Re: DWR request for Contra Costa County-Solano County calculations

Dear Mr. Mizell:

During the California Department of Water Resources' (DWR) cross-examination of our expert witness, Dr. Richard Denton, on March 26, 2018, DWR requested that Contra Costa County and Solano County make available the spreadsheets of conversion calculations used to prepare the CCC-SC Exhibits for Part 2 of the California WaterFix Change Petition Hearing before the State Water Resources Control Board.

The requested spreadsheets are attached. They are the Excel spreadsheets used to calculate the conversion from specific electrical conductance (EC) to chloride concentration. The converted data in the attached spreadsheets were utilized in preparing CCC-SC 28 figures 1 through 5, and are referenced in Dr. Denton's written testimony, CCC-SC-3, at pages 29 through 33.

Dr. Denton utilized the following equations to make the attached calculations:

The calculation for converting from EC to chloride concentration in the vicinity of Old River at Bacon Island used the linear seawater intrusion equation in Exhibit DWR-509:

$$\text{EC to Cl } (\mu\text{S/cm to mg/L}) \quad \text{Cl} = 0.285 \text{ EC} - 50$$

When seawater intrusion is very small, agricultural drainage dominates in the central and south Delta (i.e., when EC is less than $280\mu\text{S/cm}$) and the chloride concentration is calculated using the agricultural drainage equation in DWR-509:

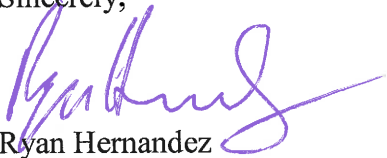

$$\text{EC to Cl } (\mu\text{S/cm to mg/L}) \quad \text{Cl} = 0.15 \text{ EC} - 12$$

According to Dr. Denton, the equations above were calibrated over the historical range of EC and chloride concentrations in the vicinity of Old River at Bacon Island and the Intake to the

Contra Costa Canal at Pumping Plant No. 1, so they only apply for EC less than 1,200 $\mu\text{S}/\text{cm}$, approximately. For larger EC, such as the 2,781 $\mu\text{S}/\text{cm}$ example given in CCC-SC-28 (Figure 5), a quadratic equation, such as the Mallard Island equation in DWR-509, is more appropriate and would normally be used. Using a linear equation underestimates the chloride concentration.

If you have any questions related to this response to your March 26, 2018 request, please contact Deputy County Counsel Kurtis Keller at (925) 335-1822.

Sincerely,

Ryan Hernandez
