to work through difficult regulatory issues.

Recommendation 4: The water boards must develop standardized economic analysis procedures to help set priorities and determine the most effective and efficient means to improve water quality.

- To fully implement Porter-Cologne's demand that water quality regulations be reasonable, given other economic and social factors, the boards must institute the use of economic analysis into decision-making. Cost-effectiveness analysis also would increase transparency of board decision-making and help the boards set priorities.

Background

As the state's lead water regulators, California's state and regional water boards are water cops with vast influence on the environment, economy and urban planning.

The boards' mission is as complex as the state is diverse, protecting water quality everywhere from the rain-soaked North Coast and the San Francisco Bay Delta to the Mojave Desert and the concrete streambeds of Los Angeles.

Collectively, their jurisdiction includes 10,000 lakes, 200,000 miles of rivers and 3,000 miles of coastline.[1] The boards police more than 100 contaminants, ranging from the mercury that has polluted water since the Gold Rush to the trash generated by modern city life. They issue more than 50,000 discharge permits to the biggest cities and the smallest wastewater treatment plants.[2]

Today, the state and the boards face enormous pressures on water, one of California's most valuable assets. Continued population growth strains publicly-owned systems designed to treat and dispense wastewater. Pollution caused by everything from automobile brake pads to lawn fertilizer surge from city streets into streams, rivers and the ocean when it rains. In rural California, pesticides and animal waste, produced by an agricultural industry that is a key driver of the economy, pose continuing threats to community drinking water. Throughout the state, the use of water for agriculture, wastewater treatment and other necessary functions increases salinity in water, complicating its re-use.

Adding to the boards' difficulties is this: Only a fraction of the state's waters are monitored and assessed. We truly cannot answer the most basic questions concerning the state of the state's waters: Is California water safe to drink, safe to swim in, safe to fish in or safe for aquatic life? For a majority of the state's waters, we do not know.

Amid these challenges, the need for clean water has never been greater. The state Department of Finance projects California will grow to 48 million people by 2030, with much of the growth occurring in water-poor Southern California.[3] While the state currently meets most of its agricultural, municipal and industrial water needs most years, demand is growing. Water conservation practices have been effective – cities use about the same amount of water today as they did in the mid-1990s, despite adding 3.5 million more people.[4] Water use in urban areas, however, is expected to grow to 11.4 million acre-feet in 2020 from 8.8 million acre-feet in 2003, a 77 percent increase.[5] On top of this growing demand, experts believe global climate change will reduce the state's snow pack, which is a key source of water; increase sea levels; and, otherwise alter the state's hydrologic conditions.

Water quality is a key factor in the state's ongoing discussion on water supply. In short, water quality is water supply. Clean water is needed for drinking water, to help fish and to help farmers. Recycling both wastewater and urban stormwater are clearly needed to handle inevitable growing demand. Thus, as water quality is critical to the state's future, so too are the state and regional water boards.

The Commission took up the study of California's state and regional water boards to determine whether their structure and duties, and their relationship to each other, were adequate and appropriate for the challenges they face today. The boards and their staff members work hard and face complex problems. The issues regularly are contentious. The stakes are immense for Californians today and tomorrow.

From 'The Big Stench' to Porter-Cologne

The beginning of water quality regulation in its present form dates to the Dickey Water Pollution Act of 1949, which created nine regional boards and the State Water Pollution Control Board. At the time the new law was passed, California's post-war population was swelling, raw sewage was dumped directly into the ocean and Central Valley steams were inundated with industrial waste.[6] The Berkeley shoreline of San Francisco Bay was referred to as "The Big Stench" in the 1940s because of the pollution – human, industrial and other – draining through the city to the bay.[7] Prior to the Dickey Act, the official response to the outbreaks of water-borne disease and major degradation of state waters was a confusing and ineffective jumble of local and state governmental jurisdiction over water quality policy.

The Dickey Act marked the first major effort to implement state oversight of water quality. The nine-member state board and five-member regional boards created through the act were invested with the authority to impose requirements on discharges into water. It also created a regional approach to water quality regulation that continues today. "Water pollution is largely a local or regional problem," members of the Assembly Committee on Water Pollution, who drafted the act, concluded.[8]

While the structure created by the Dickey Act remains, many of its philosophical and practical underpinnings since have been discarded. The Dickey Act, for example, considered waste disposal a beneficial use of water; that is not the case today. The Dickey Act also did not give the state the authority to require dischargers to clean up discharges that were in violation of requirements.[9]

In part because of these issues, California lawmakers and regulators called for an update of the Dickey Act in the late 1960s.

That overhaul was unveiled in 1969 as the Porter-Cologne Water Quality Control Act, ushering in the modern era of water quality regulation. Named for Assemblyman Carly V. Porter and Senator Gordon Cologne, the law was described as the toughest water quality act in the nation.[10]

Porter-Cologne outlined concepts that continue to be the cornerstone of state water quality policy today:

- ***Discharge is a privilege, not a right.*** Porter-Cologne's preamble states that "the quality of all the waters of the state shall be protected for use and enjoyment by the people of the state," and the act allowed the state to permit all discharges to surface water and ground water, and prohibit discharges entirely – a broad and powerful mandate.
- ***Reasonableness is required.*** Despite that broad authority, however, the law requires regulators to balance environmental protection with other factors. The "waters of the state shall be regulated to attain the highest water quality which is reasonable, considering all demands being made and to be made on those waters and the total values involved, beneficial and detrimental, economic and social, tangible and intangible," according to the statute.[11]
- ***Basin plans as the underlying regulation.*** Regional boards were required to develop water quality control plans, which would set the uses of each water body in the region, the water quality objectives needed to meet those uses and a program to ensure implementation of those objectives. These so-called "basin plans" remain the core regulatory document for each region today.

Levels of Wastewater Treatment

There are three levels of wastewater treatment. The Clean Water Act requires secondary treatment for most wastewater treatment plants in the United States:

- ***Primary.*** Mechanical methods, such as filters and scrapers, are used to remove pollutants. This process removes solid materials.
- ***Secondary.*** Biological methods, which reduce organic matter through bacterial metabolism, are used to remove pollutants.
- ***Tertiary.*** Mechanical, biological and chemical methods, which remove nutrients or other pollutants that resist other treatments.

California's enactment of Porter-Cologne was part of a burgeoning environmental movement in the state and around the country sparked in part by dramatic examples of water pollution, most notably a spectacular fire on the pollutant-soaked Cuyahoga River in Cleveland and a massive oil spill that marred the Santa Barbara coastline.

Following Porter-Cologne, the United States Congress enacted the Federal Water Pollution Control Act Amendments of 1972, now commonly referred to as the Clean Water Act. The act emulated many aspects of California's groundbreaking law.

State, Federal Acts Provide Broad Mandate

Both Porter-Cologne and the Clean Water Act are remarkable for their broad ambition. Porter-Cologne demands the "quality of all the waters of the state shall be protected." The Clean Water Act goes even further, stating that a national goal for the discharge of pollutants into the navigable waters to be eliminated by 1985, with an interim goal that "water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water be achieved by July 1, 1983."[12]

Critics of these lofty goals note two problems. By calling for the protection of all waters, Porter-Cologne makes it difficult for the state's water regulators to set priorities. In addition, few could argue that Congress or the California Legislature have ever funded the environmental agencies charged with carrying out these laws to the level needed to accomplish their enormous tasks.

UC Berkeley Professor of Law John Dwyer included the Clean Water Act as an example in his 1990 paper titled "The Pathology of Symbolic Legislation," in which he argued that Congress approves unrealistic environmental legislation to score political points, while leaving regulatory agencies, and, often the courts, to turn symbolic goals into reasonable standards and programs.[13]

The Clean Water Act, still the central federal law governing water quality, sought to protect the country's surface waters in two key ways. Water quality standards must be set for specific water bodies, and permits are issued requiring dischargers to use the best available technology to meet those standards. The permit program is called the National Pollutant Discharge Elimination System (NPDES). The

NPDES program required minimum standards based on the best available technology, and thus most municipal wastewater treatment plants upgraded to what is referred to as secondary treatment.

For the first decade of the Clean Water Act, regulators focused on implementing technology-based standards on point source discharges – contaminants that came out of the end of a pipe.

That focus began to shift in the mid 1980s and early 1990s, however, to the Clean Water Act's second approach to protect water quality, one that emphasized outcomes as measured by the condition of water bodies. This part of the act requires states to assess water quality, determine which water bodies are unhealthy and then take steps to improve those "impaired" water bodies. Each state is required to produce a list of impaired water bodies, referred to as the 303(d) list. Once a water body is listed as impaired, the state is required to prepare a total maximum daily load (TMDL), which determines the amount of pollutants that can be safely discharged into the water. This determination, essentially a pollution budget for each water body, then is used as a basis for assigning discharge limits to each discharger into the impaired water body.

Though both were original components of the Clean Water Act, the impaired water bodies list and the creation of total maximum daily loads largely were ignored by the United States Environmental Protection Agency (US EPA) and states until environmental groups, through successful litigation, forced regulators to comply. In California, lawsuits have led to consent decrees requiring water boards to develop TMDLs in three areas of the state in adherence with timelines developed in court.[14]

The strict new requirements served as a stick to improve water quality. Historically, the Clean Water Act also provided a carrot: federal money. The act's generous Federal Construction Grant Program initially covered 75 percent of project costs for wastewater treatment plants and upgrades and launched the largest nonmilitary public works program since the Interstate Highway System.[15] Since 1972, the federal government has contributed more than $76 billion to construct and improve plants around the country.[16] Federal funding amounted to $1.2 billion between 1972 and 1987 in the San Francisco Bay Area alone.[17]

The federal act gave water quality regulatory power to US EPA, but also allowed US EPA to delegate permitting and other duties to the states. California became the first state to assume Clean Water Act responsibilities soon after the act was approved by Congress.[18]

Despite this delegation, US EPA wields significant clout over states. In California, US EPA has final say over numerous programs, and the state and regional boards spend considerable time working with the EPA to ensure they are in compliance with federal regulations. As an example of US EPA's prominence in state and regional board matters, the San Diego Regional Water Quality Control Board declined to approve a stormwater permit for southern Orange County in February 2008 after an US EPA representative spoke out against the permit during a public hearing.[19] The permit is being revised to address the US EPA's concerns.

While Porter-Cologne was amended in 1972 to include language aimed at increasing consistency between state law and the Clean Water Act, there are differences. Among the differences:

- The Clean Water Act does not regulate discharges to ground water, for example, while Porter-Cologne does.
- The Clean Water Act exempts agriculture from regulation; Porter-Cologne does not.
- The Clean Water Act requires water quality standards to be set to the level that protects water, while Porter-Cologne allows regulators to consider other issues, such as economic considerations and past, present and probable beneficial uses of the water body.[20]

Regional Boards: The Frontline for Water Quality

Both of the state's major water quality regulation laws, the Dickey Act and Porter-Cologne, embraced the concept of nine powerful regional boards comprised of representatives of industry, local government and other stakeholders impacted by board decisions. Porter-Cologne expanded the regional board from five members to nine members, as it remains today. The nine members are appointed by the governor, confirmed by the state Senate and must reside or have a business in the region in which they serve.

The Importance of Basin Plans

Basin plans are the key regulatory document in any region. "The basic purpose of the state's basin planning effort is to determine the future direction of water quality control for protection of California's waters," according to the introduction in the North Coast Regional Water Quality Control Board's basin plan.

Basin plans, called water quality control plans in the Porter-Cologne Water Quality Control Act, fulfill requirements outlined in both federal and state law. Porter-Cologne requires regional boards to develop basin plans that outline the following:

Beneficial uses. There are 23 beneficial uses defined by the state water board, ranging from drinking water to agricultural supply to recreational uses such as swimming. In addition, some regional boards have adopted unique beneficial uses, such as a "cultural" designation signifying water used for cultural purposes such as Native American subsistence fishing in the North Coast region. Basin plans typically list hydrologic units in the basin and the beneficial uses attributed to each segment.

Water quality objectives. Porter-Cologne calls on regional boards to assign water quality objectives that "in the Regional Water Board's judgment, are necessary for the reasonable protection of the beneficial uses and for the prevention of nuisance." In developing water quality objectives, regional boards are required to analyze the following factors:

- Past, present and probable future beneficial uses of water.
- Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto.
- Water quality considerations that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.
- Economic considerations.
- The need for developing housing within the region.
- The need to develop and use recycled water.

Within basin plans, water quality objectives can be numeric limits, in which the amount of a contaminant must be less than the regional board requires, or narrative limits, such as the Central Valley Regional Water Quality Board's description of limits on floating material in water, which states, "Water shall not contain floating material in amounts that cause nuisance or adversely affect beneficial uses." While some water quality objectives for specific contaminants are applicable across the basin, there are also site-specific objectives. Water quality objectives become the basis of permits issued by the board.

Implementation plan. Each basin plan includes a discussion of how the board will carry out the protection of water quality, including where discharges are prohibited, action plans for specific water bodies and other policies, such as total maximum daily loads.

Surveillance and monitoring. Basin plans also include descriptions of various monitoring programs within the region.

Basin plans are amended after public hearings, and amendments must be approved by the regional board, the state board, the Office of Administrative Law and US EPA. While the federal Clean Water Act requires states to update water quality standards every three years, regional boards typically only address a handful of issues in basin plans every three years due to staffing shortages. Thus, the last statewide initiative to conduct a major basin plan update was done in the mid-1990s.

The Porter-Cologne Water Quality Control Act. Ken Harris, Assistant Director, Office of Information Management and Analysis. October 16, 2008. Personal communication with Commission.

The regional boards' main duties are to:

- ***Create and update basin plans.*** Basin plans are the key regulatory document for each region, listing uses for specific water bodies, standards needed to protect those uses and plans to implement those standards.
- ***Issue permits or waivers.*** Dischargers – be it companies, local governments or even individuals – must receive permission from the regional boards to discharge. Discharges to surface water are issued a permit through the federal NPDES. Discharges to the ground are issued a permit through the state Waste Discharge Requirement (WDR) process. In addition, the boards can issue a general permit for an entire industry, requiring each discharger within the category to file notice with the boards that they are complying with general permit rules. Finally, boards can issue a waiver to a category of dischargers, which typically requires dischargers to pay a fee and participate in water quality monitoring but does not include other requirements. Permits are typically reviewed, updated and renewed every five years.
- ***List, respond to impaired water bodies.*** Regional boards develop biannual lists of impaired water bodies as required by the federal Clean Water Act. To remedy a given impairment, the Clean Water Act requires states to develop total maximum daily loads for each water body, which limit the amount of contaminants allowed into a water body. Each discharger is given a limit through the TMDL, which also includes an implementation schedule.
- ***Monitor discharges and compliance with permits.*** Regional boards require dischargers to monitor their discharges and provide reports to the boards. Some regions also require dischargers to contribute to regional monitoring programs that assess overall water quality in a watershed. As part of their oversight role, regional boards also inspect wastewater treatment facilities and other dischargers.
- ***Enforce regulations.*** Regional boards take enforcement actions, including issuing fines, against dischargers who are violating terms of their permits. Money from fines is placed in the Clean Up and Abatement Account, a fund managed by the state board. Regional boards can request money from the fund for a project, though distribution is controlled by the state board. Regional boards also can enter into an agreement that

Water Board Statistics

Individual National Pollutant Discharge Elimination System permits cover 639 facilities in the state. Another 1,765 facilities are regulated through a general NPDES permit. About 6,800 facilities are regulated through a WDR permit. In 2006, California had 2,237 impaired water body-pollutant lists. (Water bodies are listed by segment; therefore, the same river or lake can be listed more than once for differing contaminants based on different portions of that water body.) Currently, the state is addressing 1,001 water body-pollutant lists through 134 TMDL plans, though it has considerable work ahead, with 1,780 TMDLs still to be developed.

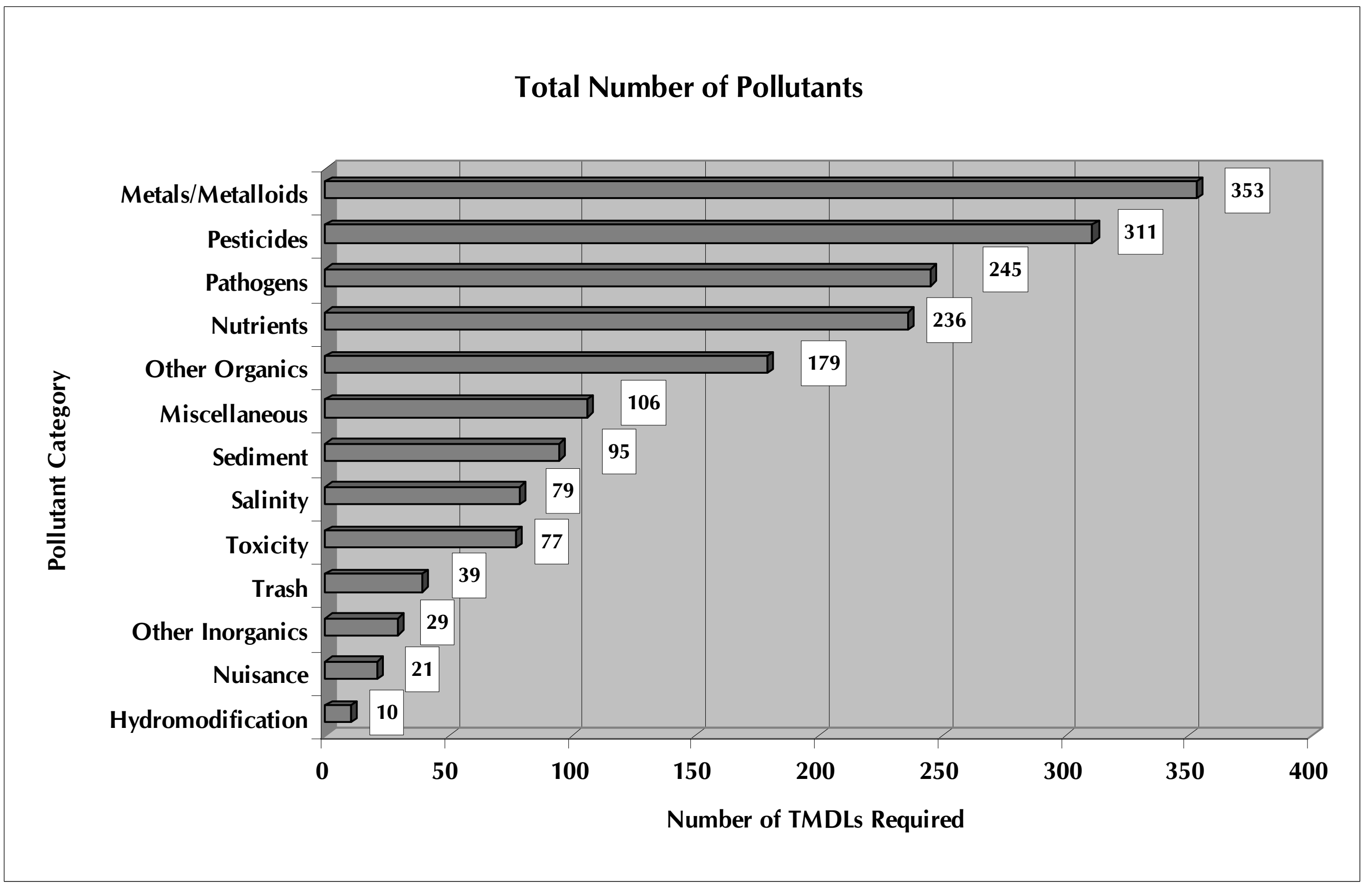
can reduce fines in exchange for the discharger performing a supplemental environmental project, or SEP, such as increased monitoring, habitat restoration or public awareness campaigns.

Regional boards typically hold monthly public meetings, in which they vote to adopt permits, take enforcement actions, implement TMDLs and conduct other business.



The chart shows the types of contaminants causing impairments to California waters that require the state to adopt total maximum daily loads or otherwise reduce the amount of the contaminant in water. Pesticides and metals are the leading causes of impairment in the state.

State Board: Designed to Set Policy, Provide Oversight

In contrast to the regional boards, the State Water Resources Control Board is comprised of full-time board members. Each of the five members is appointed by the governor and confirmed by the Senate. All but one member must represent a specific expertise, including a civil engineer, a professional engineer, an attorney with water rights experience and someone with experience in water quality issues. The governor appoints the chair.

Porter-Cologne's framers intended decision-making largely to be conducted at the regional level, while the state board was to provide oversight and direction for the regional boards. In a presentation to regional board members in April 2008, Third Circuit Court of Appeal Associate Justice Ronald Robie, who years earlier helped draft Porter-Cologne, noted that the act enhanced the role of the state board and renamed the regional boards "California Regional Water Quality Control Boards" to emphasize that they were part of one state agency, not separate, local agencies.[21]

The state board's most important duties are:

- ***Setting state policy.*** Where it sees the need for statewide consistency on an issue, the state board can adopt a statewide policy to guide regional boards. The board currently has 16 statewide policies, on issues ranging from enforcement to implementing toxics standards.

State Water Policies

The State Water Resources Control Board can set statewide policies to help guide regional board policy. Statewide policies are intended to decrease inconsistency among the boards and address important statewide issues. The board has adopted 15 policies, and has amended some of those policies. Here those policies and the dates they were adopted or last amended by the board:

- Policy for Compliance Schedules in National Pollutant Discharge Elimination System Permits (April 15, 2008)
- Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options (May 16, 2005)
- Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (September 30, 2004)
- Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program (May 20, 2004)
- Water Quality Enforcement Policy (February 19, 2002)
- Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (February 24, 2005)
- Water Quality Control Policy for Guidance on Development of Regional Toxic Hot Spot Cleanup Plans (September 2, 1998)
- Policies and Procedures for Investigation and Cleanup and Abatement of Discharges Under Water Code Section 13304 October 2, 1996)
- Water Quality Control Policy for the Enclosed Bays and Estuaries of California (November 16, 1995)
- Policy for Regulation of Discharges of Municipal Solid Waste (July 21, 2005)
- Pollutant Policy Document for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (July 21, 2005)
- Sources of Drinking Water Policy (February 1, 2006)
- Water Quality Control Policy on the Use and Disposal of Inland Waters Used for Powerplant Cooling (June 19, 1975)
- Policy Regarding Water Reclamation (January 6, 1977)
- Maintaining High Quality Water/Antidegradation Policy Implementation for NPDES Permitting (October 24, 1968)

Fees, not General Fund, Drive Boards' Budget

Beginning with the 2002-03 budget, the water boards have increasingly relied less on the general fund and more on fees from permit holders, federal funding and other special funds to sustain their activities. The General Fund contributed more than $101 million to the boards in the 2001-02 budget year, for example, but only accounts for $38.7 million in the 2008-09 budget year. In 2008-09, the General Fund comprises only about 5 percent of the boards' $733 million budget.

Board activities are funded by 74 separate revenue streams in the 2008-09 budget year, with most of the streams funding specific programs.

Thus, as the boards' duties have grown, along with the economy and population, the state has contributed less and less to their mission. The boards have the authority to raise fees every year, but that funding level is set by the Legislature and governor during the budget process.

- ***Reviewing regional board activity.*** The state board reviews and approves or denies some regional board actions, including basin plan amendments and TMDLs. The state board also has authority to set the regional boards' annual budgets.
- ***Issuing statewide permits.*** The state board also issues some statewide permits, such as stormwater permits for urban areas under 100,000 people, industrial uses, construction and the state Department of Transportation.
- ***Providing financial assistance.*** The state board oversees the distribution of federal and state dollars to help improve water quality. Funds administered by the board include the Clean Water State Revolving Fund Program, which provides about $400 million annually in loans to help improve wastewater treatment facilities and other improvements and the Clean Beach Initiative, which uses voter-approved bond borrowing to improve water quality along the state's coastline.
- ***Hearing appeals.*** The state board acts as an appellate for many regional boards quasi-adjudicatory decisions. Actions taken by regional boards, such as permitting and enforcement, can be petitioned to the state board. The state board determines whether to hear the petition and can then uphold the regional boards' action, remand the action back to the regional board with instructions on changes the state board desires, or take some other action, such as making changes to a permit or enforcement action on its own.
- ***Monitoring.*** The state board operates statewide monitoring programs, such as the Surface Water Ambient Monitoring Program (SWAMP), or Ground water Ambient Monitoring and Assessment (GAMA), with the goal of providing statewide water quality information and trends. The board also staffs the new California Water Quality Monitoring Council, which was created through legislation in 2006 and is charged with working to coordinate various monitoring efforts throughout the state to provide better water quality information to the public.
- ***Water rights.*** The state board has broad power to determine who can use surface water in the state. The board issues water rights permits, approves changes in water right permits,

and enforces permits. The Commission did not review the board's administration of water rights.

The State-Regional Relationship

The history and structure of the regional water quality control boards have important implications for implementing statewide water policies and establishing common standards. Just as all of the members of the state board are appointed by the governor, so too are all the members of each of the nine regional boards, making them semi-autonomous units. In addition, basin plans crafted in each region can set different limits on the same contaminants in different water bodies based on local conditions.

Despite language in Porter-Cologne stating that the state and regional boards "shall, at all times, coordinate their respective activities so as to achieve a unified and effective water quality control program in this state," California's approach to safeguarding and improving water quality relies on an inherently inconsistent system.[22]

In her testimony to the Commission, state board chairwoman Tam Doduc described the state boards' formal oversight of regional board activity as hearing petitions of regional board decisions, setting state policies, approving basin plan amendments and setting the budgets of regional boards.

Attorneys for both the state and regional boards are located together in Sacramento to ensure that legal advice provided to the boards is consistent.

There are other avenues to increase consistency among boards, which has been an issue championed by chairwoman Doduc during her tenure. Executive officers of the regional boards meet monthly with the state board executive director. All state and regional board members meet occasionally as the Water Quality Coordinating Committee. The committee met in San Diego in April 2008, for example, for a two-day seminar for regional board members on the water boards' history and current challenges, and again in October 2008 for a two-day seminar that included discussion of innovative practices at different regional boards.

Though statutory language requires consistent policies and procedures, critics of the current system say the relationship between the state and regional boards is ill-defined. Several reform efforts in the past five years have sought to alter the relationship between the boards, arguing that a different structure would better focus the state's strategy and use its resources more efficiently. Those efforts, all of which failed, include:

- ***2003: Abolishing the boards.*** Governor Schwarzenegger's California Performance Review (CPR), launched soon after he took office in 2003, sought to abolish both the state and regional boards as part of a major overhaul of the California Environmental Protection Agency (Cal/EPA). The overhaul would have shifted many environmental regulation duties from the quasi-independent boards to state departments. The CPR called for a new division within Cal/EPA, called the Division of Water Quality that would have issued discharge permits, developed basin plans and performed most duties of the boards. Backers of the idea suggested that placing a state department in charge of water regulation would increase consistency and efficiency throughout the state. Opponents attacked the plan in part because it could limit the public's ability to shape policy.
- ***2005: Giving the state board more authority over regional staff.*** AB 1727 (Aghazarian) would have allowed the state board to appoint the executive officer of each regional board. As the top staff person in each region, executive officers have tremendous power to set staff priorities and shape policy. Currently, executive officers are exempt positions in state government and are hired and fired by the regional boards. The 2005 proposal, sponsored by the Schwarzenegger administration, sought to give executive officers more power to issue permits and, by giving hiring authority of executive officers to the state board, give more control over daily policy to the state board.
- ***2007: Revising the composition of the regional boards and giving the state board more authority to usurp regional boards.*** SB 1001 (Perata) sought to reduce the number of regional board members to seven from nine and broaden qualifications for board members to allow anyone with a "demonstrated interest and proven ability in the field of water quality" to be eligible for a regional board position.[23] A component of this legislation allowed the state board to assume the duties of a regional board if the state board determined the regional board was not complying with state and federal water quality laws.

Water Quality Regulation Has Improved State's Waters

Porter-Cologne and the Clean Water Act as well as the work of water regulators have significantly improved the quality of California's waters over the past three decades. Most discharges are regulated, leading to a sharp decline in point source contamination.

Billions of dollars of federal and state assistance has helped cities and communities build and improve wastewater treatment plants, dramatically reducing the amount of fecal matter in rivers and bays. Federal expenditures on municipal sewage treatment led to a jump in the number of Americans being served by wastewater treatment from 42 percent in 1970 to 74 percent in 1985.[24]

In California, one analysis showed that between 1971 and 2000, discharge volume and contaminant emissions into the Southern California coastal waters from large municipal-owned wastewater treatment plants fell 90 percent, despite substantial population growth.[25] A wastewater treatment facility built after the Clean Water Act's passage by the East Bay Municipal Utility District in the San Francisco Bay Area reduced the amount of metals in treatment discharge by 70 percent.[26]

The Bay Area's "Big Stench" is no more.

California has marked other clean water successes in recent years.

Efforts to control contaminant runoff from abandoned mines have reduced water pollution in the Central Valley. A cleanup effort in summer 2007 at Abbott and Turkey Run mines stabilized 20,000 pounds of mercury that would have run into Cache Creek, and the construction of a lime neutralization treatment plant at Iron Mountain Mine reduced the amount of metals running from the mine into the Sacramento River by 95 percent.[27]

A 2006 evaluation of projects funded by the Clean Beach Initiative, which has used voter-approved bond funds to improve water quality along the state's coastline, showed that five of eight projects designed to divert stormwater runoff into sanitary sewer systems reduced bacteria at beaches. While the evaluation also found that some of the projects were not successful, it noted that millions of gallons of contaminated runoff had been removed from state beaches and that lessons learned from the projects could improve water quality in the future.[28]

Stormwater Permits

The state and regional boards both issues stormwater permits in California. Most permits are broken into four categories:

- ***Municipal program.*** For medium (100,000 to 250,000 people) and large (more than 250,000) areas, regional boards issue a permit to municipal separate storm sewer systems (MS4). Most of these permits are issued to a group of co-permittees. For example, the Los Angeles Regional Water Quality Control Board issues one stormwater permit for all of Los Angeles County, with the permit including all of the cities within the county. There are 85 co-permittees for that permit. In all, there are 26 permits issued in the state for medium- and large-sized urban areas that regulate discharges from about 300 cities, counties and special districts. For small communities, the state board has adopted one general permit that covers about 190 cities, counties and special districts.
- ***Construction program.*** The state board adopted a general permit for construction in the state that disturbs one acre or more of land. There were about 20,000 such construction sites in the state in spring 2008. Generally, the permit requires construction sites to develop Storm Water Pollution Prevention Plans and reduce pollutants using available technologies.
- ***Industrial program.*** The state board adopted a general permit that covers runoff from about 9,500 industrial facilities. Like the construction permit, industry is required to develop Storm Water Pollution Prevention Plans and reduce pollutants using available technologies.
- ***Caltrans program.*** The state board issued a statewide permit for the California Department of Transportation (Caltrans), which designs, constructs and maintains the state highway system, including bridges and tunnels. The permit requires Caltrans to develop a Storm Water Management Plan.

Also, State Water Resources Control Board. "Storm Water Program – Caltrans Program." www.waterboards.ca.gov/water_issues/programs/stormwater/caltrans.shtml.

The San Diego Regional Water Quality Control Board led an effort in early 2000 to revitalize the San Diego Marina area by removing gasoline and diesel fuel from soil and ground water. The last of five Cleanup and Abatement Orders was lifted in 2005.[29]

Current Threats

Despite these successes, the state is clearly not meeting the lofty goals of the Clean Water Act and Porter-Cologne. Examples of water quality problems abound: Several recent studies show rapidly declining numbers of pelagic fish species in the Sacramento-San Joaquin River Delta, including the endangered Delta Smelt, in part due to water quality.[30] A 2006 study of 181 private wells in Tulare County showed that more than 40 percent had higher-than-allowed levels of nitrates.[31] In one day in 2005, volunteers collected 61,117 discarded bottle caps along California's coastline.[32]

Nearly four decades after California and the federal government sought to eliminate water pollution, the state's waters still face enormous threats.

Wastewater remains a problem. Improvements in wastewater treatment are the most important legacy of water quality regulation in the country and in California, yet wastewater continues to contaminate the state's waters. Some treatment plants have chronic problems, landing them on the EPA's quarterly "Watch List" of the most troubled discharge facilities in the state. Included on the EPA's April 2008 list were 10 publicly-owned plants that have been violating conditions of their permits continually for more than two years.[33]

"There are lots of really badly maintained, undercapitalized, undermanaged systems, even in affluent areas," Alexis Strauss, director of the water quality division for US EPA Region 9, told the Commission.[34]

Underscoring her point, the EPA in April 2008 ordered seven sanitary districts in Marin County – one of the wealthiest counties in the United States – to make changes to their systems due to repeated sewage spills caused by deteriorating sewer pipes. According to the order, the Mill Valley system recorded 110 sewage spills between December 2004 and February 2008.[35]

State of the State's Waters

How clean – or dirty – are the state's waters? A dearth of water quality monitoring and the state's failure to create an accessible site for available information depicting water quality in California makes answering this question difficult. Here are three separate reports depicting the state of the state's waters:

Clean Water Act Section 305b Report. The Clean Water Act's Section 305b requires each state to assess the condition of its waters and submit the results to US EPA every two years. Using information gathered through US EPA's Environmental Monitoring and Assessment Program, the 2006 report, the most recent, focuses on assessments of two types of water in the state: coastal bays and estuaries and wade-able, perennial streams. Results included:

- The report suggests most of the state's coastal waters are in "fair" or "good" condition, based on US EPA criteria. High phosphorous levels were found in much of San Francisco Bay, while Southern California ports reported sediment chemical contamination.
- Analysis focused on the number of benthic macroinvertebrates, such as crayfish, dragonflies and snails, living in streams versus the number that would be expected to live there based on models. Overall, the report suggests 67 to 78 percent of wade-able perennial streams in California are in "good" condition.

California Water Plan. In the 2005 update of the California Water Plan, water quality conditions were reviewed by focusing on four areas: surface water; ground water; drinking water; and, environmental water, defined as the water that serves as habitat for fish, birds and other animals. The plan outlines current issues within each area:

- ***Surface water.*** Thirteen percent of the total miles of the state's rivers and streams were listed as impaired by at least one contaminant. About 15 percent of the state's lake acreage is impaired.
- ***Ground water.*** Sixty-two percent of the state's wells met standards for contaminants. In each of the state's hydrologic regions, however, 24 to 49 percent of public water supply wells exceeded acceptable levels for one or more contaminants.
- ***Drinking water.*** Public water systems in the state collect water from about 15,000 ground water and 1,000 surface water sources. About one-quarter of these sources have at least one contaminant at higher-than-allowable levels.
- ***Environmental water.*** While providing no specific measurements describing the extent of water quality impairment on riparian and aquatic habitats, the Water Plan noted that habitats can be affected by "legacy" pollutants, such as mercury.

Heal the Bay report card. The Southern California environmental group Heal the Bay has graded water quality at beaches for 18 years. The group assigns letter grades to beaches, based on monitoring data collected by local governments and dischargers on fecal indicator bacteria, considered to be the best indicator of whether beach water is safe for swimming.

In its annual report card published in May 2008, 87 percent of 379 beach locations received an A or a B. Los Angeles County recorded the lowest grades in the state, with 71 percent As and Bs. Avalon Harbor Beach on Catalina Island, ranked last, received an F.

"18th Annual Beach Report Card."

According to a 2008 US EPA estimate, California would need to spend $18.2 billion to upgrade its wastewater treatment infrastructure to meet all water quality and public health needs.[36]

Despite these needs, federal funding for improvements is waning. The initial funding program enacted with the Clean Water Act now provides far less money than it once did. In the 1970s, federal dollars paid for 75 percent of projects. Congress stopped providing grants in 1987, launching in their place a revolving loan program, which provides low-interest loans for wastewater treatment plant upgrades. Federal contributions to the State Revolving Fund have shrunk to $48 million in 2008 from $144 million in 1996, while upgrade costs have increased.[37]

Non-point sources the biggest threat. A much bigger and broader threat comes in the form of so-called "non-point sources" of water pollution, such as urban stormwater runoff, agricultural runoff and legacy pollutants, all of which are diffuse and have no single pipe or source to control. Non-point source pollution is responsible for 76 percent of California water impairment.[38]

Non-point sources were largely ignored as a source of pollution in need of regulation during the first decades of the Clean Water Act and Porter-Cologne. But as point source pollution diminished and many water bodies remained impaired, attention turned to non-point sources. The Clean Water Act was amended in 1987 to include non-point sources in the NPDES permitting program.

Non-point sources are much more difficult to regulate for obvious reasons. The pollution is diffuse and difficult to trace to its sources. Its episodic nature makes non-point sources of water pollution even more difficult to monitor and assess.

Water quality experts note that non-point source regulation, unlike point source regulation, is still a relatively new process and that effective programs, funding sources and scientific understanding have not been fully developed.

Stormwater. Rain storms sweep debris and pollutants from roads, parking lots and other impervious surfaces that dominate city landscapes into waterways, creating pollution in creeks, rivers, lakes and the ocean.

In essence, modern life is the source of stormwater pollution. Urbanization has led to more paved, impervious land and more complex water pollution problems with unusual and hard-to-regulate sources. Land use decisions that increase the amount of non-permeable surfaces in a city, for example, lead to more runoff. Studies conducted in the San Francisco Bay have found that copper from automobile brake pads, which falls from brakes onto streets and then is washed into storm drains during rain events, is a major source of pollution in the Bay.[39]

Many of the most complicated and contentious issues facing water boards and the entities they regulate involve urban stormwater. Stormwater permits affect an enormous percentage of the population: More than 30,000 stormwater discharges are subject to permits, covering every populous area of the state, compared to only 2,200 wastewater permits.[40]

Financially-strapped local governments complain that stormwater requirements eat up money that could be spent on police protection, social services and other local priorities. One study found that stormwater programs cost local governments between $18 and $46 per household annually.[41]

Despite these difficulties, it is clear that stormwater pollution must be dealt with. One recent study noted that metals from stormwater increased from 6 percent to 34 percent of the total metals pollution in water along the Southern California coastline between 1971 and 2000.[42]

Modern water regulators face this central dilemma: Urban development for decades has focused on collecting stormwater and conveying it quickly away from homes and other buildings to prevent flooding. The concrete channels throughout the Los Angeles County basin direct 500,000 acre-feet of stormwater into the ocean every year, for example.

Stormwater managers must develop strategies that in many ways run counter to those designed to prevent flooding. To protect the ocean and other water bodies from the lawn fertilizers, pet waste, pesticide, oil, grease and trash that is flushed from city streets by rain, a key solution is to retain stormwater so that the soil catches contaminates as the water percolates into the ground. Other strategies to address stormwater pollution include, cleaning streets, changing individual behaviors such as over-fertilizing lawns, or treating stormwater in a similar manner to treating wastewater. The state and regional water boards, through their permitting process, seek to require cities, industries, construction activities and the state's highway system to change practices to limit runoff and prevent contaminants from reaching streams, rivers and bays.

For much of the short history of stormwater regulation, rules have emphasized effort over outcomes. The Clean Water Act's 1987 amendment regarding stormwater requires cities and other regulated entities to reduce stormwater pollution to the "maximum extent possible," but Congress never defined that term. Typical stormwater permits have required cities to develop and submit plans explaining their efforts. The vagueness surrounding the regulation is in contrast to wastewater regulation, which typically provides treatment plants with numerical limits for certain contaminants.

Some water users noted the differences in the way Congress treated point sources and non-point sources: When the Clean Water Act was approved in 1972, Congress gave states specific direction to require numeric limits in permits, and the federal government provided significant funding through a grant program to improve wastewater treatment facilities. Through the 1987 amendment, the grant program became a loan program, and Congress did not require numeric limits in permits regulating cities.

"With point sources, Congress provided both a carrot and a stick," Mark Gold, president of Heal the Bay, said. "With non-point sources, there is neither a carrot nor a stick."[43]

Disagreements now abound over many stormwater programs. It is more difficult to monitor, and more difficult to determine whether specific programs are effective. A blue ribbon panel of experts convened by the State Water Resources Control Board noted in a 2006 report that both regulated entities and environmental groups complained that stormwater permitting "has become overly complex, and that it is extremely difficult, if not impossible to objectively determine if a facility, operation or municipality is in compliance with permit requirements."[44]

During the Commission's study process, the National Research Council published a lengthy and damning report on national stormwater policy, essentially declaring it a failure. "EPA's current approach to regulating stormwater is unlikely to produce an accurate or complete picture of the extent of the problem, nor is it likely to adequately control stormwater's contribution to water body impairment," the report strongly states.[45]

To improve effectiveness, California's water boards are attempting to place more numeric limits or measurable requirements into stormwater permits, which is creating conflict with many stakeholders. Regulated entities complained to the Commission that the boards were using standards adapted for point sources in their efforts to better regulate stormwater.

This dilemma must be addressed by the state as it works toward improving water quality and water supplies in the future. Many argue that stormwater should not be treated as a problem, but as a resource. Captured and treated stormwater could be reused. The state's water future – in which recycled water must play a larger role – may in part depend on improving stormwater strategies.

Irrigated agriculture and dairies. In rural areas, runoff from agriculture and dairies plays a role in water pollution. Studies show that nitrates, often linked to farming practices, are affecting drinking water in parts of the Central Valley. A 2007 report issued by the Central Valley Regional Water Quality Control Board summarized more than two years of monitoring and found, among other things, toxicity to algal species throughout the valley that is generally associated with herbicides and metals, such as copper, and sediment toxicity throughout the valley likely due to certain types of pesticides.[46]

In part due to legislation enacted in 1999, regional water boards have begun to increase regulatory authority over irrigated agriculture, which is exempt from the Clean Water Act. The two regions with the most agricultural activity both have adopted conditional waivers of waste discharge requirements in the past five years that affect agricultural practices. Farmers are required to agree to the conditions of the waiver or face an individual waste discharge requirement.

The Central Valley Regional Water Quality Control Board oversees about 7 million acres of cropland, while the Central Coast Regional Water Quality Control Board regulates a much smaller area – about 600,000 acres.[47] The two boards take somewhat different approaches to regulating water quality in their districts, based in part on their sizes.

The Central Coast board requires farmers to participate in water quality education classes, participate in monitoring efforts and file regular reports with the board detailing activities geared toward improving water quality. The Central Valley board requires farmers to participate in – and fund – coalitions that perform monitoring. Based on that monitoring, the coalitions prepare management plans to address problem areas. Individual farmers are not required to submit reports as they are in the Central Coast region. The Central Valley board has found some difficulty in ensuring that all agricultural operations required to join a coalition do so – they have issued more than 1,400 enforcement orders requiring non-participating landowners to do so.[48]

While the Central Coast's irrigated agriculture program includes operators that discharge into ground water, the Central Valley program only includes those who discharge to surface water.[49]

In May 2007, the Central Valley Regional Water Quality Board issued a Waste Discharge Requirement covering all dairies in the region in existence since October 2005 – about 1,600 operations. Most of the dairies that operate in California are located in the Central Valley region, and before the new requirements, most had not been regulated. This had led to problems – a study of 425 wells at 88 dairies found that 63 percent of dairies' water was contaminated by nitrates.[50] The new order requires dairies to prepare reports on how they handle animal waste and other potential contaminants and monitor ground water quality. Dairy operators must enroll in a class designed to teach them how to comply with the new regulations.

Dairy representatives estimate the new regulations will cost each dairy $30,000 to $36,000 each year and require them to change business practices.[51]

Environmental groups argue that the regulations are long overdue and do not go far enough to successfully address the contamination. They note, for example, that the regulations contain no numeric limits or enforcement provisions. Two groups, the Environmental Law Foundation and Asociacion de Gente Unida por el Agua, have sued the state board over the regulation. The lawsuit remains pending.[52]

Legacy Pollutants. Another threat to the state's waters is so-called legacy pollutants, or pollution that stems from historic practices. These pollutants stem from agriculture, manufacturing and mining activities that have been banned or are no longer practiced. Legacy pollutants' historical nature pose a significant challenge for regulators: It is often impossible to hold former dischargers accountable, and removal of contaminants can be difficult and costly.

Major legacy pollutants include:

- ***Mercury.*** Used in 19th century gold mining practices in the Sierra Nevada mountains, mercury is now a prevalent contaminant in the Central Valley and San Francisco Bay regions. A study released in September 2008 showed that while some contaminants in sport fish declined during a 30-year period, mercury levels in fish remained relatively constant.[53]
- ***Polychlorinated Biphenyl (PCBs).*** PCBs were used in numerous products until they were banned in 1979, after they were identified as causing cancer in humans and disrupting animal reproduction. Despite the ban, PCBs linger and remain at high levels in San Francisco Bay and some Southern California lakes.[54]
- ***Perchlorate.*** Perchlorate, used in rocket fuel in the last half of the 20th century, has contaminated water in Sacramento County and Southern California, mostly in areas formerly used by the United States Department of Defense and the National Aeronautics and Space Administration. The Central Valley, Santa Ana and Los Angeles Regional Water Quality Control Boards have worked with industry and the federal government to control and remove perchlorate.

The Challenge Going Forward

California ushered in state-governed water quality protection with the passage of the Dickey Act in 1949, which set a regional course for regulation. The sweeping ambition of the Porter-Cologne Act in 1969 raised expectations that the state could eliminate water pollution, and established the principles for how California would regulate point source discharges. It made clear that discharge was a privilege, not a right, that solutions had to strike a reasonable balance between environmental protection and other concerns, and established basin plans as the foundation of regional regulation.

At the federal level, the similarly ambitious Clean Water Act followed in 1972. In its first incarnation, it attacked point source pollution such as industrial discharges and wastewater treatment. The act has evolved to focus on non-point sources and developing solutions for impaired water bodies, most notably total maximum daily loads for identified contaminants. This new focus has not come with the same level of federal funding that was available in the 1970s and 1980s, however.

Water Board's Efforts to Improve Programs, Processes

To their credit, the state water board has made several recent efforts to improve its programs and respond to criticism. Examples of the boards' reform efforts include:

- ***Strategic Plan Update.*** Adopted in September 2008, the water boards' Strategic Plan Update 2008 – 2012 outlines priorities for the water boards, both in terms of clean-water outcomes and in improving processes. The plan calls for the boards to prioritize programs for important watersheds, such as the Klamath River basin, for example, and prioritize needed basin plan updates. The plan also addresses concerns involving transparency and consistency, and calls for the development of state and regional water board work plans that include ways to measure performance. The plan has numerous specific goals with dates these goals will be achieved that will allow the Legislature, governor and stakeholders to assess board effectiveness. The plan was adopted after a one-and-a-half-year span that allowed significant stakeholder and staff input.
- ***New Offices.*** During the past two years, the state water board has created new offices within the board to improve effectiveness. The Office of Information Management and Analysis is intended as a way to improve both the boards' information technology systems and its ability to provide the public with useful information. The office was created on July 1, 2008 and oversees IT systems such as California Integrated Water Quality System (CIWQS) and also will produce routine reports depicting water board activities and outcomes. The Office of Research, Planning and Performance was created in 2006 to help better coordinate scientific research, work on strategic planning and develop performance measurement targets to help improve accountability within the water board system. The Office of Public Participation was created in 2007 to help strengthen the boards' efforts to involve the public in decision-making processes.
- ***Expert Panels.*** The state board has used panels of experts to review failing programs and make recommendations for change. In two cases, the reviews have helped the board make improvements to critical programs – the CIWQS and the Surface Water Ambient Monitoring Program (SWAMP) – that needed extensive restructuring. Both reviews were facilitated by Stephen Weisberg of the Southern California Coastal Water Research Project. In both cases, initial reviews of the programs – made public by the state water board – provided a harsh assessment of the programs but offered clear direction to make changes. For example, the review of CIWQS found that bifurcated management of the system and a broad, overly complex scope set the system up for failure. In both cases, a second review conducted about a year later showed significant improvement.
- ***Water Quality Improvement Initiative.*** Unveiled in May 2008 by the Schwarzenegger administration, the Water Quality Improvement Initiative was a comprehensive legislative proposal to reform some aspects of the water boards. The initiative called for the creation of a water quality council comprised of the chairpersons of each regional board to help improve consistency, and for the state and regional boards to establish priorities and report regularly to the Legislature on whether those priorities had been met. In addition, the initiative would change the state's interpretation of the 10 percent rule to allow potential appointees to serve on a board as long as they do not have income from an entity permitted by that specific board. Other proposals include delegating permitting authority from the regional boards to the regional board executive officers to allow the regional boards to focus on broader policy issues. In all, the initiative contained more than a dozen proposals for change.

California's main regulatory tools to enforce its clean water laws are the State Water Resources Control Board and nine regional water quality control boards. The state board sets policy and oversees the regional boards. The regional boards, which largely act independently of each other, develop basin plans and issue permits, monitor the results and assess fines when necessary. To a great degree, their structure and their policies reflect the major water protection laws passed in 1949, 1969 and 1972 with their heavy emphasis on point source pollution.

These laws have significantly reduced much of pollution that plagued California in the 1960s and 1970s, especially water contamination from point sources. But with the state's continued economic and population growth over the decades, some problems, such as sewage discharges, still escape a complete solution, in some cases because of cost. Other problems have emerged that defy easy solutions, such as stormwater runoff and agricultural runoff, as well as legacy pollution from old mines or contaminants from now-banned industrial practices. They now represent the biggest challenges California and its water boards face in living up to its commitment to provide clean water to its people now and in the future.

An Outdated System

Enacted in 1969, the Porter-Cologne Water Quality Control Act placed California in the vanguard of environmental protection.

In recent years, however, the water quality regulatory system developed nearly four decades ago is showing signs of its age. The system has not adapted to address modern water quality issues. Pollution from sources such as urban stormwater and agricultural runoff is now the biggest threat to surface water and groundwater. Legacy pollutants, such as mercury from mining practices, as well as aerial deposition from automobiles and other sources, also contaminate water. The traditional system of issuing permits to dischargers and monitoring those dischargers is not well-equipped to handle complicated issues that involve land use, diffuse pollution sources and complex scientific inquiry.

Regional boards are overwhelmed. Basin plans, the key regulatory document for each region, are decades out of date. Priorities are not matched to the most important threats to water quality. Process trumps a focus on clean water outcomes. Volunteer regional board members face increasingly difficult decisions that require a sophisticated understanding of water science and have profound ramifications for both the environment and the economy. Transparency, a key tenet of democratic government, is missing in regional board processes, as stakeholders complain they have little ability to interact with board members and do not always understand the rationale behind decisions. Regional boards across the state have differing philosophies and processes, and the state board has not adequately exercised its authority to ensure that the boards operate as one state agency, rather than 10 separate entities. Though the system is set up to protect water for the people of California, it is virtually impossible for the public to find easy-to-understand information on water quality in the state.

The result is a troubled system that lacks credibility with stakeholders, ranging from environmentalists to regulated businesses and local governments to the Legislature. In a disturbing illustration of the mistrust between the water boards and the water community, several stakeholders declined to publicly testify to the Commission about the boards because they were concerned there would be reprisals for publicly airing their complaints.

Worst of all, it is difficult to determine if the boards' regulatory programs are effectively cleaning and protecting California's waters. Many argue they are not.

"During the past 15 years, we have flat-lined in the effort to protect water quality," argues LaJuana Wilcher, a former administer with US EPA who advocates for a nation-wide overhaul of water quality regulatory practices.[55]

Cities of Arcadia, et al. vs. Los Angeles Water Board

Litigation involving 21 municipalities in Los Angeles County, the Building Industry Association (BIA) and the Los Angeles Regional Water Quality Board illustrates the difficulties boards are having regulating stormwater with out-of-date basin plans.

In 2004, as the Los Angeles board was conducting a triennial review of its basin plan, the cities and BIA asked the board to review its water quality standards in relation to stormwater regulation. Sections 13000 and 13241 of the Porter-Cologne Water Quality Control Act require the boards to enact standards that "attain the highest water quality which is reasonable," and the boards must consider several factors, such as probable beneficial uses of water, environmental characteristics of water, water quality conditions that could be reasonably achieved, and economic considerations, when it sets standards. The regulated entities argued that the basin plan's standards were developed before stormwater regulation was in place, and that due to stormwater's unique nature, new standards should be developed and applied in stormwater permits and during the TMDL process.

The board did not review the standards, arguing that the standards were adequate because the boards had considered the reasonableness factor and other factors when they were first developed. The state board approved the 2004 basin plan and declined to hear a petition for review from the regulated entities. In 2005, the group sued the board in state superior court, arguing that both stormwater permits and TMDLs were based on water quality standards set without consideration of stormwater issues. According to the lawsuit, the cities projected needing to spend several billion dollars complying with numeric limits on trash and trace metals as part of two TMDLs that were enacted based on existing water quality standards.

In July 2008, Judge Thierry Patrick Colaw sided with the plaintiffs, concluding that during the creation of the original basin plan and subsequent revisions, "there is no substantial evidence in the record to show that the boards have ever analyzed the 13241/13000 factors as they relate to stormwater." Colaw ordered the Los Angeles water board, and the State Water Resources Control Board, which has ultimate authority over the basin plans, to review water quality standards in the Los Angeles basin plan as they relate to stormwater.

The order created angst and confusion in the region, as the state board concluded that it could not authorize any new activity, including construction and industrial activities, until the matter was resolved. The judge later allowed the water quality standards to stand while the board conducted its review, and thus construction and industrial activity were allowed to resume.

But the lawsuit reveals what many stakeholders told the Commission: Stormwater regulation has been developed during the past 20 years based on standards that were largely created before nonpoint source water pollution was even considered. Other regional boards also have basin plans and water quality standards that were developed for point sources but are now being used in stormwater regulation.

Sources: Porter-Cologne Water Quality Control Act, sections 13000 and 13241. State Superior Court Judge Thierry Patrick Colaw. July 2, 2008. Judgment, Cities of Arcadia, et. Al. vs. State Water Resources Control Board and Los Angeles Regional Water Quality Control Board. Michael Lauffer, Chief Counsel, State Water Resources Control Board. July 16, 2008. Memo to Dorothy Rice, Executive Director, State Water Resources Control Board. State Superior Court Judge Thierry Patrick Colaw. August 28, 2008. Order, Cities of Arcadia, et. al. vs. State Water Resources Control Board and Los Angeles Regional Water Quality Control Board.

Through two public hearings, meetings of two Commission-created advisory committees, extensive interviews with stakeholders and a review of existing research, the Commission identified the following critical problems with California's efforts to improve and protect water quality:

- ***The relationship between the state and regional boards is not well-defined, leading to inconsistencies and inefficiencies among boards, an inability to set statewide priorities and a lack of focus on holding regional boards accountable for clean water outcomes.*** In statute, the state board has significant authority to steer regional board policies and provide statewide leadership. In practice, however, the state board does not provide enough oversight and regional boards have dramatically different approaches to similar problems, statewide priorities are unclear and there is not enough effort to understand which regional boards are the most effective at implementing clean water laws.
- ***The state and regional boards lack mechanisms to collect and analyze data properly, use scientific research and cost-effectiveness reviews to drive decision-making and provide useful information to the public, policy-makers and other researchers.*** Regional boards acknowledge they do not always have sufficient data to make decisions or determine whether programs are working. The state has struggled to implement an information technology system and coordinate scientific research so that it is applied in regulatory processes. Basin plans, the key regulatory document dictating most regional board processes, are out of date in most regions.
- ***An antiquated regional board structure and poor appeals process limits candidates for regional boards, hinders transparent decision-making, and asks volunteer board members to do too much.*** Regional boards face complex decisions that require water expertise that some board members do not have. Compounding that difficulty are ex parte rules that limit board members' ability to communicate with stakeholders, who in turn feel they are not able to work with boards in a collaborative manner. Federal and state conflict-of-interest provisions dramatically limit the pool of potential qualified candidates. And few stakeholders have confidence in the appeals process.
- ***The state – both water boards and other state agencies – is struggling to adapt appropriate strategies to address non-point source pollution.*** Non-point source pollution provides enormous challenges to the state and will require multi-

agency responses, but the state has no structures in place to address water quality problems that stem from land use, centuries-old pollution and air pollution. Urban stormwater is a vexing problem with costly solutions, yet the state has not developed an adequate system for assessing and prioritizing this problem and other non-point source pollution problems.

Inconsistencies and Inefficiencies

The framers of California's water quality regulatory system envisioned a decentralized governance structure that would lead to different objectives and standards in different regions. That is appropriate, as different regions have different hydrological conditions, and a contaminant may impact one water body differently than another.

But numerous stakeholders suggested that too often, regional board policies and processes vary dramatically, even on some of the most important statewide water issues. Examples include:

Water recycling. The Legislature in 1991 declared its support for increasing water recycling in the state by calling for the state to use 700,000 acre-feet of recycled water by 2000 and 1 million acre-feet by 2010. The 2000 goal was not met, and many believe the 2010 goal will not be met either.[56] Regional boards play a critical role in water recycling projects because reused water is often injected into ground water basins, giving boards authority to regulate that discharge. Boards have taken widely different approaches to recycled water projects; in fact, all boards do not offer the same type of permits for recycled water, with some issuing a NPDES permit and others regulating projects through water reclamation requirements.

"Inconsistent regulation of water recycling by state and local officials leads to confusion and uncertainty in how to design and manage water reuse systems and appears to have led to overly restrictive regulation and added costs, creating an obstacle to achieving the full potential for water reuse," a 2003 report on water recycling noted.[57]

The state board noted in 2007 that, "Regional Water Boards have established varying requirements for recycled water used for irrigation. Some have established limitations for salts in recycled water and others have not. Some water recycling irrigation projects have ground water monitoring requirements, but most do not."[58]

This can have profound effects: Los Angeles spent seven years working with the Los Angeles Regional Water Quality Control Board to obtain a permit to use recycled water for landscape irrigation purposes such as watering golf courses.[59] This frustration led to legislation in 2007 to allow entities seeking water recycling permits to bypass regional boards and obtain a permit from the state water board instead.[60]

The state board is currently working on the creation of a statewide policy on water recycling.

Stormwater. Stormwater policy also varies widely from board to board. The Central Valley board issued a relatively brief stormwater management permit (62 pages) for the city of Stockton in December 2007 that required the city to determine its own best management practices to address stormwater cleanup. By comparison, the Los Angeles board issued a draft stormwater management permit to Ventura County in August 2007 that was nearly twice as long (115 pages) and far more specific about the tasks the county and cities within the county should perform and the numeric limits on specific pollutants in stormwater. The permit listed specific best management practices that could be used and detailed how often streets should be swept.[61]

"Instead of a statewide plan and comprehensive approach to stormwater, precedents are being set, conditions for permits are being imposed and numeric limits are being imposed in a fragmented, case-by-case manner," said Terese Ghio, past president of the Industrial Energy Association.[62]

The California Stormwater Quality Association, a group including local government stormwater managers and private consultants, has been advocating for several years that the state board develop a comprehensive stormwater policy for medium- and large-size cities that they argue would improve the effectiveness of stormwater regulation and better allow measurement of that effectiveness. So far, however, the state board has not taken that up.[63]

Thus, regional boards have radically different approaches to stormwater regulation, one of the most difficult and contentious water pollution issues facing the state.

Monitoring, reporting and other processes. How regional boards develop information and report water quality data also differs. A 2006 report reviewing the state's Surface Water Ambient Monitoring Program – which is intended to gather and report statewide information on water quality – outlined several notable inconsistencies among regions. The review found, for example, that the North Coast Regional Water Quality Control Board and the

Central Valley Regional Water Quality Control Board appeared to be compiling their lists of impaired water bodies differently, with the North Coast region declaring much larger swaths of water bodies impaired, while the Central Valley board listed much smaller segments. The result makes it difficult to compare impaired water bodies in the two regions. The report also noted that bioassessment tools – used to help determine the health of a water body – had been developed differently by different regional boards.[64]

A report published by the State Water Resources Control Board in 2006 depicting water quality across the state noted that regional board water quality "assessments cannot be successfully integrated into an accurate statewide report because regions use a variety of assessment approaches and do not always apply criteria consistently."[65]

A US EPA review of inspection and enforcement activities by regional boards noted that it was difficult to compare regions because inspection reports and permit compliance reviews were done differently in different regions. "The documentation was not standardized across the RWQCBs (Regional Water Quality Control Boards) or the various water programs," the EPA noted.[66]

While the state water board's newly-created Office of Information Management and Analysis is attempting to improve the board's use of data and coordinate data gathering and reporting, inconsistent approaches to monitoring and data gathering limit the ability of the public and policy-makers to determine the health of the state's waters and whether various state strategies to improve water quality are effective.

Mark Lubell, an assistant professor in the Department of Environmental Science and Policy at the University of California, Davis, said he had attempted to study whether one of the state's main thrusts on water policy – gathering local water interests together to develop long-term water resource plans, referred to as Integrated Regional Water Management Planning – was protecting water quality. He found that due to different data gathering and monitoring in different watersheds, it was impossible to compare different water bodies in a meaningful way. Thus, he was unable to determine whether a major statewide initiative – one that has consumed hundreds of millions of dollars – is effective.[67]

Inconsistencies among boards also lead to inefficiency and expense. The Riverside County Flood Control and Water Conservation District reported that it spent nearly $2 million during a five-year period preparing three different sets of reports and permit applications because the three regional boards overseeing pieces of the district all required different paperwork.[68]

The state board can address regional inconsistency in multiple ways, including through rulings on appeals. The most effective avenue, however, would be through state board policies, which are intended as guidelines for all regional boards to follow. Currently, there are only 16 statewide policies.

State board officials complain that enacting policies is a long, staff-intensive process. Because some policies require scientific research, policies can take several years to develop. In addition, the state board is required to follow California Environmental Quality Act processes, which often take a year or longer.

Little Focus on Outcomes or Accountability

Are regional board permits, enforcement actions and other programs working to protect and improve California water quality? It is difficult to say.

Throughout the review process, the Commission found an alarming lack of information on the effectiveness of state water quality regulations. Regional boards submit a significant amount of data to the state board, from lists of impaired water bodies to work plans outlining upcoming plans, but there is not enough analysis done by the state board to determine program effectiveness. The state board does not provide enough leadership in directing regional board activity based on analysis of what is working, and what is not working.

Too much discussion within the boards – and among stakeholders – is focused on processes; not enough attention is paid to whether these processes lead to the desired clean-water outcomes.

Examples include:

- In a report summarizing current water quality monitoring practices and suggesting changes, an executive of the San Diego Regional Water Quality Control Board noted that monitoring and surveillance information and analysis was not integrated into board programs, with the result being “the Regional Board is unable to efficiently assure discharger compliance with regulatory requirements and effectively measure the performance and success of its own regulatory activities."[69]

- In a 2008 report detailing enforcement activities of the boards, the state water board noted that the boards do not track the environmental benefits of enforcement actions, such as the amount of pollutants reduced in water or the acres of wetlands or beaches restored. "This information could be collected when the enforcement case is resolved," the report notes. But it currently is not.[70]

There are numerous reasons for the lack of focus on outcomes.

Reviews by US EPA of water board practices are influential in directing the boards' activities, due to US EPA's authority over Clean Water Act activities. Many of US EPA's reviews of California measure the boards' processes and outputs, not outcomes. For example, most of what US EPA measured in its 2007 "Enforcement and Compliance Assurance State Review Framework" report for California focused on processes, such as data inputs, penalties assessed and timely reporting, instead of environmental outcomes.[71]

In addition, board members, staff and stakeholders argue the boards simply do not have enough resources to ensure programs are working. Regional monitoring, which allows boards to take a broad look at the health of a watershed, is under-funded. Regional monitoring is done in addition to self-monitoring conducted by permitees to ensure they comply with conditions of their permits, and is usually funded through the General Fund, not user fees. An advisory group formed by the state water board produced a report in 2000 with recommendations for surface water monitoring that suggested it would cost between $59 and $115 million annually to conduct a comprehensive monitoring program.[72] In the eight years since, funding has never reached that level. In the 2007-08 fiscal year, the state and regional boards spent about $9.5 million, or about 16 percent of the minimum amount recommended – on ambient monitoring.[73]

In some instances, court cases also create pressure to focus more on processes than outcomes. A 1999 settlement between environmental groups and the US Environmental Protection Agency has forced the Los Angeles Regional Water Quality Control Board to develop 92 total maximum daily load plans in 13 years, and a 1997 settlement set up an 11-year schedule for the North Coast Regional Water Quality Control Board requiring two TMDLs per year.[74] Some stakeholders argue that the tight timeline has led regional boards to quickly adopt

TMDLs without adequately determining whether they will have a positive impact on water quality.[75]

Regardless of these pressures, stakeholders with numerous different perspectives complained to the Commission that a lack of focus on outcomes has led to a lack of accountability for regional boards. Local government officials and business interests subject to stormwater permits argue that some regional boards' zeal to regulate leads to too-stringent requirements, which should be reined in by the state board. Environmentalists argue that the state board does not do enough to ensure that regional boards are conducting timely enforcement actions to ensure that regulated entities are not fouling the state's waters in violation of their permits.

Regional boards differ considerably in their enforcement activities. A 2008 state board report on enforcement noted a wide range in the percent of violations that received enforcement among the regional boards, with one board pursuing only 30 percent of violations and another pursuing 97 percent. The report noted that the "variation in enforcement actions reflects differing emphasis on enforcement at the Regional Water Boards."[76] There was no further discussion or analysis as to why that was, or whether one region or another was performing more effectively.

In her testimony to the Commission, Linda Sheehan, executive director of the California Coastkeeper Alliance, referred to that report as an example of the state board's reluctance to hold regional boards accountable for their actions. Sheehan said the report did not delve further into reasons why regional boards' performance on enforcement varied. "Under its current authority and structure, the state board can and must – but generally fails to – call out under-performance at the Regional Board level," she said.[77]

Funding Constraints Limit Programs

While offering many different perspectives on various problems facing the water boards, stakeholders and board officials were virtually unanimous on one issue: They argue there is not enough money made available to accomplish the state's clean water goals.

An unmet needs analysis performed by the state water board in 2001 found that the state and regional boards would need 260 percent more funding than they were receiving to fully carry out current duties and future duties based on emerging issues. The Legislative Analyst's Office concluded that the assumptions made by the state board in determining unmet needs were reasonable. The report noted the following staffing deficiencies:

- ***NPDES wastewater program.*** While the state and regional boards need 233 staff, there are about 100.
- ***NPDES stormwater program.*** While the state and regional boards need 400 staff, there are about 100.
- ***Wetlands and 401 certification.*** While the state and regional boards need 134 staff, there are 16.
- ***Waste Disposal Requirement program.*** While the state and regional boards need 290 staff, there are 77.
- ***Land disposal program.*** While the state and regional boards need 164 staff, there are 70.

This lack of staff hinders the boards' abilities to perform duties. A Legislative Analyst's Office report found that more than one-fourth of major wastewater treatment facilities had permits that had expired because regional boards had not updated them. In addition, until the summer 2008, the water boards had yet to assess fines for 9,592 mandatory minimum penalty violations that occurred between 2000 and 2007. While a state board effort begun in summer 2008 is attempting to address the fine backlog, this lengthy period between violation and actual fine limits the deterrent effect that prompt enforcement actions might have.

The boards are funded largely through fees and other non-General Fund sources. In the water boards' budget for the 2008-09 fiscal year, for example, only $38.7 million of the boards' $733.1 million budget came from the General Fund.

While the boards have the authority to raise fees to meet program costs, they cannot raise fees above the amount set in the budget every year by the Legislature and governor. In other words, the governor and Legislature would have to agree to dramatically raise fees if they wanted to increase staffing to the levels called for in the water boards' report. Policy-makers have been unwilling to do so.

In its budget analysis in 2008, the Legislative Analyst's Office recommended a new fee for all water users to pay for water board programs, suggesting that a fee of less than $10 on every water utility hookup in the state would raise nearly $20 million for the boards.

Written testimony to the Commission.

Boards Unable to Prioritize

California has no current mechanism to appropriately prioritize water quality problems and steer resources toward the solutions to those problems.

Faced with a broad mandate to protect all of the state's waters, the water boards have been unable to focus on the most important water bodies or the most pressing contamination problems. Testimony to the Commission largely centered on urban stormwater issues, which has a dramatic impact on local government and business, as well as the environment. Should addressing stormwater be the boards' top priority? Many argue it should, but the state board has not indicated that it is, or should be, its top priority.

There are true impediments to prioritization. The boards' increasing reliance on fees limits their ability to match resources to needs, for example.

California's water boards have an annual budget of more than $700 million, with most money coming from fees and other non-General Fund sources.[78] Board activities are funded by 74 separate revenue streams, which are often fees assessed for specific programs.[79]

"Our actions are very much budget-driven," Karl Longley, chairman of the Central Valley Regional Water Quality Control Board, told the Commission. "The money is typically in an account and cannot be used outside of that account or for other purposes. If there was a mechanism for the executive officers and the boards to redirect resources given proper justification, it would allow us to be more diligent in addressing priorities."

Critical activities such as basin planning, enforcement and ambient monitoring, all funded through the state General Fund, received less money for staff than did other activities, even those that could be considered a lower priority.

Aside from administration, for example, staffing levels for the water boards' underground storage tanks program are the highest of any program overseen by the boards. The program regulates gas stations and other facilities that store potential contaminants underground, and is paid for entirely by fees from regulated businesses. At one time, leaking underground storage tanks were a major problem in the state. However, increased regulation has lessened the threat: The

Staff May Be Too Concentrated in Sacramento

About 45 percent of the state and regional water boards staff works for the state board in Sacramento. Some stakeholders suggested the boards could re-allocate some staff to improve regional board performance.

"… in many key areas, personnel are congregated at the state board, rather than on the ground in the regions, where the vast majority of actual permitting and enforcement is taking place,'' Linda Sheehan, executive director of the California Coastkeeper Alliance, told the Commission in her testimony.

According to water board budget year 2008-09 information provided to the Commission, for example, 42 percent of the water boards' enforcement staff and 45 percent of the boards' basin planning staff work for the state board.

During difficult financial times when the water boards should not expect new monies from the General Fund, the boards could look at deploying some staff in Sacramento to regional boards.

Sources: Linda Sheehan, Executive Director, California Coastkeeper Alliance. April 24, 2008. Written testimony to the Commission. Page 2. State Water Resources Control Board. November 24, 2008. "Budget Information for Little Hoover Commission, FY 08-09." Provided to the Commission.

number of active cases involving leaking underground storage tanks has fallen dramatically in the last 12 years, from 20,177 in 1995 to 11,899 in 2007.[80] Despite the change, the state and regional boards still have nearly 200 staff assigned to the program – far more than those working on stormwater permits, enforcement activities or even TMDLs.

The underground storage tanks program may warrant as much staffing as it receives. The boards do not conduct routine studies of their staffing and programs to determine whether staffing levels and priorities match.

Water users and environmentalists complain that the boards are not focused on addressing the state's biggest water quality issues or realistically solving problems.

In the foothills of the Sierra Nevada, for example, a small sanitation district with a treatment plant that serves 83 people faces a $574,000 fine for violations of its NPDES permit for minor discharges into a creek bed that is dry most of the year. The sanitation district may need to spend more than $4 million upgrading the facility, despite a letter from the state Department of Fish and Game that the fish the board's regulations are trying to protect do not live in the creek and a letter from the state Department of Public Health noting that the "current degree of treatment is adequate to protect public health."[81]

In Los Angeles, local governments complain that they face expensive wastewater treatment upgrades because the Los Angeles Regional Water Quality Control Board continues to require that effluent in Ballona Creek, which is a fenced-off, concrete-lined channel, be treated to allow for swimming and other forms of contact recreation.[82]

In the Central Valley, an effort to establish a total maximum daily load (TMDL) for methylmercury is focused on reducing mercury in the current discharges of wastewater and stormwater systems, despite studies showing that 75 to 80 percent of the mercury in the Sacramento-San Joaquin River Delta is not coming from those discharges. The mercury pollution is a result of mining practices dating to the 1800s. Regulated entities there argue they may be forced to spend millions of dollars upgrading their systems even though the upgrades are not likely to result in a dramatic reduction of mercury in the water.[83]

Meanwhile, environmentalists note that non-dairy feedlots, such as those for cattle, which have the potential for causing major water quality damage, go unregulated in the Central Valley. And until an effort was initiated in summer 2008, the regional boards had levied more than 700 penalties during the previous eight years that had gone uncollected.[84] By not pursuing penalties in a timely manner, the deterrence affect that might come from enforcement efforts is lost.

Stakeholders told the Commission that the boards often are too narrowly focused on regulatory programs to work on larger solutions to the state's most pressing water quality problems, such as legacy pollutants, urban stormwater and agricultural runoff.

"There have not been enough forward-looking policies in the last decade," said Craig Wilson, an attorney representing the dairy industry and the former chief counsel of the State Water Resources Control Board. "The boards have been bogged down in minutia."[85]

One problem may be that the boards actually engage in too many prioritization processes. A 2008 report for the Ocean Science Trust intended to help the boards increase the use of science in decision-making noted that the "water boards prioritization processes are complex and numerous." The report listed six different activities or processes that the boards routinely conduct to set priorities.[86]

The state board made an effort to begin infusing prioritization into its system in 2008 with the adoption of a new strategic growth plan. The plan calls for prioritizing TMDL implementation in important watersheds such as the Klamath and Bay Delta, for example.

Struggling with Information Technology

One of the most profound problems facing California's water boards is its inability to develop information technology systems that can improve efficiency and provide better information to the boards, the public and policy-makers. Gathering data and using it to produce useful information is a key job of the water boards: There are at least 25 provisions in state statutes requiring the water boards to accumulate and produce information about water.[87]

Some of the best and easiest-to-use information about state water quality is produced not by the state, but by other interested groups. The California Coastkeeper Alliance has created on its Web site an interactive map showing the state's impaired water bodies using data culled from the state water board. The state does not have any similar maps on its Web site. Heal the Bay, a Southern California-based environmental group, produces weekly report cards on beaches across the state using monitoring information gathered by the water boards and local governments. The president of the group said that occasionally water board staff ask his group for data because it is better organized.[88]

Much of the monitoring data submitted to the regional water boards is still not electronic, and databases are not well organized. A 2006 report on a water board program designed to protect wetlands areas noted that when researchers sought to review 429 files regarding the program, they could only locate 257. More than 40 percent of the files could not be found.[89]

The state board's central information technology system, the California Integrated Water Quality System (CIWQS), has had a troubled history. CIWQS has been criticized by both the Legislative Analyst's Office and an independent review panel as unreliable, difficult to use and responsible for data-entry backlogs throughout the system.

"The State Water Board has a less functional system for water quality management than it had before CIWQS was implanted," the independent review panel concluded in a July 2007 report.[90]

The LAO noted that the state water board circumvented the Legislature in the initial stages of developing CIWQS. Turned down for funding by the Legislature in the 2002-03 budget year, the state board went ahead with the project anyway, seeking funds from US EPA.[91] Funding was less then originally intended, however, and the independent review panel found that a major problem with the system was that it was not funded appropriately to handle all of the functions the boards sought from the system. The panel also noted that the governance of the program was bifurcated between the EPA and two divisions within the state water board, leading to little accountability or proper oversight.[92]

In a follow-up report released in May 2008, the same panel found that significant progress had been made in improving the system but that there were still problems regarding the accuracy of data, the ability of the system to produce useful reports and the use of the system by the public.[93] Faulty algorithms in the programming can create false violations, for example, and it is still difficult for the public to navigate the system and determine what kinds of water quality issues are relevant in their region. A report on enforcement actions produced by the state board in 2008 highlighted continuing problems with CIWQS: A chart depicting violations of stormwater permits showed five regions reporting more facilities with violations than the number of facilities inspected – an impossibility.

The noncompliance rate "for the stormwater program is likely misleading due to the quality of information in the CIWQS database," the report notes.[94]

Lack of Data

The water boards issue permits, set standards and adopt TMDLs every year that have serious consequences for both business and the environment, and water board officials acknowledge some of the those decisions are essentially made without sufficient information. Lack of monitoring data, the vastness of California's waters and a still-growing understanding of water science contribute to regulatory guesswork. The effect of regulation is often unknown.

"We base our decisions on such little data," Pamela Creeden, executive officer of the Central Valley Regional Water Control Board, acknowledged at a Commission advisory committee meeting.[95]

In Creeden's region, the controversial waiver for waste discharge requirements for irrigated agriculture adopted in 2006 notes that "although there is information that discharges of waste from irrigated lands have impaired waters of the state, information is not generally available concerning the specific locations of impairments, specific causes, specific types of waste, and specific management practices that could reduce impairments and improve and protect water quality."[96]

A joint effort by Cal/EPA and the state Resources Agency which sought to illuminate various environmental issues in California showed the difficulties facing the state. According to the 2004 "Environmental Protection Indicators for California" report, 80 percent of the state's shoreline, 72 percent of the bays, harbors and estuaries, and 75 percent of rivers, streams, lakes and reservoirs were unmonitored in 2002, making it impossible to determine whether those water bodies were safe for swimming.[97]

The lack of information is not altogether due to a simple lack of funding for more monitoring. It is also a failure by the state to better coordinate information. Numerous state and federal agencies – ranging from the United States Geological Survey to the state Department of Water Resources and Department of Fish and Game, as well as local monitoring groups – gather water data. But there has been a limited effort by the state to pull that data together to make it accessible to regulators, the public and others who would be interested.

This lack of coordination limits the state's ability to protect and improve water quality and determine what programs are working. For example, water monitoring done through billions of dollars doled out through voter-approved water bonds, such as Propositions 13, 40 and 50, have not been collected in a standardized format with the same type of quality assurance, leaving it difficult to compare monitoring and data.

The California Environmental Data Exchange Network (CEDEN) has been intended as a way to link various water databases together. According to the CEDEN Web site, "CEDEN is a growing statewide cooperative effort of various groups involved in the water and environmental resources of the state of California," and the purpose of the network is "to allow the exchange of water and environmental data between groups and to provide access to the public."[98]

CEDEN remains under development, however. The project was recently transferred from the Department of Water Resources to the state water board, with the state water board allocating $500,000 in fiscal year 2007-08 to the project.[99]

Lack of Science

Countless water users, environmentalists and water experts noted that the water boards do not engage in sufficient scientific research to support new regulation. In his testimony to the Commission, United States Navy Rear Admiral Len R. Hering, Sr. suggested the state's water boards lacked credibility because they did not have a rigorous science program.[100]

The water boards do conduct and fund a significant amount of scientific research. A survey compiled in 2008 by the state water board found 95 current research projects funded by the state and regional boards.[101] The boards also have a peer review program, requiring reviews of all science in regulatory programs, run in partnership with the University of California. And some regional boards contribute to independent science-based groups that conduct relevant research: The San Francisco Bay Regional Water Quality Control Board is a contributor to the San Francisco Estuary Institute, a nonprofit organization that conducts research and monitoring in the San Francisco Bay. Three regional boards in Southern California and the state board are partners in the Southern California Coastal Water Research Project, a joint powers agency that conducts research and monitoring along the Southern California coastline.

The problem, however, is that the state board has had no mechanism to keep track of board-funded research, centralize information gathered in that research and analyze the research to ensure it informs board programs across the state. The result is an inefficient use of scientific resources, as well as a public perception that the water boards are not using science in their decision-making.

The board created a new Office of Research, Planning and Performance in 2006, which is still in its development stage. The survey of ongoing research was a first effort by the state board to get a better understanding of scientific studies throughout the regions.

Compounding the boards' inability to coordinate research and better infuse it into decision-making is the increasingly complex problems the boards face. Even a robust scientific program would be challenged to find cost effective solutions to such difficult issues as non-point source pollution or watershed-wide issues. Presentations at a 2008 meeting of the American Association for the Advancement of Science concluded, for example, that pesticides that run off the land and mix in rivers and streams combine to produce a greater toxic effect on salmon than the pesticides would have individually.[102] How do the boards design regulation to respond to that information?

Two reports in the last three years – one commissioned by the state water board and another by the Ocean Science Trust – have sought ways to improve the use of science within water quality regulations in California, and each report has acknowledged the complexity of the subject matter the water boards are attempting to tackle. The report commissioned by the Ocean Science Trust listed these subjects as in need of more scientific inquiry:

- Total maximum daily loads and water quality objectives:
    - ✓ Better understanding of watershed functioning and pollutant origin and dynamics.
    - ✓ Developing scientifically based pollutant standards and water quality indicators.

  - ✓ Evaluating the effectiveness and cost-to-benefit ratio of TMDLs as a regulatory tool.

- Stormwater and non-point source impacts, origins and controls:
  - ✓ Understanding the origins, impacts, and the efficacy of management practices and measures related to stormwater, urban and agricultural nonpoint sources, and hydromodification.
- Emerging contaminants:
  - ✓ Understanding the sources and impacts of emerging contaminants.
  - ✓ Determining how best to control emerging and legacy pollutants.
- Climate change impacts on water quality:
  - ✓ Assessing the predicted water quality impacts of climate change using authoritative, non-politicized science.
  - ✓ Developing a strategic approach to predicted climate change impacts and their effects on the current regulatory framework.[103]

Water users complain that the boards too often implement regulations without a sound understanding of the science behind the problems or solutions.

"Stormwater science and technology lag behind regulatory implementation," Chris Crompton, manager of the Environmental Resources Section for Orange County Public Works Department, told the Commission.

Without adequate data and science, it is difficult for the water boards to determine the biggest threats to water quality and the best use of limited resources to address those threats.

Outdated Basin Plans Undermine Credibility

Throughout much of the state, basin plans – the key document outlining water quality standards for the region – are outdated. The chairman of the Central Valley Regional Board said the salinity standards in his region's basin plan have not been updated since the 1970s.[104] The executive officer of the Lahontan Regional Board said most sections of his region's basin plan are 14 years old.[105]

In addition to being outdated, there is evidence that aspects of the original basin plans were created in the 1970s without scientific study or even accurate data. "Many basin plan elements are found to lack a solid technical and scientific foundation," notes a review of the Los Angeles Regional Water Quality Control Board's basin plan conducted in 2003 by consultants hired by regulated entities.[106] A similar review of the Central Valley Regional Water Quality Control Board's basin plan noted that numerous water quality objectives placed into the basin plan were provided in a memo from the state board and were not based on local conditions.[107]

While basin plans are supposed to be updated every three years, regional boards have rarely had the resources to conduct a full review, complete with new scientific research.

Budget information provided by the state board shows that most regional boards have fewer than three staff members working on basin plan updates. Of 1,592.7 employees in the entire system in fiscal year 2007-08, just 41.2 – or 2.6 percent – were dedicated to basin planning.

"Currently, basin planning updates are being conducted as a routine, housekeeping type of function instead of a true analysis of current conditions," said Terese Ghio, past president of the Industrial Environmental Association and also a former member of the San Diego Regional Water Quality Control Board.[108]

The last major statewide basin plan update was in 1994. Many stakeholders note that the update occurred just as non-point source regulation began to truly be implemented, and current basin plans do not account for stormwater, despite its differences from a typical point discharge.

Numerous conflicts arise in each region due to this problem, leading to arguments over information and science before water users and

A Missed Opportunity

In 2002, Californians approved Proposition 50, a $3.44 billion general obligation bond designed to improve water quality in the state. In 2006, voters approved Proposition 84, a $5.388 billion general obligation bond designed to improve water quality, flood control and parks. Both propositions included extensive funding for integrated regional water management plans (IRWMP), which is intended to bring various groups together in a region to create a plan to improve water quality and supply. Funding goes both to the creation of the plans and to implement projects called for in the plans.

Proposition 50 earmarked $500 million for IRWMP, which has been spent. Proposition 84 earmarked $1 billion for IRWMP, most of which had not been spent when the Commission was conducting its study. IRWMP projects have been positive in many regions of the state, and regional water boards have participated in some of the projects.

However, at a time when virtually every regional board in the state is struggling to impose regulation based on badly out-of-date basin plans, the IRWMP funding appears to be a missed opportunity. Instead of creating new plans for each region, some of the funding could have gone to help regional boards work with stakeholders to revise and modernize basin plans. According to the propositions, however, the money is intended for local groups and local projects, not state government-sponsored functions.

While an up-to-date basin plan would not likely accomplish all of the things an IRWMP calls for – basin plans would be less likely to spell out how a region could increase water supply, for example – there is little question that one of the most important issues facing water quality in the state is outdated basin plans. An effort to redo basin plans can bring stakeholders together to help plot out the state's water future – the same goal that IRWMP has – without creating an entirely new bureaucracy.

The state could have used some of the $1.5 billion in bond money approved during the last four years for water planning to update basin plans.

other constituencies even begin to debate appropriate policy. Regulated entities contend that most water quality standards and beneficial uses were developed prior to stormwater regulations, and because stormwater is significantly different than point source discharges, basin plans should be updated to include standards specific to non-point sources.

State and regional board officials acknowledge this problem.

"The Basin Plans, originally written in the 1970s and periodically updated, currently do not fully reflect the Water Board's fast-growing body of knowledge and evolving regulatory approaches to regional and statewide concerns such as stormwater, non-point sources (e.g. irrigated agriculture), and biological integrity," reads the state water board's current strategic plan.[109]

The plan calls for all basin plans to be updated, but not until 2015.

A major obstacle in updating basin plans is money. The water boards do not generate any fees that could be applied to basin planning, so it is one of the few programs funded solely through the General Fund. This is, in part, why major updating efforts have not occurred.

Appeals Process Flawed

Appeals were cited by State Water Resources Control Board chairwoman Tam Doduc as a key piece of the state board's authority to direct regional board activities. Any aggrieved person can appeal a regional board decision – such as a permit, or enforcement action – to the state board, which then has the power to overturn the regional board or send the issue back to the regional board with direction on changes that should be made.

The Commission found, however, that many stakeholders do not have confidence in the appeals process.

Regional board decisions rarely are overturned by the board. According to information provided to the Commission, the state board received 231 appeals of regional board actions between July 1, 2001, and June 30, 2008. The board upheld regional board actions on 193 of those appeals, modified regional board actions on 33 appeals, and is still making a determination on 5 appeals. The board reversed 14 percent of the regional board actions that were appealed to it in this seven-year period.[110]

In addition, the process of reviewing potential appeals appears troubling. As described by Gary Wolff, vice chairman of the State Water Resources Control Board, the state board's executive director and chief counsel vet appeals and then make a recommendation to the board members as to whether that appeal should be heard by the board or not. It is up to board members to seek out staff to have a broader discussion on the potential appeal, and if board members do not respond, the executive director issues a letter to the petitioner with a decision as to whether the appeal will go forward. Wolff acknowledged that in recent years, most of the decisions to consider appeals are based on whether a legal violation has occurred – not whether an action contradicts state policy or could clear up a controversial issue.

Of particular concern is the inadequate explanation given to would-be petitioners. For example, Laurel Firestone, an attorney representing the Visalia-based Community Water Center, told the Commission that she received a one-page letter informing her that the state board would not review a petition she filed concerning the Central Valley Regional Water Quality Control Board's 2007 waiver for waste discharge requirements for dairies. The waiver was a controversial issue, marking one of the first efforts to regulate dairies in the country. Firestone said she received no further explanation from the board as to why her petition was denied. It was only at the Commission's hearing that she learned that there was a five-page explanation, a public document, on why the board denied the petition, but it was written by the board's chief counsel.

Two environmental groups, including the one represented by Firestone, since have gone to court to block the waiver, arguing it does not go far enough in regulating dairies.

"It is pretty common to have an appeal dismissed without explanation," noted Linda Sheehan, executive director of the California Coastkeeper Alliance, at the Commission's April 2008 hearing.

While chairwoman Doduc touted the appeals process as a key check on regional board behavior, she acknowledged one flaw.

"The petition process is a reactive process," she noted. "I think the state water board does need to be more proactive in terms of reaching out to regional boards, the various stakeholders and identifying emerging issues and getting ahead of the curve."

The problem, however, is that because the state board handles appeals, it is not allowed to comment or intervene on an action taken by a regional board that could be appealed to the state board. The state's Administrative Procedure Act prohibits anyone who might have a role in an appellate process from expressing an opinion on a proceeding if an appeal is possible.[111] Thus, the board's role as judge prevents it from taking a proactive role in some regional board activities.

"Most 'coordination' (between the state and regional boards) is reactive and happens at the end of processes when something goes wrong and there are appeals or lawsuits," Chris Crompton, manager of environmental resources for Orange County, told the Commission in written testimony. "This 'back-end coordination' is inefficient and hence costly, and has real environmental impacts from delayed decisions/actions."[112]

Outdated Rules Limit Critical Communications

Another factor that undermines stakeholder confidence in the system is the boards' strict prohibition against ex parte communications. Both state and regional board members are subject to Chapter 4.5 of the state Administrative Procedure Act, which prohibits communication between board members and anyone subject to an adjudicative proceeding, such as the issuance of a discharge permit, enforcement action or water rights permit.[113]

Some water users and others involved in the process complain that ex parte rules limit regulated entities' ability to discuss important and complex issues with board members. Instead, local governments, businesses and other stakeholders are often limited to just a few minutes of testimony before the board during a formal hearing, despite the profound fiscal impact board decisions can have on these regulated entities.

Carole Besswick, chairwoman of the Santa Ana Regional Water Quality Control Board and a former member of the South Coast Air Quality Management District, told the Commission that one of the biggest differences between the water boards and air district boards was that air board members had much more freedom to talk to the people they regulated. As an air regulator, Beswick noted she frequently interacted with those she regulated, which helped her better understand the issues she and stakeholders faced.[114]

Others also have complained about the water boards' ex parte rules, even other state agencies. In a 2000 letter to the state water board, the state Department of Water Resources complained that the water boards' "strict reading of the ex parte communication rules is not in the public interest, because it reduces the ability of the public and parties to seek assistance from the board and staff on complicated water rights issues and to work toward resolving problems."[115]

Ex parte rules are different at other state boards and commissions. The Integrated Waste Management Board was created in 1989 and the law enacting the board included what is referred to as a "sunshine" rule. Section 40412 of the Public Resources Code allows for communication between board members and regulated entities as long the board member fully discloses the communication at a public meeting.[116] Other boards, such as the California Public Utilities Commission and the state Air Resources Board, have similar provisions. The "sunshine" rule allows regulators to interact with stakeholders so that they can become better informed, but at the same time ensures that all such communications are known to everyone interested in the proceeding.

"As for the fairness of the process, the regulated community is frustrated by the fact that members of the SWCRB and the nine RWQCBs say they are unapproachable under state law," complained Mick Pattinson, president and CEO of Barratt American Homes, a Southern California homebuilder. "While it is perfectly acceptable and appropriate to speak with elected city, state and federal officials, it is unfathomable that the same rights do not apply to unelected board members."[117]

10 Percent Rule Limits Appointees

Governors have long struggled to find interested, qualified people to serve on regional water boards. With nine positions on each board, and because the positions are virtually voluntary, with only a $100 per diem paid per meeting, appointments are a continuing problem.

As the Commission conducted its study, five of the nine regional boards each had three vacancies, leaving a third of these board spots unfilled. Some boards have gone with as few as five members for months at a time. This can lead to difficulties in achieving the quorum necessary for a board to take action, slowing down decision-making and impacting the environment and businesses waiting for permits or other actions.

Part of the difficulty in finding appointees stems from the so-called 10 Percent Rule, which is embedded in both federal and state law. The Clean Water Act prohibits anyone from serving on a board that issues permits if they have earned "a significant portion of his income directly or indirectly from permit holders or applicants for a permit."[118] Similar language was adopted into state statute. The EPA later interpreted significant to mean 10 percent or more of income.

The 10 Percent Rule goes beyond typical conflict-of-interest rules, which forbid people from participating in decisions that could affect their income, by prohibiting someone from even serving on a water board if they have a conflict. The rule has dramatically narrowed the pool of potential water board candidates who were interested or qualified to serve.

For example, Sari Sommerstram, a watershed consultant with a Ph.D. in resource planning and conservation, was appointed to serve on the North Coast Water Quality Control Board by Governor Arnold Schwarzenegger. Despite her background in water, she was not allowed to continue on the board due to the 10 Percent Rule. Her husband raised trees which were sold to timber companies for use in reforestation, and because those same companies were regulated by the water board, she had to leave the board soon after she joined it.[119]

Additionally, while each regional board has a slot for a county supervisor, it is virtually impossible to find a supervisor who qualifies for a board position because counties are subject to regulation under stormwater permits and because in most medium- and large-sized California counties, supervisors are full-time county employees.

For a governor, identifying 81 people interested in serving on a regional board who do not have a 10 Percent Rule conflict is a daunting task.

There is widespread consensus among stakeholders and others in California that the 10 Percent Rule should be changed. In her testimony to the Commission, however, Alexis Strauss of US EPA noted that it was extremely difficult to change US EPA regulations. Others noted that because California is one of only a few states with part-time political appointees making permit decisions – Colorado and Virginia are two other states with state water boards – there is little interest in Washington, D.C., to enact regulatory reform.

An Increasingly Complex Job

As water quality regulations evolve to handle increasingly complicated pollution programs, some suggest a part-time board has a more difficult time making appropriate decisions.

State Water Resources Control Board member Art Baggett told the Commission that many routine permits have grown from 10 to 12 pages when he joined the board in 1999 to more than 100 pages today, in part because the state has stepped up enforcement of permits and dischargers are now more concerned about every detail.[120] Permits can take up a significant amount of board time at monthly meetings. Due to permits' increased complexity, many stakeholders suggest that regional board members simply rubber stamp staff suggestions because they do not have the knowledge base to question the details.

A former board member told the Commission that the boards can be overwhelmed by volumes of paperwork that are difficult to understand without a background in water science.

Terese Ghio, who served on the San Diego Regional Water Quality Control Board, told the Commission that many regional board members were simply unqualified to render decisions on technical and science-based regulations. Ghio noted she had a background in wastewater treatment and was able to question staff on permit technical issues, but many other board members are not.

Even with technical expertise, Ghio noted the difficulty of the job. "In some cases, it was thousands of pages given to us one week before the meeting," she said.

As the complexity of permits and other regulations grows, it is unclear whether regional boards can act as a check on staff, or other stakeholders, to ensure they are making the right decision for the environment and the economy.

U.S. Navy's Stormwater Permit Illustrates Difficulties

The United States Navy receives an industrial stormwater permit from the San Diego Regional Water Quality Control Board for operations on three Naval bases along ports in the San Diego region. The 2002 permit has created conflict between the board and the Navy, and the Commission heard public testimony from the Navy and received written testimony from the executive officer of the San Diego board regarding the conflict. The Commission is not taking a side in this dispute, rather, the Commission points to the issues surrounding the Navy's stormwater permit as illustrative of several systemic problems: The boards are attempting to regulate non-point source pollution with standards that were developed before non-point source pollution was regulated, leading to a credibility problem among stakeholders who argue non-point standards should be different; the boards do not have the resources to conduct appropriate research to justify regulations or find cost-effective solutions to easing pollution problems; the boards are not as collaborative with stakeholders as they could be, which results in disputes that hinder progress toward protecting water quality; and, the relationship between the state and regional boards is unclear.

The Navy makes several contentions regarding their 2002 permit and the toxicity standard required in the permit:

- The standard is nearly impossible to meet without building a $300-million water treatment facility.
- The board is using a standard created in the 1974 Water Quality Control Policy for the Enclosed Bays and Estuaries of California, which states that it is not intended for land runoff.
- Based on letters between the Navy and the state water board, the state board and the regional board have differing interpretations of the 1974 Water Quality Control Policy for the Enclosed Bays and Estuaries of California which would lead to differing regulations, but the regional board has ignored the state board's opinion and the state board has done nothing to direct the regional board on the issue.
- A study conducted by the Navy shows that even when Navy stormwater is higher than the toxicity standard, the receiving water – the water to which the stormwater flows – still is not toxic. Thus, the Navy argues that the standard is stricter than necessary to protect San Diego Bay.
- The Navy study was completed in 2006 and offered two alternatives for the board to use when measuring toxicity, yet the board for two years did not responded to those suggestions. "We believe the board did not consider the study because it does not have the technical expertise to review it,'' Rear Admiral Len R. Hering Sr. said in his testimony to the Commission.

The board argues that the permit and its use of the toxicity standard are valid. It contends that:

- The board's basin plan states that "all waters shall be maintained free from toxic substances in concentrations that are toxic to or produce detrimental physiological responses in human, plant, animal, or aquatic life…" and that the board is properly interpreting that broad standard and standards within the Water Quality Control Policy for the Enclosed Bays and Estuaries of California, which actually calls for the eventual phasing out of all discharges into the state's bays.
- The Water Quality Control Policy for the Enclosed Bays and Estuaries of California sets the toxicity standard the Navy is required to abide by for all "industrial process waters," which the board interprets as the Navy's stormwater. The state board's interpretation that "industrial process waters" does not refer to stormwater could be considered by the state board if the Navy appealed its permit to the state board, which it has not done.
- The board allowed the Navy four years from the date of the 2002 permit to begin complying with the toxicity standard.
- There are Best Management Practices, such as detention basins, filtration and wetlands, that the Navy could create to meet the standard that would be cheaper than a treatment facility, but the board is prohibited by state law from dictating to the Navy or other regulated entities how they comply with their permits.
- The Navy's argument that the board should measure pollution in the receiving water, instead of measuring the Navy's stormwater, is simply a way for the Navy to make no improvements to its stormwater discharge, and all dischargers should be measuring and improving their discharge.
- The Navy was allowed to present the findings from its study to the board in a 2006 public hearing, and the board may use some of the information from the study in the re-issuance of the permit, which is scheduled for 2009.

As the Commission was finalizing this study, the San Diego board was preparing a draft of a proposed new stormwater permit for the Navy that was scheduled to be adopted in early 2009.

State Has Difficulty Addressing Modern Water Problems

As focus in water quality regulation has shifted from point source pollution controls to non-point source pollution, the water boards have found it increasingly difficult to address and reduce water pollution. Many non-point source pollution problems require solutions outside of the water boards' typical regulatory programs, and more interaction with other state and local regulatory agencies.

Consider: Studies suggest that some mercury contamination in water along the California coastline is caused by coal-burning power plants in China.[121] Other water pollution problems stem from sources closer to home, but are still difficult for water boards to address. Studies conducted by the Southern California Coastal Water Research Project have found that local air pollution contributes to water pollution. One study showed that 50 to 100 percent of trace metals in stormwater runoff were deposited from the air.[122] Pollution from both vehicles and stationary sources, such as power plants, ends up in the water.

"The old models that EPA has put forward to deal with stormwater as if it were just a subset of wastewater are not models that carry us forward," Alexis Strauss, director of the Water Division for EPA's Region 9, told the Commission.

The water boards need help from other regulatory agencies, particularly the state air resources board and other air districts. In an attempt to begin addressing aerial deposition, the state Air Resources Board and the state Water Resources Control Board met in a joint public session in February 2006. The boards heard presentations on the impacts of airborne metals and mercury

How Proposition 218 Affects Stormwater

Approved by voters in 1996, Proposition 218 requires local governments to obtain the approval of two-thirds of voters, or a majority of property owners, to raise certain fees or taxes. The proposition excluded sewer, water or trash collection, however, allowing cities and counties to raise fees on utilities based on the vote of elected officials.

Efforts to consider stormwater services as a utility exempted from Proposition 218 were challenged, and in 2002, an appellate court decision in Howard Jarvis Taxpayers Association v. City of Salinas found that charges imposed by the city to pay for stormwater management were not utility fees and therefore were not exempt from Proposition 218 requirements.

Because of this, many local government officials complain that they are unable to pay for stormwater management services in the same way they pay for wastewater treatment, despite facing the same kind of regulation as wastewater treatment. Stormwater funds must come from the general funds of each municipality and compete with other services, such as police and fire protection. One regional water board official noted that wastewater treatment operations in his region had an overall budget of about five times that of stormwater agencies.

Efforts to amend Proposition 218 have been made in the Legislature but have been unsuccessful. SCA 12, by state Sen. Tom Torlakson, D-Antioch, in 2007 would have exempted new or increased stormwater and urban runoff management fees from Proposition 218's requirements, but it did not make it through the legislative process.

Sources: Legislative Analyst's Office. December 1996. "Understanding Proposition 218." Senate Local Government Committee. June 27, 2007. Tom Mumley, Assistant Executive Officer. July 31, 2008. Personal communication with Commission. Bill Analysis, SCA 12 by state Sen. Tom Torlakson, D-Antioch.

in water and pledged to work together to continue investigating the issue. But no formal relationship has been created.

One avenue receiving attention as a way to better address non-point source pollution is through a broader focus on watershed health. The idea is to seek creative and collaborative ways to reduce water pollution when typical regulatory practices are not working. Several efforts involving the water boards have been made to increase the focus on watershed-wide planning and projects.

The state board launched a Watershed Management Initiative in 1995, which required each regional board to develop management strategies for each of its watersheds and funded positions at each regional board to work on watershed issues. Today, each regional board continues to employ a full-time or part-time person who works on watershed issues, mainly as a liaison between the boards and local watershed coalitions. In addition, efforts by CalFed – the joint state-federal agency overseeing the Bay Delta – and a watershed council created by Cal/EPA and the state Resources Agency have sought to encourage watershed-level management and planning in recent years. The state Department of Conservation, which is within the Resources Agency, is currently using money from Proposition 50 and other state funds to continue work on adopting a statewide watershed program that would help develop local watershed management plans and projects.[123]

Despite these efforts, the state is still struggling with implementing true watershed management. The watershed council created by the state has disbanded, and many facets of its strategic plan, such as getting all state agencies to agree on a common set of watershed boundaries or coordinating regulatory programs at the watershed level, have not occurred. An interagency task force of deputy directors that met for an 18-month period in 2005 and 2006 has disbanded. Interest among state leaders in the topic has waxed and waned.

The EPA and San Francisco Bay Regional Water Quality Board attempted to create a watershed permit that would regulate all entities, including non-point sources, discharging into one watershed, for example. The effort was abandoned, however, because the regulators and stakeholders could not come up with solutions to fairly regulate very different sources all in one permit.

The state has promoted the idea of watershed planning as a way to improve water quality and water supply, by distributing money through bonds in the past several years for local planning efforts.

About $640 million was proposed in Proposition 50 for Integrated Regional Water Management Planning (IRWMP) projects, for example, and another $1 billion is earmarked in Proposition 84 for similar projects.

Participation in the IRWMP process by regional boards has been mixed, however. Some boards, such as the Santa Ana Regional Water Quality Control Board and the North Coast Regional Water Quality Control Board, have been active participants. Others have not.

Strengthening Ties, Solving Problems

In a February 7, 1969, letter to the chairman of the State Water Resources Control Board, Assemblyman Carley V. Porter lamented that the state's preeminent water quality law was 20 years old. "... we are indeed in different times and facing different situations than existed in 1949," Porter wrote. The letter urged a comprehensive review of the 1949 Dickey Act, and led to a major overhaul that became known as the Porter-Cologne Act that passed later that year.[124]

Four decades after the creation of Porter-Cologne, a similar letter could be written about it: We are in different times and face different situations than the Porter-Cologne framers imagined in 1969.

Through its study process, the Commission found two inseparable issues. First, water quality problems in the state, and efforts to address them, are becoming increasingly complicated. This was underscored by a report released in October 2008 by the National Research Council that essentially declared two decades of national stormwater regulatory policy a failure.[125] Second, as it grapples with these complex water quality problems, California acts through a decentralized governance structure that lacks accountability and transparency, and is unable to match resources to priorities. As a consequence, many in the water community – from environmental groups to regulated entities – have lost confidence in the system.

The two issues combined lead the Commission to conclude that major reform is needed. A 40-year-old regulatory structure is simply not equipped to handle current problems.

A new, ideal system should include the following characteristics:

- ***A unified state agency.*** Completely distinct regional boards may have been appropriate in past decades, but current common problems – urban stormwater, for example, or impairments in different water bodies caused by the same contaminants or sources – call for a more centralized regulatory approach with a common vision and common processes. A unified state agency can better identify key problems in the state and align resources to address those problems. Efficiencies gained by a stronger bond between the state and regions will get to clean water outcomes faster and cheaper.

- ***Local input.*** A need for local input on water quality objectives remains, however, as water bodies are unique, with unique problems and solutions. Water quality objectives should continue to be set at the regional level, with vigorous debate and discussion among local stakeholders.
- ***A focus on accountability and outcomes.*** The public, and policy-makers, have a right to clearer information from the boards as to the state of the state's waters, and to which regulatory programs are effective – and which are not. Additionally, the boards must expand their scope beyond ensuring that dischargers are abiding by their permits toward this fundamental question: Are our programs protecting and improving water quality?
- ***Integrated science, accessible data.*** As water pollution problems increase in complexity, California needs to integrate more scientific analysis into board programs. The state board needs scientific advisors to help guide and coordinate research and use that research in regulation. In addition, the boards' dearth of water quality data must be rectified, and it can be: Numerous federal, state and local agencies, as well as other groups, already are collecting information. It is time for the state to make a serious effort to collect that information into an integrated system to allow the boards and others to use it to improve outcomes.

This system – one unified agency, with local input, an emphasis on accountability and outcomes and better use of science and data – will allow the boards and their communities to communicate better with stakeholders, and to better address problems. This should launch collaborative efforts in each region to focus on the most important tasks: updating basin plans, using science and economic analysis to drive decision-making, assessing program effectiveness and, when warranted, making swift changes.

Above all, California's water boards must set priorities. A mission to protect all waters everywhere to the same level – as stated in Porter-Cologne – simply is not possible, given the resources of the state, local governments and others. Water bodies must be prioritized, and so too must solutions. Economic analysis is needed to determine where the state can get the most clean up or pollution prevention for each dollar spent. Collaboration centered around watersheds is needed to spark innovative solutions to water quality problems that are caused by and affect entire ecosystems.

Some water board officials noted they thought of themselves as water cops. This is an apt description – the boards' job is to police and protect the waters. But just as modern policing has evolved to include the concept of community policing – with police working within neighborhoods to help prevent crime – so to must the water boards work in a collaborative way with water users and others who benefit from clean water to find solutions to water quality programs. Non-regulatory approaches could be appropriate answers in some watersheds.

The key to board effectiveness in the future is up-to-date basin plans, built on current science and an understanding of non-point source pollution. Basin plans were created more than 30 years ago. Many water quality standards have not been updated since, and may not have been based on sound science or monitoring data when they were created. This creates a fundamental lack of credibility in the boards' decision-making. The state, with stakeholder support, must launch an effort to ensure these foundational regulatory documents reflect the current status of water use and needs, as well as water protection priorities.

The water boards have made recent efforts to improve. New offices designed to improve information management, strategic planning and public participation are positive steps, and the boards should be commended for recognizing weaknesses and seeking ways to address those issues. The Commission met countless board members and staff who were working diligently to better programs and board performance. But the state water board's boldest proposal, the 2008 Water Quality Improvement Initiative, only recommend changes within the current structural framework. The Commission believes a more profound change is required, one that will involve thoughtful and committed leadership and engagement by the governor and Legislature.

Change will be difficult. The Commission found that while virtually all stakeholders had a laundry list of complaints regarding the water boards, most did not endorse a major structural overhaul. Many water users and others in the water arena preferred processes and actions taken by specific regional boards that benefited them. The Commission's goal is different: Its recommendations seek to drive change that will protect and enhance water quality through a process that is more fair, transparent and effective.

The Commission recommends reconstituting the state board as a nine-member board, with five of the board members serving solely on the state board and four members serving both on the state board and as a full-time chairperson of a regional board. The regional chairpersons would rotate on and off the state board, and serve staggered, two-year terms. All regional board chairpersons would be full-time, and appointed by the governor. A state board that includes a mix of state and regional perspectives should produce a more unified agency and allow the state board a better understanding of regional issues and vice versa. Regional board buy-in to state board policies and priorities would be increased, while the state board would continue to have a majority of voting members considering issues from a statewide vantage point. Statewide priorities and policies would be more likely to be implemented under this structure.

Other States' Governance Structures

During its study, the Commission examined the governance structures surrounding water quality regulation in other states to determine if there was a better model than the structure in California. California is unique: No other state governs water quality with a gubernatorally-appointed state board and gubernatorally-appointed regional boards.

Some states – including Virginia and Colorado – have appointees administering water quality, but both of those states have one board overseeing the entire state. Most states have a bureaucracy that sets water quality standards, although some have a decentralized system, in which regional offices set standards and administer other programs, and many have a stakeholder board involved in some aspects of decision-making.

The Commission could find no evidence that one governance style or another led to cleaner water. Nonetheless, there may be lessons California can learn from other states' systems. California may learn from the following states that are comparable in terms of size and geography:

- ***New York.*** The Division of Water within the New York State Department of Environmental Conservation handles National Pollutant Discharge Elimination System (NPDES) program activities, water quality monitoring, standards, total maximum daily loads (TMDLs), non-point source programs, water resource permitting, permitting for discharges to ground water and dam safety. The Department of Environmental Conservation has a central office in Albany and nine regional offices throughout the state. The department maintains a Water Management Advisory Committee, which began in 1979 and is made up of environmental, business, municipal, academic and citizen representatives. The committee allows water policies and issues to be vetted and informed by stakeholders.
- ***Oregon.*** The Oregon Department of Environmental Quality administers the NPDES program. There is a central office in Portland and three regional offices. The regional offices issue permits, handle compliance issues and take informal enforcement actions or refer potential enforcement issues to the central office. The central office issues general permits, develops state regulations and policies and oversees regional offices. While the department sets water quality standards, a gubernatorally-appointed Environmental Quality Commission approves those standards and hears appeals regarding penalties assessed by the department and other issues.
- ***Florida.*** The Florida Department of Environmental Protection administers the NPDES program. Six regional offices issue most point source permits and ensure compliance with those permits, while the main headquarters issues all stormwater permits for the state. Florida also has five water management districts, which administer flood management programs and control water rights and flow issues. Each district is run by nine gubernatorial appointees, and each district has taxing authority to raise money to improve water quality and supply.

United States Environmental Protection Agency. September 27, 2005. "Permitting for Environmental Results: NPDES Profile: Oregon and Indian Country." Washington D.C. United States Environmental Protection Agency. March 10, 2005. "Permitting for Environmental Results: NPDES Profile: Florida and Indian Country." Washington D.C. Robert Moresi, senior hydrogeologist, Black and Veatch, Tampa, FL. September 19, 2008. Personal communication with Commission.

This new structure will eliminate barriers between the boards and improve communication and collaboration among regions. It is the surest way to provide both a unified state agency while maintaining regional input through a regional board. While the regional board chairpersons will become full-time positions, the other members of the regional board will remain part-time volunteers paid a per diem. The regional board chairpersons will represent the state board in their districts and be point persons for monitoring implementation of state policy at the regional level.

Other structural changes are needed. To improve confidence in the system and ensure accountability, the appeals process must be stripped from the state board and handled by a separate appeals board. This will ensure appropriate oversight of board activities, restore confidence in the appeals process and, in addition, allow the state board more leeway to interact with regional boards before they make key decisions.

To increase emphasis on science, the state should create a science advisory board to help the state and regional boards coordinate research and ensure that research is properly integrated into regulation. Regional boards also should be encouraged to become involved in an independent, collaborative scientific institute such as the Southern California Coastal Water Research Project, which brings regulators and the regulated together to jointly sponsor scientific research.

The state also must create an independent data institute to help gather, coordinate and present water data. Acting as a water data library, the institute would allow the boards and others to tap into the vast amount of water quality information that is gathered, but currently not synthesized.

The Commission realizes these are ambitious proposals, particularly in a period where both the state and local governments face daunting fiscal crises. But there are savings to be had through these strategies, which can create government efficiency, leverage resources of multiple agencies and stakeholders, and reduce the conflict that can consume both public and private resources without producing better outcomes.

Protecting and improving water quality is a challenging task, but one essential to the state's vitality and growth.

Strengthening Ties, Redefining Roles

The Commission considered abolishing the regional boards in favor of a bureaucracy controlled in Sacramento. This idea was proposed in Governor Schwarzenegger's California Performance Review and holds some appeal: One department could improve efficiencies and consistency.

But many board officials and other stakeholders made a compelling case for the concept of regional decision-making for water quality regulation.

"The water quality problems of the rainy North Coast are just fundamentally different than the water quality problems of the Central Valley or the Colorado River desert," Craig Wilson, an attorney for the dairy industry and former chief counsel of the state board, told the Commission. "I think having an agency that responds to those differences is important."[126]

Santa Ana Regional Water Quality Control Board chairwoman Carole Beswick was persuasive in her argument for a regional board approach, noting that an appointed board can work with businesses and other stakeholders in a way that a civil servant would likely not.[127]

The Commission concludes that regional decision-making remains a sound approach.

Yet the Commission encountered numerous problems with the current regional board structure. Boards appear to have dramatically different approaches on some important policy issues and processes. Despite Porter-Cologne's framework giving the state board oversight authority of regional boards, the state board does not routinely exercise that authority and there is little accountability in the system to ensure that regional boards are achieving desired results or following state policies.

"The state board is extremely reluctant to get involved in decisions made at the local level," US Navy Rear Admiral Len Hering, Sr. told the Commission.[128]

In addition, governors of both parties have struggled to find 81 appointees at any given time who are qualified and interested in serving on regional boards, and as the complexity of water quality regulation has increased, it is questionable whether voluntary boards are capable of awarding proper permits, making other technically difficult decisions, and acting as a check on staff as they were intended to be.

The Schwarzenegger administration sought to address some of these issues through its proposed Water Quality Improvement Initiative. To address inconsistency problems, the initiative proposed the Water Quality Council, which would consist of the chairpersons of the nine regional boards and the chair of the state board. The council would hold public hearings and address issues of inconsistency by making suggestions to the state board. The council also would help the state board set statewide priorities.

The initiative also called for the reduction in size of regional boards from nine to seven members, and, in recognition of the regional boards' struggles to handle complex issues, proposed allowing executive officers to issue federal NPDES permits. Changes to the 10 Percent Rule that would only prohibit someone from serving on a regional board if they earned income from an entity permitted by that board – not all boards – would widen the pool of potential regional board appointees.

The initiative is a good start, but does not go far enough.

Instead of creating a new council, the state board should be reformed to include some regional board representation. Five members of the state board would be appointed by the governor to represent statewide interests, and have backgrounds similar to the current requirements, with one exception: instead of two spots for engineers, there should be one engineer position and another position for a scientist or resources economist with experience in water-related areas. Four other members of the state board would be serving simultaneously as the chairperson of a regional board. All of the members would be appointed by the governor, with the governor selecting the four regional board chairpersons to serve on the state board for two-year terms.

All nine regional board chairpersons should work full-time, allowing them to better coordinate and implement statewide policies, while also allowing them more time to work with executive officers and staff members in each region and to serve as a check on staff. All regional board chairpersons should have a background in water quality issues.

The Commission supports the administration's proposal to shrink regional boards to seven members. The boards should continue to be stakeholder boards, with the part-time members earning a per diem, which should be raised to $500 per meeting, as the administration proposed, and allowed to grow with inflation. Raising the per diem would help make these positions more attractive to a wider group of people, not just those who can afford such a time-consuming, semi-volunteer position.

The state board would continue to set statewide policies and priorities. In addition, the state board would be more capable of working with regional boards in advance of controversial decisions made at the regional level.

The six part-time regional board members should represent the following backgrounds: experience in water supply, conservation or production, experience in irrigated agriculture, experience in industrial water use, experience in local government, experience as a water-related scientist or engineer, and experience with a nongovernmental organization associated with recreation, fish, wildlife or the environment.

In addition, executive officers at each regional board would be allowed to conduct most permitting activity. Permits would still be issued through a public hearing process with executive officers conducting hearings that allowed water users as well as the public to comment on permits. Executive officers would become career executive assignment positions reporting to the executive director of the state board. At the state level, the executive director would issue state permits through a similar public process.

Regional boards would be required to conduct an annual review of the executive officer's performance, which would be taken under advisement by the executive director. This would further strengthen the relationship between the state and regions.

This new structure has the following advantages:

- ***Stronger tie between the state and regions.*** Overlapping regional and state board membership allows for a clearer structural relationship between the state board and regional boards. The frequent interaction between some regional board chairpersons, as they met as the state board, and the state board members would allow regions to share more information, to better set and implement similar priorities and to strengthen the concept of the boards as one state agency. In addition, changing the executive officer position from a regional board employee to a career executive assistant hired by the executive director of the state board would further improve the relationship between the regional boards and the state board.

- ***Strong chair bolsters leadership, clarifies state priorities.*** Implementing a "strong chair" system, in which the chairperson of the regional boards is full-time and the other members are not, allows the chairperson to develop more expertise in pertinent issues and become the true leader in the region on water quality. This concept is based on the successful model used by the state Air Resources Board.
- ***Retains regional decision-making.*** While the overlap between the boards would improve consistency and efficiency, regional boards would still adopt basin plans, adopt TMDLs and otherwise control water quality policy in their region.
- ***Focuses state and regional boards on planning and policy.*** By delegating permitting authority to regional executive officers and the executive director of the state board, state and regional boards would have more time to discuss and consider broader policies and update basin plans. This is the appropriate responsibility of the boards.
- ***Improves governor's ability to fill appointments.*** This proposal would reduce the number of state and regional water board appointees from an unworkable 86 to a more feasible 68. Governors should have an easier time finding 54 part-time regional board appointees, compared to the current 81.

Increasing Transparency and Accountability

Several aspects of the water boards' governance structure that hinder transparency and accountability require change.

Communication should be improved. Strict ex parte rules limit the ability to discuss issues with the regulated community. This leaves discussion to public hearings, in which speakers are often limited to a few minutes of testimony. These limits prevent communication between regulators and the regulated that could help boards better solve problems. The result is a lack of trust among stakeholders of the boards, and a lack of understanding as to why boards take the actions they do.

The Commission believes the water boards should adopt ex parte rules used by other boards, such as the Integrated Waste Management Board, that allow for communication between regulators and the regulated as long as they are disclosed in a public meeting.

If executive officers and the executive director are allowed to issue permits, they too should be allowed to communicate with all stakeholders as long as it is disclosed.

For greater understanding and better outcomes, communication should be encouraged.

Appeals process should be reformed. Many water users and others in the water community complained about the appeals process, arguing the state board rarely heard appeals and rarely was willing to overturn regional board decisions. The state board process of determining which appeals to consider is too staff-driven and often it is unclear to stakeholders why the board has not taken up an appeal. This adds to the mistrust stakeholders have for the boards.

Additionally, the state board's appellate role prohibits it from interacting with regional boards before they issue a controversial permit or make another decision that could be subject to appeal. The Administrative Procedure Act, which governs much of the boards' processes, require an absence of bias, prejudice or interest in a proceeding by a body that could hear the issue on appeal. Thus, the system is set up to create distance between the state and regional boards on decision-making, contributing to inconsistency and lack of communication and interaction between the state and regional boards.

Change is needed to restore confidence in the appeals process.

In an effort to improve the water boards' appeals process, the Commission examined how other state and federal environmental agencies that make quasi-judicial decisions, such as issuing permits, handle appeals.

Large local air quality management districts, such as the South Coast Air Quality Management District and the Bay Area Air Quality Management District, have hearing boards that handle appeals of district board decisions. The boards are appointed by the district board members and are paid a per diem for each meeting. The hearing board for the Bay Area Air Quality Management District, a five-member board consisting of an attorney, an engineer, a member of the medical profession and two members of the public, meet between three to five times each quarter to hear requests for a variance from district rules and appeals of abatement orders and permits.

US EPA also has an appeals board, which hears appeals of regulatory actions taken by US EPA under the Clean Water Act, the Clean Air Act, the Safe Drinking Water Act and five other environmental laws. US EPA's Environmental Appeals Board consists of four administrative law judges, who are appointed by the administrator of US EPA, who in turn is appointed by the President. A panel of three of the four board members hears each case. The board typically hears appeals based on the terms of federal permits or fines assessed by US EPA.

The Commission believes the water board appeals process should be separated from the board, to improve trust in the process and to give the state board room to become more involved in regional board issues before they get to the appeals stage.

A hearing board model is the best fit for the water boards. A board comprised of three administrative law judges, with backgrounds in water-related issues and appointed by the governor, should be created to hear appeals.

Anyone, whether regulated entities or members of the public, would be allowed to appeal a regional or state board decision to the appeals board, which would be required to review petitions for appeal and make decisions based on whether the action under the appeal was legally appropriate and consistent with state or regional policy. The board should follow guidelines set out in the state's Administrative Procedure Act for appeals processes, and should be required to issue a ruling on an appeal within 90 days of hearing. Petitioners who were unsatisfied with the results of an appeal could then go to court, as they do now.

Report cards would provide easy-to-understand information and add accountability. One of the most valuable and easily accessible reports published on water quality in the state is the Beach Report Card created by the environmental group Heal the Bay. Now in its 18th year, the report card gives a letter grade to more than 375 locations year-round, and has become so well respected that its grades have been used to obtain funding for water quality projects and cited during the water boards' process of listing impaired water bodies.

The grading process has gone through several iterations during the report cards' history, and the current formula requires weekly testing at each site for three indicator bacteria. The grading formula – a key to the credibility of the report cards – has been validated by the California Beach Water Quality Workgroup, an ad hoc committee that includes regulators, regulated entities, local governments and environmental groups, and is geared toward whether a beach is safe for swimming.

These report cards are important in two ways: They provide easily understandable information to the public, and they hold water quality regulators and dischargers accountable for outcomes. Beaches with poor grades indicate regulators and the regulated are not achieving the clean water called for by law.

Statewide, the Commission found an alarming lack of easy-access information about water quality, and an equally alarming lack of focus on clean water outcomes by the water boards. While the state does maintain a list of impaired water bodies to fulfill Clean Water Act requirements, it is difficult for the public to use that list to discern whether water bodies are truly safe for swimming, fishing or other uses.

To address both of these issues, the Commission believes the state should create a report card system for water bodies across the state based on Heal the Bay's Beach Report Card. Publicly accessible, easy-to-understand letter grades for water bodies throughout the state would act as a scorecard for regional boards, by answering this simple question: Are programs working to protect and improve water quality?

The report cards could emulate the state Air Resources Board's Air Quality Index, which has become an important tool for the public in assessing whether air quality is safe or not. Water body report cards could eventually provide a similar tool.

This is a long-term project. More monitoring would be needed, and decisions would need to be made regarding grading formulas. While the Beach Report Card is geared toward whether ocean water is safe for swimming, other water bodies could be graded for fishing or other beneficial uses. This process could be organized by the state water board with assistance from an expert panel, such as the California Water Quality Monitoring Council, by a research institute such as the Southern California Coastal Water Research Project, or the University of California. The program could be tested on a pilot basis on significant water bodies with routine monitoring already in place, and then expanded.

Report cards eventually could be used by the state board to measure regional board effectiveness, and for policy-makers to determine where water quality improvement projects are most needed.

Integrating Science

The boards acknowledge the need for improving and integrating the use of science in their decision-making processes. In a 2005 report commissioned by the state board to improve the use of science and engineering within the boards, consultant William Vance spoke with numerous board staff and wrote, "In general, the Regional Boards acknowledge their limitations in scientific expertise … ." Recommendations in the report focus on "creating a means or mechanism that will enable the Regional Boards to obtain scientific advice and recommendations from technical experts not readily accessible today."[129]

Too often, this deficit leads to disputes about science and information, rather than a productive discussion on developing an appropriate policy.

Numerous recommendations for adding more science to water quality regulation have been made in the last few years. US Navy Rear Admiral Len Hering, Sr. told the Commission he thought the water boards should emulate the state Air Resources Board and develop its own research center to work on water quality problems and solutions. A report published in March 2008 by the California Ocean Science Trust listed 25 recommendations for improving links between academic scientists and the water boards, including building a directory of water quality experts with specific expertise to help regional boards find scientists to work with, designating a seat on the state board for a scientist, and reforming the contracting process to improve working relationships with outside scientists.[130]

The report by Vance listed four possible structural changes, all submitted by regional and state board staff:

- Set up "blue ribbon" science panels that would provide advice and guidance on complex scientific issues.
- Create a science advisory panel that would provide technical review, comment and suggestions on Regional Board field studies and interpretation of data.
- Create a pool of in-house experts that would be available to any of the Regional Boards on an as-needed basis (i.e., for expertise currently not available, such as economic analysis or risk assessment).
- Set up an expeditious mechanism for consulting or contracting with experts in other state, federal or local agencies on highly technical issues or projects.[131]

Comparing the Water Boards to the Air Resources Board

Several stakeholders told the Commission that the state's air regulators – the California Air Resources Board – were more effective, transparent and respected than the water boards, and the water boards should do more to emulate the Air Resources Board. In his testimony to the Commission, US Navy Rear Admiral Len R. Hering, Sr. suggested regulations proposed by the state's Air Resources Board and local air pollution control districts were more credible because of the air board's ability to conduct research showing that regulations were practical and effective.

"California's air program is known for a strict adherence to a science-based approach, including a state-operated research facility that leads the world in air pollution science and technology,'' he said. "Air regulators in this state uses science in all aspects, and include economic analysis as a key aspect of decision-making. Water quality regulations, on the other hand, do not have the same scientific basis."

The air and water boards are not easily comparable, but there are interesting differences in the two regulatory systems that could be instructive to efforts to improve the water boards.

The California Air Resources Board (CARB) and 35 local air districts regulate emissions in the state. The CARB is responsible for regulating emissions from mobile sources, such as vehicles, fuels and consumer products, while the local air districts regulate emissions from stationary sources in their districts, such as factories or oil refineries. The CARB consists of 11 members, each appointed by the governor, with the chairperson working full-time and the other members, who represent geographical areas in the state, specific professional backgrounds or the public, serving part-time. Local air districts have varying rules as to board membership, with most including local elected officials and only some members who are appointed by the governor.

Unlike the state water board, CARB rarely issues permits, and instead adopts quasi-legislative actions. Local air districts issue permits. There is less interaction between CARB and local air districts, as they are not a single, unified agency and CARB does not hear appeals of local air district decisions. CARB is charged with setting ambient air quality standards for air basins that local air districts must work to attain through their permitting and policies, however. Air regulators regulate fewer contaminants than do water regulators, and are charged with only addressing contaminants that affect human health. CARB has formally identified 22 toxic air contaminants requiring regulation, while the water boards deal with far more contaminants.

Resources also vary dramatically between the two regulatory sectors. The state Air Resources Board has about 1,200 employees – not including the state's 35 local air districts. The water boards – both the state boards and the nine regional boards – employ a total of about 1,600 people. Locally, the Central Valley Regional Water Quality Control Board has about 275 employees covering a region that includes more than 30 counties. In contrast, the San Joaquin Air District covers eight counties and has about 500 employees. One of CARB's key funding sources is the motor vehicle account, which includes a fee charged to every car owner in the state. The water boards lack a similar funding stream.

CARB has a far more extensive scientific research arm than do the water boards. State statutes require CARB to administer and coordinate all air pollution research funded by the state, conduct studies every three years on the feasibility of air quality models and other analytical tools used to determine air quality, and appoint a screening committee to provide the board with advice on needed research and review research projects. While the water boards also have statutes requiring the state water board to determine state needs for water quality research and administer research, the statutes are less specific. CARB also is required to prepare an assessment of the cost effectiveness of available and proposed controls on emissions and develop a list that ranks the possible controls from least cost-effective to most cost-effective. Water law requires the water boards to consider economics when developing water quality objectives, but the statute is not specific as to how that should be done. Thus, CARB typically conducts an extensive cost-benefit analysis of proposed regulations and has eight economists on staff, while the water boards rarely conduct a full cost-benefit analysis.

Pamela Creeden, executive officer, Central Valley Regional Water Quality Control Board. September 17, 2008. Personal communication with Commission. Health and Safety Code Division 26 Air Resources Part 2 Air Resources Board Chapter 4 Research, 39701, 39703, 39705. Health and Safety Code Division 26 Air Resources Part 2 Air Resources Board Chapter 3 General Powers and Duties, 39606, 39607, 39609. Water Code Division 7 Water Quality, 13161, 13162, 13241.

All of these ideas have merit.

The Commission believes the state can best improve its integration of science into the boards' regulatory programs by creating a science advisory board.

A science advisory board, appointed by the state water board, could help the state and regional boards determine where scientific research was needed, help the state board in acting as a clearinghouse for current scientific research, help the boards better incorporate research findings into regulatory proceedings and advise the state board on continuing education options for staff scientists. The board, a five-member board of scientists and engineers paid a per diem for attending monthly public meetings, would help institutionalize the role of science in water board processes while also remaining independent of the boards themselves. The board could act as a liaison with outside scientists and regularly develop short- and long-term plans for scientific study.

Regional Science Institutes a Key to Better Science at Boards

Regional science institutes such as the Southern California Coastal Water Resources Program (SCCWRP) and the San Francisco Estuary Institute (SFEI) are invaluable to their respective regions. Both bring regulators, scientists and stakeholders together to propose and conduct relevant research:

- SCCWRP is a joint powers agency with 14 member agencies, including US EPA, the state water board and the Los Angeles, Santa Ana and San Diego regional boards, as well as several local government agencies. Each agency contributes funding, and a commission comprised of representatives from each agency meets quarterly to oversee impartial research that can be used in regulatory processes. SCCWRP's achievements and ongoing activities include regional monitoring, including a report issued every five years on the health of the Southern California shoreline; important research into the effects of aerial deposition on coastal waters; and research that led to the state water board's adoption of sediment quality objectives in 2008.
- SFEI also is a joint powers authority involving regulators, regulated entities, scientists and other stakeholders, including environmental groups. A board of directors guides research, including regional monitoring of San Francisco Bay; a wetlands science program; and studies on invasive species in San Francisco Bay.

The Commission believes every regional board in the state should be affiliated with a body similar to SCCWRP or SFEI. The advantages are numerous: Collaborations among regulators and the regulated over science can build consensus around the underlying scientific issues of regulations and therefore lessen conflict and build relationships and trust among regulators, water users and other clean water constituencies. Also, a semi-independent agency can conduct and contract for research in a faster timeframe than state government. While it is important for the water boards to have competent scientists on staff, board personnel are often overworked and these outside agencies can do more thorough work that may be more credible with all sides.

Regions such as Lahontan and the Colorado River could combine to help create an institute that might include partners in the southern part of the Central Valley board's jurisdiction. In the Central Valley, the board could work with the new Delta governance structure to develop a science institute for work there. The North Coast could create its own organization, which is suggested by the Ocean Science Trust report, or join the San Francisco Estuary Institute.

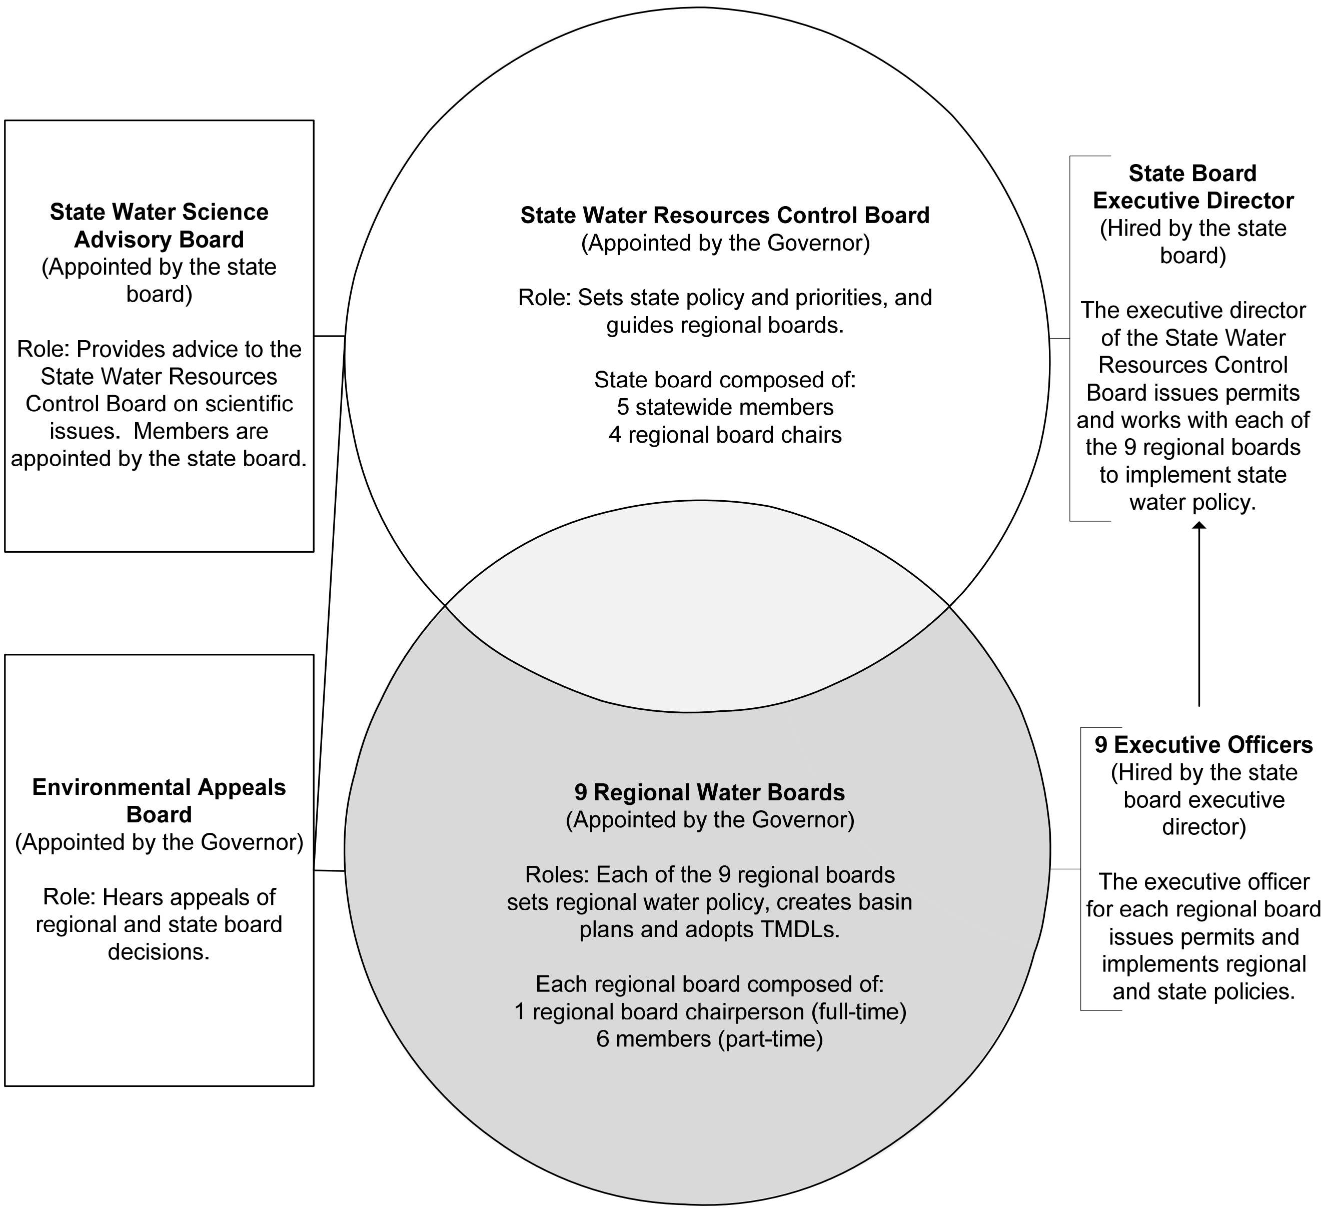
Proposed Water Board Governance Structure



The board would not conduct research on its own, but act as a science oversight body for the boards. This is not a call for a new bureaucracy – the board could use staff from the state board.

As the Commission was preparing this report, Governor Arnold Schwarzenegger's Delta Vision Blue Ribbon Task Force was preparing a strategic plan for the Sacramento-San Joaquin River Delta and a proposal for a new Delta governance structure. As part of the process, there was discussion about the role of science in helping guide research in the Delta. Two separate proposals – one by Jeffrey Mount and Judy Meyer of the CalFED Independent Science Board and another by a science advisor for the task force – both called for an oversight board to conduct annual reviews of all science aspects of Delta water and ecosystem management.[132]

The rationale for a science oversight board in the Delta in both proposals applies equally to the need for a similar board as an arm of the state water board. The Commission urges the state to consider creating one scientific board that could oversee both the Delta and other state water issues.

Organizing, Leveraging Data

Hundreds of entities across the state – state agencies, local governments and private agencies – collect water quality data. Yet one of the biggest complaints among board officials, staff and stakeholders is the water boards' inability to cohesively gather, publish and analyze data to help inform the public, determine if regulatory efforts are effective and to drive decision-making.

The Legislature has sought to address this problem in several ways:

- AB 1404, approved in 2007, requires the state water board to provide a report by January 2009 on the feasibility of creating an integrated data system focusing on water supply and involving the water board's Division of Water Rights, the Department of Water Resources and the Department of Public Health.
- SB 1070, approved in 2006, created the California Water Quality Monitoring Council to help develop a "cost-effective, coordinated, integrated, and comprehensive statewide network for collecting and disseminating water quality information and ongoing assessments of the health of the state's waters and effectiveness of programs to protect and improve the quality of those waters."

- AB 1747 and SB 1049, approved in 2003, required any group receiving funding from Proposition 50 for water quality improvements to also monitor affected waters to determine a project's effectiveness. The legislation required that the monitoring data be compliant with the state's Surface Water Ambient Monitoring Program so that the data could be integrated and compared.

These efforts point toward the need for a statewide system that can coordinate water data from multiple sources and provide the public, policy-makers, regulators and others with useful information.

The state needs a water data library.

In its strategic plan, the state water board advocates for the creation of a statewide water data institute: "To improve transparency and accountability by ensuring that Water Board goals and actions are clear and accessible, by demonstrating and explaining results achieved with respect to the goals and resources available, by enhancing and improving accessibility of data and information, and by encouraging the creation of organizations or cooperative agreements that advance this goal, such as establishment of a statewide water data institute."[133]

This is an idea that should be pursued. The data institute could use new technology allowing for a federated system, linking data through a data exchange network. Each data provider would be responsible for maintaining its data, but the data could be accessed through a common portal. Some in the water community and board officials including Gary Wolff, vice chairman of the state water board, suggest the data institute should be managed by a non-state entity to encourage buy-in from the numerous data providers. An institute could be housed in an existing entity, such as the Southern California Coastal Water Research Project or the San Francisco Estuary Institute, or controlled by the California Water Quality Monitoring Council created by SB 1070.

This is a big task, as it would require hundreds of data gatherers to agree to standardized monitoring protocols and quality assurance, and allow their information to be used by others. It also would require a stable funding stream. But a coherent, easily-accessible library of data on water quality – and water use – would be a powerful tool for a state that faces profound water challenges in the future.

Updating Basin Plans

Nothing undermines the water boards' credibility and adds uncertainty to the regulatory process as much as outdated basin plans. While the boards do make minor changes to the basin plans every three years, and add TMDLS to them as they are adopted, the last major update, in the mid 1990s, preceded the increase in non-point source regulation. Many controversies and conflicts at the regional board level stem from regional boards' efforts to implement non-point source regulations using a basin plan that does not truly address the specificities of non-point source water pollution, which is different than point source water pollution. Regulated entities have a legitimate argument that regulation should be tailored for stormwater, irrigated agriculture and other non-point sources.

With the core regulatory document silent on some of the biggest water quality issues in the state, the regional boards are regulating in the dark.

The Commission heard compelling testimony from officials with the Santa Ana Regional Water Quality Board, regarding a multi-year, multi-stakeholder effort to revise that region's basin plan.

Concerns in 1995 that water quality objectives related to nitrate-nitrogen and salts would require dischargers to spend billions of dollars and might also discourage water recycling, the Santa Ana board created a task force to review the objectives to assure their technical and scientific validity. Twenty-two water supply and wastewater agencies participated, eventually contributing $3.5 million to a process that involved significant research. Regional board staff, including the executive officer, participated in nearly 100 meetings as the task force prepared a major overhaul of several aspects of the regional board's basin plan.[134]

According to written testimony supplied to the Commission by Santa Ana Regional Water Quality Control Board chairwoman Carole Beswick, keys to the task force's success included extensive discussions in the beginning of the process regarding the science needed, and the buy-in from all task force members that they would abide by regulations imposed by scientific findings. In other words, stakeholders agreed to go where the science took them.[135]

In 2004, the regional board approved significant changes to its basin plan based on the task force's work, including revised boundaries for ground water subbasins and new water quality objectives for nitrate-nitrogen and salts in those ground water boundaries; new water quality objectives for other contaminants, such as chloride and sulfate; and new wasteload allocations for discharges of nitrogen and salts to the Santa Ana River. In all, 10 major aspects of the basin plan were updated.[136]

Gerard Thibeault, executive officer of the Santa Ana regional board, described the task force process to the Commission, and noted that when the basin plan updates were enacted, there was no dissenting testimony. Thibeault emphasized the importance of the task force's meetings, where regional board staff and stakeholders were able to hash out differences in lengthy conversations. During public hearings before the board, speakers often are limited to a few minutes.

"It is difficult to try and argue very complex technical issues in front of the board when all of the stakeholders have polarized positions," he said. "The task force allowed those arguments to be worked out."[137]

The Santa Ana region has unique characteristics that may have allowed it to gain unanimous support for basin plan changes that might be more difficult in other regions. It is the state's smallest region geographically. And a joint powers agency, the Santa Ana Watershed Project Authority, has effectively promoted collaboration among stakeholders in the region.

Nonetheless, other regions should emulate the Santa Ana region to update their basin plans. The state board should promote the idea and help facilitate regional board basin plan update task forces. Given the state's budget deficit, it seems unlikely that the state will be able to pay for the work needed to update basin plans. Thus, water users and others with a stake in clean water will need to contribute. While it is an upfront cost, stakeholders will benefit in the long run by avoiding lengthy disputes over permits and other conflicts that result from outdated basin plans.

Developing current basin plans is the most critical task facing the water boards.

Solving Problems

The state and regional water boards face an expanding set of threats to water quality at the same time that the state is grappling with water supply issues fueled by climate change, population growth and a continuing dispute about the best ways to deliver water from north to south.

Throughout its study, the Commission found the boards too often focused on processes instead of results. The boards must reposition themselves from regulatory agencies to problem-solving agencies focused on clean water outcomes. This will require three important steps: working more collaboratively with stakeholders and other federal, state and local agencies; focusing on watershed health; and incorporating cost-effectiveness tests into their analysis to help determine the best ways to approach water quality problems.

A collaborative approach. While the boards do follow state law and have public participation processes for virtually all of their proceedings, many stakeholders complained that the boards do not work in a collaborative manner. This is despite examples of collaboration that have been productive:

- ***Brake Pad Partnership.*** Since the 1980s, studies showed high levels of copper in the southern portion of San Francisco Bay. Copper contamination continued in the Bay even as nearby wastewater treatment plants reduced copper discharges 10-fold. Continued monitoring and studies showed that area stormwater had unusually high levels of copper, and research was able to pinpoint a source for that copper: automobile brake pads. Every time cars brake, bits of copper in brake pads land on streets. That copper is washed away during storms. Faced with the near-impossible task of regulating automobile brake pads, which have design specifications mandated by the federal government, the San Francisco Bay Regional Water Quality Control Board and Bay Area stormwater managers decided to approach the brake pad industry to work on voluntary changes. A coalition of stormwater managers, environmental groups, board staff and some brake pad manufacturers was formed, with each contributing funding to further study the issue. The Brake Pad Partnership generated new research on copper in the Bay, including studies that allowed the Regional Board to relax limits on the amount of copper in the Bay while still upholding beneficial uses. The group is now preparing legislation that could impose new state restrictions on the use of copper in brake pads that will have some industry support.[138]
- ***Santa Ana Stormwater Quality Standards Task Force.*** Attempts to create water quality objectives for bacteria in water used for recreation created controversy in the Santa Ana region, so the

board agreed to create a stakeholder task force to look at the issue. Five entities are funding the task force, with no money coming from the regional board. A total of 54 agencies and organizations, including environmental groups, are participating. The task force began with three principles: new objectives and beneficial uses would be science-based, within current law, and all task force members agreed to support the new science-based objectives and standards even if it meant they would be more stringent. The task force has met monthly and took a creative approach to determining the beneficial uses of some water bodies: They set up video cameras at 12 locations to determine whether people were using them for recreation or not. Changes may allow some water bodies that are not used for recreation to have less stringent standards, in exchange for tougher standards where those water bodies meet receiving waters that are used for recreation. This will allow regulated entities to spend more time and money on waters with higher-priority uses. Basin plan amendments are expected to be completed in 2009.[139]

- ***Water Plan Update Steering Committee.*** In the past, the Department of Water Resources took sole responsibility for creating the Water Plan, which is the state's master plan for water. For its 2009 update of the Water Plan, however, DWR has created a Steering Committee of 19 state agencies, including the water boards, to better integrate water supply, water use efficiency, water quality, flood management planning and environmental stewardship into the plan. The Steering Committee is working together on nine Water Plan items, including recommendations on how to adapt to climate change and updating and expanding regional reports. DWR officials believe the committee will improve the Water Plan by including more attention to non-DWR issues, but also build inter-agency relationships to better address future water issues.[140]

Within the water boards, the boards must do a better job of working with stakeholders and the public to solve problems. The traditional method of issuing permits and requiring dischargers to monitor themselves is not as effective in dealing with non-point water pollution problems that have diffuse, hard-to-regulate origins. For example, because stormwater pollution is caused in part by individual actions, public education may play a key role in addressing the problem. In addition, stormwater permit processes that require stormwater agencies to develop best management practices to address stormwater pollution often do not include enough interaction between the boards and agencies to determine program effectiveness during the five-year life of a typical permit.

In an address delivered to the California Stormwater Quality Association in 2006, consultant Armand Ruby proposed annual meetings between regulators and stormwater agencies in which the two parties could consider monitoring data, determine the contaminants they were most concerned about and develop strategies to address those concerns.[141] This does not often happen.

"More time and attention should be paid to getting the public and the regulated community and the regulators into a room to talk, rather then just having three minutes of testimony from each side at a hearing," noted Linda Sheehan, executive director of California Coastkeeper, at one of the Commission's public hearings.

In 2008, the state water board's effort to develop a statewide water recycling policy may have helped create a new model for policy development. With near unanimous dissent among stakeholders regarding a recycling policy proposal created by state water board staff, stakeholders agreed to work together and develop a policy that they would then propose to the board. After several months, the stakeholder group – which consisted of environmental groups, municipal wastewater treatment groups and the Association of California Water Agencies – created a 13-page proposal that all sides agreed on. The proposal suggested new goals for the use of recycled water in the state, called for state- and stakeholder-funded basin plan updates dealing with salt and nutrient issues, a streamlined permitting process to encourage recycled water projects, and the creation of an expert panel to advise the state on how to handle emerging contaminant issues that might affect wastewater and efforts to clean and recycle wastewater.

Boards should use this model to develop future policies.

Other sources of pollution will require more cooperation and collaboration among the water boards and other government agencies.

The state has taken a small step toward addressing air pollution that contaminates water. In February 2006, the state water board and the Air Resources Board met in a joint hearing to discuss aerial deposition and water pollution. The board heard presentations on research suggesting, among other things, that wood burning stoves contribute to Lake Tahoe pollution and emissions from cement kilns contribute mercury to the San Francisco Bay.[142]

While more studies are needed, existing research is clear: Air pollution does impact water.

While the initial meeting between the two state boards was positive, no subsequent meetings have been scheduled. The boards should meet again, and perhaps annually, to begin determining how best to address this difficult situation. Should the water boards begin regulating power plants, automobiles and other sources? Should the air boards expand their scope, from regulating 22 toxic air contaminants the directly impact human health, to other contaminants that impact water? How should regional boards and local air districts work together to address localized issues?

In its report on the boards' use of science, the California Ocean Trust noted several scientific questions regarding air pollution's effects on water quality that needed addressing:

- Developing studies and determining the impacts of atmospheric deposition pollutants on water quality and how to address this in TMDLs.
- Developing conceptual frameworks and models to determine how these systems interact and effect water quality.
- Determining pollutant loads in water from air- and land-based sources.[143]

These questions and issued need to be addressed, and state environmental officials should be working on solutions.

California needs a broad discussion of the impact of land development on water quality that is potentially beyond the scope of the water boards. As California's economy grows and changes, agricultural land is lost and urbanization increases, these issues will increase in importance.

Low Impact Development a Key Response to Stormwater

As the water boards have attempted to improve regulation surrounding urban stormwater, they have begun to focus more on low impact development (LID) as both a key to reducing stormwater discharges and as a potential source of recycled water. The state, as a whole, should continue discussing ways to encourage and improve LID.

The goal of LID is to maintain the hydrology of a development site even as development occurs. LID attempts to hold water on site through water storage and infiltration with the ground. Examples of LID include rooftop gardens on public buildings, rain barrels that catch rain water for reuse, permeable pavement and other methods that decrease the imperviousness of an area that often occurs when it is developed into an urban use.

LID marks a profound change in urban development. Past practices focused on moving water from rain storms quickly away from development to prevent flooding. In Los Angeles, for example, engineers designed concrete channels to convey large volumes of water from occasional but fierce rain storms.

The water boards and other state agencies have made efforts to promote – and require – LID:

- ***Central Coast LID Center.*** Using $2.25 million from the state board, the Central Coast Regional Water Quality Control Board helped develop the Central Coast LID Center, which opened in 2008. The non-profit, affiliated with an already-existing LID center in Maryland, opened in San Luis Obispo in 2008, and will develop technical expertise for the state on LID, provide education and outreach on the topic and serve as a library for research on the issues.
- ***LID Education Project.*** Developed by the water boards, the Coastal Commission and several other groups, including the California Stormwater Quality Association, the project is intended to hold workshops and promote LID throughout the state to local government officials, state officials, developers and others. The project, which was just launched 2008, is seeking to raise more than $2 million to pay for the workshops and other efforts.
- ***LID Regulations.*** Both the state water board and some regional boards have begun to require LID in permits. The San Francisco Bay Regional Water Quality Control Board, for example, is requiring in stormwater permits that new development maintain pre-development erosion levels, while the San Diego Regional Water Quality Control Board in its stormwater permits is requiring all new development and redevelopment projects to implement LID where feasible. Other boards are beginning to place numeric limits on development sites, limiting the amount of impervious surfaces in new development.

The construction industry and municipalities have objected to some of the boards' more aggressive efforts to require LID, arguing that it can increase design and construction costs. In addition, local governments may need to review decades-old ordinances: The city of Lompoc, for example, found that ordinances required impervious concrete in parking lots, which conflicted with Central Coast Regional Water Quality Control Board's requirements to dramatically decrease imperviousness.

Despite these conflicts, most stakeholders agree that LID is an essential tool to addressing stormwater pollution. In addition, LID may help local communities retain and eventually reuse water by recharging ground water basins. A 2005 report by the Los Angeles and San Gabriel Rivers Watershed Council noted that 500,000 acre-feet of stormwater runoff flow from the Los Angeles County basin to the ocean each year. The report noted that if the region could instead capture that water and reuse it, Southern California would be less dependent on water imports from Northern California.

There are already statutes in place that could be used to increase state government collaboration:

Environmental Policy Council. Section 71017 of the Public Resources Code creates the California Environmental Policy Council, which is comprised of the secretary of Cal/EPA and the heads of the other agencies within EPA, including the chairperson of the State Water Resources Control Board. The council was created to provide guidance for entities seeking a consolidated permit from multiple environmental regulators. It met in 1999 to help resolve issues relating to oxygenate methyl tertiary-butyl ether (MTBE), which was added to gasoline to mitigate air quality problems from gas but was later found to harm water quality.

The council could be used to help address cross-media pollution issues affecting water quality.

Environmental Goals and Policies Report. Enacted by Governor Ronald Reagan in 1970, the Environmental Goals and Policies Report is intended to outline the state's goals as they relate to land use, population growth and distribution, development and conservation of natural resources, including air and water quality. The report is supposed to be produced by the Governor's Office of Planning and Research, reviewed by the Legislature and approved by the governor every four years. It has only been issued twice in 38 years: once in 1978 and again in 2003. The 2003 report, however, was published the same month that Governor Gray Davis was recalled and failed to generate comment or reaction from the Legislature or Governor Arnold Schwarzenegger.

The 2003 report detailed expected population and economic trends, and how those trends could impact everything from air and water quality to agricultural land and open spaces to human health and energy resources. The report also included 58 broad and specific goals for improving sustainable development in the state, including promoting infill development in cities, preserving water quality through watershed protection efforts and encouraging development that supports public transportation possibilities.

Governors of both parties simply have ignored the statute calling for this report. And while some of the issues that could be raised in this report are addressed in other ways – Governor Arnold Schwarzenegger has convened the Climate Action Team, consisting of multiple state agencies, to work on achieving greenhouse gas reductions, for example – an updated version of this report could help the state frame water quality priorities for the future, particularly as they concern urban stormwater and other non-point pollution sources.

Focusing on watershed health. The state board's new strategic plan emphasizes the boards' need to focus on watersheds as a critical way to improve water quality. "A watershed approach is hydrologically-focused, recognizes the degree to which ground water and surface water bodies are connected physically, recognizes the linkages between water quantity and water quality, and requires a comprehensive watershed protection approach," reads the preamble to the strategic plan.[144] A key action item in the plan requires the state board to identify priority watersheds and focus resources on impairments in those watersheds.[145]

National efforts underway to promote watershed-based planning and regulation can be used as examples. The National Research Council's report on stormwater, issued in October 2008, recommends that the EPA scrap its current stormwater permitting program in favor of regulating on a watershed basis. The report proposes moving from a site-by-site and stormwater permitting process to a permitting process that focuses on broad goals within a watershed and would include point source dischargers and non-point source dischargers.[146]

The National Research Council suggests integrating all discharge permitting under a municipal authority, which would be the lead permittee, and then identifying broad goals and objectives for the watershed and specific solutions for restoration and protection. The report notes that federal funding would be required to help implement such a major change, which includes folding the TMDL program be folded into the new permitting system as well.

Some states, notably Oregon, already have experimented with watershed permitting. Oregon's use of the watershed permitting concept led to a creative solution to addressing water impairment due to temperature, which affects the state's salmon. A discharger emitting heated water into the Tualatin River was allowed to plant trees that created shade and cooled water along the river. The alternative would have required building an expensive system to cool the discharges that would have contributed to climate change.[147]

Watershed-based Permitting

According to the National Research Council, components of watershed-based permitting would include:

- Centralizing responsibility and authority for implementation with a municipal lead permittee working in partnership with other municipalities in the watershed as co-permittees.
- Adopting a minimum goal in every watershed to avoid any further loss or degradation of designated beneficial uses within the watershed's component water bodies.
- Assessing water bodies that are not providing designated beneficial uses in order to set goals aimed at recovering these uses.
- Defining careful, complete, and clear specific objectives to be achieved through management and permitting.
- Comprehensive impact source analysis as a foundation for targeting solutions.
- Determining the most effective ways to isolate, to the extent possible, receiving water bodies from exposure to those impact sources.
- Developing and appropriately allocating funding sources to enable the lead permittee and partners to implement effectively.
- Developing a monitoring program composed of direct measures to assess compliance and progress toward achieving objectives and diagnosing reasons for the ability or failure to meet objectives, in support of active adaptive management.
- Developing a market system of trading credits as a tool available to municipal co-permittees to achieve watershed objectives, even if solutions cannot be uniformly applied.

Source: National Research Council. October 15, 2008. "Urban Stormwater Management in the United States. Page 391. Washington, D.C.

US EPA commissioned the stormwater study, and may attempt to implement a watershed approach in coming years. With this new federal focus in mind, the state and regional boards should emphasize watershed health by creating a new focus on how regulations affect watersheds. The Central Coast Regional Water Quality Control Board has begin this process by creating a new performance measurement structure focused on healthy watersheds.

Strategies the boards could implement include redeploying staff to place more emphasis on watershed health, increasing the use of regional monitoring to get a better sense of the overall state of watersheds, and working more closely with local watershed coalitions or convening watershed stakeholder groups. State law allows regional water boards to direct public agencies to conduct studies of issues affecting water quality, and in a presentation to state and regional board members in October 2008, Richard McMurtry of the Santa Clara County Creeks Coalition suggested using that authority to require all dischargers into a watershed to pool resources, study the watershed and develop priorities and strategies for addressing watershed-wide issues. This could be a step toward watershed permitting.

Legislation supported by the Building Industry Authority in 2008 authorized counties or cities to convene water quality committees to "develop and facilitate cooperation in achieving local water quality solutions" and develop watershed water quality management plans. The legislation would have required regional boards to consider the plans as amendments to their basin plans. The legislation, AB 938 by Assemblyman Charles Calderon, was approved by the Assembly but failed to pass in the Senate.

This is an arena where the board can and should exercise leadership on their own and convene watershed quality committees to provide input to the boards and, working with the EPA, begin considering pilot projects to implement watershed permitting.

Focusing on watershed health should help the boards focus more on solving water quality problems and on outcomes.

Central Coast Board Shifts Focus Toward Outcomes

Concerned that too much emphasis was placed on processes instead of outcomes, the Central Coast Regional Water Quality Control Board has developed a new performance measurement strategy to emphasize clean water outcomes and measure progress toward those outcomes. Through public meetings and internal staff meetings, the board created an overall vision statement for the agency and three specific, measurable goals. Four teams are working on achieving the goals, with staff from each program area involved in each team to ensure that changes happen system-wide. Staff is allowed to spend about 10 percent of their time on the project. Three of the teams are working on one of the specific goals, while the fourth team is charged with assessing the overall effectiveness of the new strategy.

The project has already led the board's agricultural program to begin comparing growers' monitoring reports, water quality data for nitrate and toxicity in streams, pesticide use information and inspection information to determine overall water quality. It is the first time the board has used Geographic Information System tools to link area land use and water quality data.

The board's vision is "Healthy Functioning Watersheds," and the three goals, along with some ways the board will measurement achievement of the goals, are:

- ***By 2025, 80 percent of our aquatic habitat is healthy and the remaining 20 percent exhibits positive trends in key parameters.*** The board seeks to ensure all agriculture lands have riparian buffers, ensure open space preservation in all important groundwater recharge areas and ensure that all new developments and redevelopment projects are designed to minimize runoff and maximize groundwater recharge. The board will likely develop a basin plan amendment to protect riparian and wetland habitat.
- ***By 2025, 80 percent of lands within any watershed will be managed to maintain healthy watershed functions, and the remaining 20 percent will exhibit positive trends in key parameters.*** The board will measure the percent of impervious surfaces in the region and seek ways to reduce those surfaces, and measure toxicity in runoff and seek to reduce toxicity. Long term, the board will study trends in water quality based on land development and incentivize groundwater recharge and water recycling projects.
- ***By 2025, 80 percent of our groundwater will be clean, and the remaining 20 percent will exhibit positive trends in key parameters.*** The board will measure groundwater nitrate concentrations and salt to determine effectiveness, work on basin plan amendments for groundwater recharge area protections and work with dischargers to groundwater on development of site-specific salt management plans.

And Central Coast Regional Water Quality Control Board. June 4, 2008. "Staff Report for Regular Meeting of June 4, 2008. Status Report on Regional Board Vision and Measureable Goals." San Luis Obispo, CA.

Considering Economics. Porter-Cologne requires the water boards to consider the economic consequences of regulations when they set water quality objectives, and states that "waters of the state shall be regulated to attain the highest water quality which is reasonable, considering all demands being made and to be made on those waters and the total values involved, beneficial and detrimental, economic and social, tangible and intangible."[148]

The statute, however, provides scant guidance on how the boards should specifically consider economic or other factors as they determine appropriate regulations. In addition, a state appeals court, in *City of Arcadia v. State Water Resources Control Board*, gave the boards significant leeway in determining how they consider the costs of a regulation.[149]

The state board has provided some guidance to regional boards as to how to consider the economics of water quality objectives through the board's administrative manual, but the Commission's questioning of regional board officials at its April 2008 hearing illustrated that the boards do not have a thorough or consistent process to determine the costs of new rules, nor do they attempt to determine the most cost-effective ways to solve water quality problems.

One former regional board member, Terese Ghio, told the Commission that she felt like the board gave very little thought to cost.

"Cost-benefit analysis was never really vetted," said Ghio, who was a member of the San Diego Regional Water Quality Control Board for four years. "It's talked about, the box is checked, but it's never really done."[150]

This approach contrasts to the federal government, where US EPA has a lengthy history of using cost-benefit analysis in decision-making. Both Presidents Reagan and Clinton issued executive orders requiring cost-benefit analysis in EPA regulations, indicating bi-partisan support for the concept.[151] The EPA's manual, "Guidelines for Preparing Economic Analyses," is a lengthy document detailing the agency's process for establishing the costs and benefits of regulations.

A formal cost-benefit analysis can be time-consuming and expensive. At the very least, the state and regional boards should use cost-effectiveness tests as they analyze their regulatory actions – such as water quality objectives and TMDLs. Ranking options by cost-effectiveness can help set priorities and find strategies that provide the most benefit in terms of protecting and improving water quality. Porter-Cologne's requirement that regulations be reasonable suggests that the board should have a standardized procedure to analyze the potential costs of regulations, as well as some indication of the value of the potential benefits the regulations would produce.

In a 2006 paper entitled, "A Guide to Consideration of Economics Under the California Porter-Cologne Act," economists David Sunding and David Zilberman of University of California at Berkeley present their proposal for a economic evaluation process that can be used by the boards. Their proposal does not call for a full-scale cost-benefit analysis; instead it provides a method for the boards to gather information and provide a clear statement for the boards' rationale in setting regulations.

Adopting this process would improve transparency in the boards' decision-making process, allow the boards more information as they adopt regulations and instill more confidence among stakeholders in board decisions. Cost-effectiveness analysis could also help set priorities.

The Clean Water Act prohibits using excessive cost as a reason for not implementing a water quality standard or a TMDL, and the Commission is not advocating for the elimination of regulations simply because they are expensive. But adopting a formal process to analyze the costs of a regulation will provide the board with more information; boards are free to consider other issues in adopting regulations.

In its report, the Ocean Science Trust noted: "Cost-benefit analysis of present regulatory, management, and remediation measures

Proposed Economic Analysis for Water Boards

In a 2006 paper, University of California professors David Sunding and David Zilberman proposed that the state and regional water boards conduct, at minimum, a relatively quick economic analysis before imposing new regulations. The professors presented an eight-step process:

- A listing of the affected parties, including private industry and government agencies, together with a qualitative description of the impacts.
- Solicitation of data from the public regarding potential compliance and related costs for the proposed policy.
- The public's reported cost of compliance in relation to the revenue, cost, and profit margin of affected firms, and relative to the total budget of affected public entities.
- A statement of what the board staff thinks the costs are likely to be that specifically considers the data solicited from the public and the reasons for the board's estimate.
- A statement of potential factors that could affect the estimate, such as technological uncertainties, monitoring limitations, etc.
- A description of competitive conditions in the affected sectors, and an assessment of whether water quality regulations are likely to place California firms at a significant competitive disadvantage.
- A statement of the average time needed to obtain permits from the various boards, and a qualitative assessment of the impacts of delay.
- A statement of the goals to be achieved by the proposed regulation and an explicit consideration of these goals given the costs (i.e, at least a statement that "the board believes that $XX million represents a reasonable expenditure to achieve YY.") This description would include the types and numbers of beneficiaries, and an identification of other investments beyond those resulting from the regulation that are needed to produce the beneficial uses.

could assist the water boards in choosing the most effective use of limited resources to improve water quality."[152]

Summary

With California facing inevitable population growth, the climate change threat and the collapse of the Sacramento-San Joaquin River Delta, the need for clean water has never been greater.

Created nearly 40 years ago, the current governance structure to ensure clean water is outdated and in need of reform. The governor, Legislature and water quality regulators must act now to restore consistency, transparency and accountability to the state and regional water boards. A more unified board system that can identify statewide priorities and implement them at the regional level is essential. This new system, with up-to-date basin plans, a commitment to the use of science and data, and willingness to seek creative solutions to solve modern water quality problems, can be a key player in the state's future.

A failure to act endangers both the environment and the economy.

Recommendation 1: To move toward a more consistent, transparent and accountable governance structure that allows for both statewide policy and regional flexibility, reform the State Water Resources Control Board and the Regional Water Quality Control Boards by strengthening ties between the boards, refocusing the boards on broad policy-making and restoring confidence in the appeals process. Specifically, the state should:

- ❑ Restructure the State Water Resources Control Board as a full-time, 9-member board charged with creating state policy, setting priorities and overseeing regional board activities. Members of the board should be appointed by the governor and confirmed by the state Senate. Five members of the state board would serve solely as state board members, including one person who would be chairperson of the state board, as named by the governor. These members should have the following backgrounds: One in engineering, one in water rights law, one in water quality, one in water-related science or resource economics, and another would represent the public. The position of regional chairperson would become full-time. Four regional chairpersons would serve on the state board for staggered, two-year terms, with membership rotating among all nine regional board chairpersons.

- Reconstitute the nine Regional Water Quality Control Boards as seven-member boards with six part-time members and a full-time chairperson, all appointed by the governor. The chairperson would be charged with monitoring statewide policies that are implemented at the regional level. Boards would continue to be stakeholder-boards, with six part-time members with the following backgrounds: experience in water supply, conservation or production; irrigated agriculture; industrial water use; local government; water science or engineering; and experience with a nongovernmental organization associated with recreation, fish or wildlife. Regional boards would focus on updating basin plans, adopting total maximum daily loads and other quasi-legislative functions.

- Empower the executive officers of each Regional Water Quality Control Board and the executive director of the State Water Resources Control Board to issue permits, allowing the boards to focus on updating basin plans, setting broad policy and focusing on upcoming water quality challenges. Executive officers would become Career Executive Assignment positions and report to the executive director of the State Water Resources Control Board. Regional boards would conduct an annual evaluation of the executive officer that would be taken under advisement by the executive director.

- Exempt state and regional board members, regional board executive officers and the state board executive director from ex parte rules within the state Administrative Procedure Act that prohibit interaction with regulated entities. Instead, require board members and permit-issuing executives to disclose their contacts with regulated entities at public meetings, as is currently done by other boards such as the Integrated Waste Management Board.

- Create a new appeals board that would address appeals of quasi-adjudicative functions such as permits and enforcement actions. Removing the appeals process from state board jurisdiction would restore confidence in the process and allow the state board to take a more proactive approach in regional board issues. The members should have backgrounds in water issues and would be appointed by the governor to hear appeals. The board would follow Administrative Procedure Act policies in conducting hearings.

Recommendation 2: The state must improve and increase its use of data, scientific research and planning to better inform the public, respond to current and future water quality problems and focus more on accountability. Specifically, the state should:

- Create a Water Science Advisory Board for the State Water Resources Control Board. Members, appointed by the state board, should have backgrounds in environmental science and engineering. The board would help both the state and regional water boards and other state water agencies coordinate research, propose needed research, advise the boards on how to incorporate research into regulatory processes and increase the effectiveness of scientific peer review.
- Create an independent Water Data Institute that would act as a state library for water quality and supply data. The institute would pool information from various state agencies and other water monitoring groups to provide accessible information to the public, regulators and researchers.
- Develop report cards. Report cards for each major water body should allow the public easy access to information they can use and could act as a way to hold regional boards accountable for their effectiveness. The report cards should be developed and published by regional science institutes or an independent entity, such as the University of California.
- Launch a statewide effort to ensure that all regions have up-to-date basin plans. Regional boards should propose stakeholder-financed efforts similar to the one conducted by the Santa Ana Regional Water Quality Control Board.

Recommendation 3: The state must increase focus on clean water outcomes and emphasize collaboration, creativity and problem-solving to address current water quality problems. Specifically, the state should:

- Collaborate with other government agencies. Because land use, automobile emissions and other factors outside the traditional purview of the water boards are major contributors to non-point source pollution of water, the water boards must work with other government agencies on solutions. The state water and air boards should routinely meet to develop regulatory strategies to address air pollution's effects on water. The state should revive the Environmental Protection Council, which already exists in statute and consists of the heads of each of the boards and departments within Cal/EPA.

- Emphasize a watershed approach. To increase focus on outcomes and solving complex problems, the water boards should develop more processes aimed at watershed health.
- Use stakeholder task forces. As the Santa Ana Regional Water Quality Control Board has done, other regional boards should increase the use of stakeholder task forces to work through difficult regulatory issues.

Recommendation 4: The water boards must develop standardized economic analysis procedures to help set priorities and determine the most effective and efficient means to improve water quality.

- To fully implement Porter-Cologne's demand that water quality regulations be reasonable, given other economic and social factors, the boards must institute the use of economic analysis into decision-making. Cost-effectiveness analysis also would increase transparency of board decision-making and help the boards set priorities.

Conclusion

California's state and regional water boards have a profound impact on the environment and the economy. The boards issue more than 50,000 discharge permits, regulating the state's biggest metropolises as well as its smallest wastewater treatment plants. Theirs is an enormous and challenging task: implementing ambitious and complicated federal and state laws, incorporating the still-evolving scientific understanding of pollution's causes and solutions and working with limited resources.

This job, however, is critical to the state's future. Demand for water grows with population growth. Water supply is threatened by climate change and the potential for earthquakes to destroy the state's levee system. Pressures are mounting on the state to improve the health of the Sacramento-San Joaquin River Delta, protect threatened fish species and restore waters around the state to ensure they are swimmable, fishable and drinkable.

Change is needed to help the boards meet their mission.

Regional decision-making – an idea first conceived for California water quality regulation nearly 60 years ago – remains a sound approach, as conditions in different water bodies merit different approaches and standards. But California needs a better way to set overarching state water quality policy, as well as a better way to implement policies that are important to the overall health of the state's water bodies.

This is nowhere more important than in the area of non-point source pollution. The current system is based on the outdated model of combating source pollution, where emitters could be easily identified and their actions modified though the permit process.

The Commission found a critical need for a more unified regulatory agency that has clear priorities and procedures that can be implemented throughout the state. While current statutes give the State Water Resources Control Board ample authority to direct the nine Regional Water Quality Control Boards, in practice the regional boards are too independent, with differing policies and processes on even some of the most important statewide issues.

The current structure has not produced a clear ranking of its water quality priorities, the first step in matching resources and action to the state's biggest water quality threats. The process for setting policy offers little transparency and little emphasis on accountability or outcomes.

Given the tools that exist, it is unacceptable that the public and policy-makers do not have easy-to-understand information to answer the most basic questions for water quality policy: What is the state of the state's waters, and which water board programs are effective at improving water quality and which are not?

Until the boards, starting with the state board, shift their focus from process to outcomes, the answers to these questions will remain elusive.

Other problems also limit the boards' effectiveness: Regional board members face too many technically difficult decisions, preventing them from focusing on broader policy issues. The boards have struggled to collect and use data, and there is no state-led clearinghouse of scientific research or analysis indicating the best ways to tackle modern water quality problems.

Structural solutions to these problems lie in strengthening the relationship between the state and regional boards, re-focusing gubernatorial appointees on big-picture problems and solutions, reforming the appeals process, creating more avenues for the boards to use science and economic analysis in rule-making, and developing a statewide water data institute to coordinate water quality data gathered throughout the state.

These changes should re-focus the boards on setting priorities with the goal of protecting and improving California's waters. Ultimately, the boards' effectiveness should be measureable by whether its actions improve water quality.

Environmental regulation will always cause conflict, as regulators push for tougher standards, more protections, and, inevitably, more costs. Conflict at the water boards is not inherently a problem. But the Commission found too much conflict about process and not enough confidence that the boards' structure, policies and processes would lead to reasonable, effective solutions. The boards must evolve to rebuild that confidence. Change will be required too to begin showing more clean water success stories.

As the Commission conducted its study in 2008 of the water boards' governance structure, a task force appointed by Governor Arnold Schwarzenegger simultaneously was reviewing governance, water supply and environmental issues in the Sacramento-San Joaquin River Delta. The Commission's recommendations for a stronger, more proactive State Water Resources Control Board should not be in conflict with its earlier calls for a stronger governance structure for the state's management of the Delta. A strong state water board is essential to developing and implementing the policies that will help restore the Delta ecosystem and maintain water quality for not only the Delta, but the water transferred through it to the farms and cities of Central and Southern California.

The Commission's Study Process

The Commission initiated this study in early 2008 to review the governance structure regarding water quality regulation in the state and the relationship between the State Water Resources Control Board and the nine Regional Water Quality Control Boards. The Commission's goal was to assess the roles of the state and regional boards and the challenges facing the boards in their efforts to appropriately respond to the state's pressing water quality needs. As part of its study, the Commission investigated how to best balance the need for consistent statewide policy and the need for flexibility to handle regional issues. The Commission also explored the state's water quality goals and whether the state and regional boards have policies in place to reach those goals.

As part of the study, the Commission convened two public hearings. At the first public hearing, held in March 2008, the Commission heard from water quality regulators, including the chairwoman of the State Water Resources Control Board, two representatives of regional water quality control boards and the head of the United States Environmental Protection Agency's Region 9 water division. In addition, the Commission was briefed on the history of water quality regulation and the current roles of various state agencies in overseeing state water policy. At the second hearing, in April 2008, the Commission received input from representatives of regulated entities and environmental groups. Hearing witnesses are listed in Appendix A.

The Commission also convened two advisory group meetings during the course of this study. Both meetings included water quality regulators, representatives of regulated entities and environmental groups, legislative staff, and academics interested in water quality regulation. The first meeting, on May 21, 2008, focused on state water quality priorities and the advantages and disadvantages of the regional water quality control board system. The second meeting, on June 25, 2008, included discussion on the Water Quality Improvement Initiative and other possible changes to water quality governance in the state.

A subcommittee meeting, held on August 28, 2008, allowed the Commission to vet some ideas for reform through a group of water quality regulators and representatives of regulated entities and environmental groups.

A list of people who participated in the advisory group and subcommittee meetings is included in Appendix B.

Commission staff received valuable feedback from numerous stakeholders and other water quality experts, attended several State Water Resources Control Board meetings, one regional water quality control board meeting and the October 2008 meeting of the Water Quality Coordinating Council.

All written testimony submitted electronically for each of the hearings, and this report is available online at the Commission Web site, www.lhc.ca.gov.

Appendices & Notes

✓ ***Public Hearing Witnesses***

✓ ***Little Hoover Commission Public Meetings***

✓ ***Selected Acronyms***

✓ ***Notes***

Appendix A

Little Hoover Commission Public Hearing Witnesses

Witnesses Appearing at Little Hoover Commission Public Hearing on California's Water Boards, March 27, 2008

Carole Beswick, Chairwoman, Santa Ana Regional Water Quality Control Board

Lisa Beutler, Associate Director, Center for Collaborative Policy

Tam Doduc, Chairwoman, State Water Resources Control Board

Karl Longley, Chairman, Central Valley Regional Water Quality Control Board

Alexis Strauss, Director, Water Division, United States Environmental Protection Agency, Region 9

Witnesses Appearing at Little Hoover Commission Public Hearing on California's Water Boards, April 24, 2008

Chris Crompton, Manager, Environmental Resources Section, Orange County Public Works Department

Laurel Firestone, Co-Executive Director, Community Water Center

Terese Ghio, Vice President of Governmental Relations, Arena Pharmaceuticals

Rear Admiral Leendert "Len" R. Hering, Sr., Commander, Navy Region Southwest

Mick Pattinson, President, Barratt American Homes

Linda Sheehan, Executive Director, California Coastkeeper Alliance

Craig Wilson, Counsel, Community Alliance for Environmental Stewardship

Appendix B

Little Hoover Commission Public Meetings

California's Water Boards Advisory Committee Meeting – May 21, 2008

Desi Alvarez, Deputy City Manager, City of Downey

Arthur Baggett, Board Member, State Water Resources Control Board

Carole Beswick, Chairwoman, Santa Ana Regional Water Quality Control Board

Alf Brandt, Principal Consultant, Assembly Committee on Water, Parks and Wildlife

Kevin Buchan, Senior Coordinator, Bay Area Region and State Water Issues, Western States Petroleum Association

Tony Francois, Attorney/Lobbyist, KP Public Affairs

Craig Johns, Principal, California Resource Strategies, Inc.

Roberta Larson, Attorney, California Association of Sanitation Agencies

Phil Nails, Policy Consultant, Assembly Republican Caucus

John Robertus, Executive Officer, San Diego Regional Water Quality Control Board

Linda Sheehan, Executive Director, California Coastkeeper Alliance

Brian White, Vice President for Legislative Affairs, California Forestry Association

Craig Wilson, Counsel, Community Alliance for Environmental Stewardship

Gary Wolff, Vice Chairman, State Water Resources Control Board

California's Water Boards Advisory Committee Meeting – June 25, 2008

Nate Beason, Supervisor, Nevada County Board of Supervisors

David Beckman, Director, Coastal Water Quality Project, Natural Resources Defense Council

David Bolland, Senior Regulatory Advocate, Association of California Water Agencies

Alf Brandt, Principal Consultant, Assembly Committee on Water, Parks and Wildlife

Geoff Brosseau, Executive Director, California Stormwater Quality Association

Kevin Buchan, Senior Coordinator, Bay Area Region and State Water Issues, Western States Petroleum Association

Ken Farfsing, City Manager, City of Signal Hill

Randal Friedman, California Government Affairs, United States Navy Region Southwest

Mark Grey, Director of Environmental Affairs, Building Industry Association of Southern California

John Herrick, Counsel and Manager, South Delta Water Agency

Craig Johns, Principal, California Resource Strategies, Inc.

Roberta Larson, Attorney, California Association of Sanitation Agencies

Karl Longley, Chairman, Central Valley Regional Water Quality Control Board

Mark Newton, Director, Resources & Environmental Protection, Legislative Analyst's Office

Mick Pattinson, President, Barratt American

Dorothy Rice, Executive Director, State Water Resources Control Board

Brian White, Vice President for Legislative Affairs, California Forestry Association

Craig Wilson, Counsel, Community Alliance for Environmental Stewardship

California's Water Boards Subcommittee Meeting – August 28, 2008

Geoff Brosseau, Executive Director, California Stormwater Quality Association

Catherine Freeman, Senior Fiscal and Policy Analyst, Legislative Analyst's Office

Mark Grey, Director of Environmental Affairs, Building Industry Association of Southern California

Karl Longley, Chairman, Central Valley Regional Water Quality Control Board

Mark Lubell, Associate Professor, Department of Environmental Science and Policy, University of California, Davis

John Robertus, Executive Officer, San Diego Regional Water Quality Control Board

Linda Sheehan, Executive Director, California Coastkeeper Alliance

Gary Wolff, Vice Chairman, State Water Resources Control Board

Appendix C

Selected Acronyms

CARB: California Air Resources Board

Cal/EPA: California Environmental Protection Agency

Caltrans: California Department of Transportation

CEDEN: California Environmental Data Exchange Network

Re: Comment Letter– Tentative Order No.R9-2013-0001, Regional MS4 Permit, Place ID: 786088Wchiu."

Dear: Mr. Chiu,

On behalf of Building Industry Association of Southern California, Inc. (BIASC), Construction Industry Coalition on Water Quality (CICWQ) and the members of both, we appreciate the opportunity to provide comments on the San Diego Regional Water Quality Control Board Tentative Order No. R9-2013-0001; NPDES No. CAS0109266, National Pollutant Discharge Elimination System (NPDES) Permit and Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems ("MS4s") Draining the Watersheds within the San Diego Region (the "Tentative Order"). In addition, we respectfully request that our comment letter submitted to the Regional Board on September 14, 2012 be made a part of our overall comments to the Tentative Order and admitted into the formal administrative record, because the constructive suggestions for permit improvement remain relevant at this point in the Tentative Order development.

BIASC is a nonprofit trade association representing nearly 1,000 member companies, which together have nearly 100,000 employees. For decades, BIASC's members have built the majority of the new homes in Ventura, Los Angeles, Orange, Riverside, and San Bernardino Counties in southern California. CICWQ is an education, research, and advocacy water quality coalition comprised of representatives from five industry trade associations (in addition to BIASC) which are involved in the development of public and private building, infrastructure and roads throughout California (Associated General Contractors, Engineering Contractors Association, Southern California Contractors Association, Engineering and General Contractors Association, and United Contractors). All of the above trade associations, their members and the union labor work force are affected by the post-construction runoff control requirements proposed in the Tentative Order, and this letter is meant to provide the San Diego Regional Board with constructive suggestions for improvement.

We appreciate the Regional Board's earlier release of a precursor to the Tentative Order as an Administrative Draft, and the extensive stakeholder involvement process that ensued over the summer and autumn of 2012. Unfortunately, the Tentative Order does not reflect critically important changes to the Tentative Order's Development Planning requirements which we and many other public and private stakeholders recommended, both during the focused stakeholder meetings and in comments submitted to the Regional Board. Moreover, Regional Board staff does not provide sufficient findings of fact to support the priority project water quality and hydromodification control design criteria and performance standards in the Tentative Order. The requirements proposed in the Tentative Order are vastly different from those contained in the 2010 South Orange and South Riverside County MS4 permits, and there is simply insufficient performance data to demonstrate the need for any change.

We are concerned that key water quality and hydromodification control provisions within the Development Planning section (Section C.3) are (i) unsupported by substantial evidence, (ii) very bad public policy, and (iii) not properly considered as legally required. Specifically, certain provisions: (i) lack sufficient auditing or performance data showing the need for or advisability of such requirements, (ii) lack technical or scientific basis, and (iii) depart without any justification from required and approved technical documents that have been issued by the San Diego Regional Board for priority development projects in San Diego, Orange, and Riverside Counties. In addition, the hydromodification control provisions illuminate the Regional Board's failure to consider the factors required by California Water Code section 13241 – especially subsection (b) thereof.

1. There are no findings of fact to support changes in the requirements to evaluate, design and install LID BMPs (Section E.3.c) when comparing the proposed requirements in the Tentative Order with that of the requirements in the 2010 adopted South Orange and South Riverside County MS4 permits.

The Orange and Riverside County permits have been in effect for a short period of time (<2 years); and there is no data (program audits or annual report data, for example) that we can find that would support any changes to priority development project water quality control design criteria (found in Section E.3.C of the Tentative Order). Moreover, in one particular instance concerning which we and others have repeatedly commented to Regional Board staff, there is no technical justification provided by staff for requiring biofiltration LID BMP to be sized at 1.5 times the remaining design capture volume not reliably retained on-site. Section E.3.c.(3)(b)(i)[c] requires that if biofiltration is used as an alternative compliance method the biofiltration BMP is required to be sized to 1.5 times the design capture volume, which is an increase from the existing South Orange County permit. The permit and the fact sheet provide no technical justification for the 1.5 factor and therefore this requirement should be deleted from the permit. BIASC and CICWQ comment letter submitted to the Regional Board on September

14, 2012 and attachments including suggested permit redline remains relevant in this matter. We have provided this here as Attachment1.

2. There are no findings of fact or supporting technical and scientific data indicating the need for changes in hydromodification control requirements for priority development projects.

As we have commented before, there needs to be (i) an in-stream hydromodification control performance standard using the erosion potential (EP) approach; and (ii) the permit must recognize that there are a number of different types of channel hardening that have been used for armoring in stream systems besides concrete. In Attachment 1, we again make suggestions for improving the consistency of hydromodification control standards with those identified and allowed in the South Orange County MS4 permit.

The Tentative Order provides an "on-site" option for addressing hydromodification through flow duration control. This is an important element of the hydromodification control standard. However the Tentative Order is incomplete in that it lacks an option to assess and demonstrate hydromodification control through in-stream metrics. In many cases, significant development within a watershed has already caused hydromodification impacts. Requiring project-by-project flow duration control for each new project may not address the existing issue as effectively as a regionally-coordinated approach that combines upland control with in-stream remedies. Including the EP standard—as BIASC and CICWQ urge--would enable the development of more comprehensive approaches that include both upland controls and stream modifications (i.e., restoration). This option is critical for more effectively and efficiently protecting the region's aquatic resources.

Additionally, the Tentative Order includes an unnecessarily narrow definition of hardened channels that includes only those channels lined with concrete. Other forms of artificial hardening may be comparably resistant to hydromodification impacts, such as channels that are lined with rip rap, armored with soil cement, or armored with other practices. While the co-permittees or the project proponent should be responsible for demonstrating that a specific channel material is sufficiently stable, the narrow definition currently provided by the Tentative Order does not allow the use of sound engineering judgment and does not allow for use of innovative materials.

The comment letter submitted by BIASC and CICWQ to the Regional Board on September 14, 2012 remains relevant here, as the Regional Board staff did not make any changes to the hydromodification control requirements except for minor exemption allowances for using USGB council's LEED for redevelopment program standards. Exemptions, generally, are welcome and appropriate. But, in practice, referencing a voluntary, national green building and development certification program for use as part of a NPDES permit does not provide a viable pathway for most priority development projects that are located in already urbanized areas that are served by existing MS4 infrastructure. Exemptions identified in the adopted San Diego Hydromodification Management Plan are appropriate and should be cited and referenced in the Tentative Order, and any reference to USGB LEED standards deleted.

3. Preserve the 2010 adopted San Diego County Hydromodification Management Plan elements
