

TRANSMITTAL LETTER

ΓO:	Ms. Colleen Hunt
	North Coast Water Quality Control
	Board

FROM: Elizabeth Cargay Town Of Windsor Public Works Department DATE: July 29, 2014

PROJECT: Stormwater NPDES Permit Plan SUBJECT: Revised Draft Non-Stormwater BMP Plan

The following are being transmitted:

1	Email including Comments from the NCRWQCB						
1	Revised Draft Non-Stormwater BMP Plan						
1	Sonoma County Water Based Fire Protection Systems Discharge BMP Manual and Cal Fire Water Based Fire Protection systems Discharge BMP Manual						

Comments:

Please find a copy of our Revised Non-Stormwater BMP Plan for the Town of Windsor incorporating your comments from your email dated May 29, 2015 to Paul Piazza. Also, as requested we are submitting a copy of the Sonoma CountyWater-Based Fire Protection Systems Discharge Best Management Practices Manual for your information. Please let us know if there are any additional comments to the plan.

I:\80 - Public Works\Environmental Programs\Storm Water Program\2009 Phase I MS4 NPDES\Part 10 III Conn and Disch Elim Pgrm\Non-Storm BMP Plan\Revised Draft Submittal to Water Board\Trans Let July 27 Revised NSWBMP Plan.docx

From: Hunt, Colleen@Waterboards [mailto:Colleen.Hunt@waterboards.ca.gov]

To: Paul Piazza
Subject: Town Of Windsor-Non Storm Water BMP Plan

Thank you for submitting the Town of Windsor's Non-Storm Water Discharge BMP Plan (BMP Plan). I have the following comments on the BMP Plan:

- The BMP Plan does not address BMPs for allowing the discharge of incidental runoff from potable landscape irrigation. Please clarify if the Town intentionally omitted this type of discharge or is it was an oversight? If the Town wants to allow the discharge of incidental runoff from potable landscape irrigation, please submit an addendum to the BMP plan with the types of BMPs which will be implemented to reduce the discharge of pollutants as a result of this specific discharge. Example BMPs include compliance with a water waste ordinance (if applicable), compliance with a water efficient landscape ordinance (if applicable), notification to property owner to address excessive run off, and enforcement on chronic or repeat discharges.
- The BMP Plan proposes to inspection recycled water sites annually to review for proper operation. The Regional Water Board request these sites be inspected at least quarterly.
- BMPs related to Emergency Firefighting Flow and Firefighting Training Flows refer to the BMPs in "Program for Firefighting and Fire System Flows." Please submit a copy of this document as an attachment to the BMP Plan.
- Please update the BMPs for Natural Springs and Rising Groundwater, Water from Crawl Space Pumps, and Gravity Flow from Foundation, Footing, and Crawl Space Drains to reflect that groundwater cannot be discharged to the MS4 if it known to be contaminated.
- The Town has the ability to use the BMP Plan in lieu of enrolling in the State Water Board's Drinking Water System General NPDES Permit, if the Town meets all applicable criteria. Part of that criteria is having the discharge of drinking water systems covered under the MS4 permit. This must be documented and implemented in the BMP Plan and consistent with the Drinking Water System Permit. The following items need to be addressed in the BMP Plan if the Town is intending to use the BMP plan in lieu of the Drinking Water Systems Permit.
 - Chlorine levels in discharges of superchlorinated water and within 300 feet of surface water shall not exceed 0.019 mg/L.
 - Please provide clarification on the term "off-river wells" (used on page 6).
 - The discharge of superchlorinated, well development and/or rehabilitation and individual discharges greater than 325,850 gallons will need to include monitoring consistent with the Drink Water Systems Permit, page E-3.
 - The plan needs to include a notification to the Regional Water Board for the planned discharge of 325,850 gallons or larger.

I suggest the City address these comments in an addendum to the BMP Plan. Please submit the addendum July 31, 2015. After the new permit is adopted, I will have each municipality submit a final plan, which will be subject to public notice and approval of the Regional Water Board Executive Officer.

Thank you,

Colleen Hunt

Introduction

This Town of Windsor (Town) Non-Storm Water Discharge Best Management Practices (BMP) Plan is being submitted as required by NPDES MS4 Permit Order No. R1-2009-0050. This BMP Plan sets forth approved protective measures for applicable allowable discharges in order to prevent or minimize the effects of non-storm water discharges to the Town's storm drain system. The BMPs for the categories of allowable Non-Storm Water Discharges when best management practices are implemented are listed and described below:

Allowable Non-Storm Water Discharges and BMPs

1. Stream Diversions

This category consists of diversions permitted by the State or North Coast Regional Water Quality Control Board (Regional Board) where such flows are intentionally diverted into the storm drain system.

Conditions under which allowed:

- a. All necessary permits, or authorizations, are received and all permit conditions are in place prior to diverting the flow.
- b. All work is completed in coordination with the appropriate resource agency, such as the Sonoma County Water Agency, California Department of Fish and Wildlife, the Regional Board, and the U.S. Army Corps of Engineers, or other applicable agencies, as necessary for the specific project.

Best Management Practices (BMPs) to be implemented:

- a. Control and/or minimize erosion, and discharge velocity to keep the diverted flows from discharging sediment to the storm drain system.
- b. Clean the affected storm drain prior to diversion to prevent discharge of sediment from the storm drain into local waterways.
- c. Follow the applicable resource agency permit requirements for protection of aquatic life.

2. Natural Springs and Rising Groundwater

This category consists of natural springs and rising ground water that are intentionally diverted into the storm drain system.

Conditions under which allowed:

- a. Permanent diversions that existed prior to the approval of this BMP Plan and are required to protect public infrastructure and public safety are exempt from this BMP plan.
- b. The diversion does not cause or contribute to exceedances of receiving water quality objectives.
- c. When there is no known contamination of water to be discharged.

Best Management Practices (BMPs) to be implemented:

- a. Segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas, if possible, or directly to the storm drain system, so as to avoid flowing across paved surfaces or gutters where pollutants may be present.
- b. Control the flow rate of the discharge to minimize erosion.
- c. Remove the sediment, when observed, from discharge through settling or filtration prior to release.
- d. Utilize BMPs, such as placement of sand bags, to prevent erosion and sediment transport.
- e. Collect and dispose of the sediment removed from discharge and dispose of in a timely and appropriate manner.
- f. Groundwater dewatering from construction or other pumped sources may require a separate NPDES permit. The Town will consult with the Regional Board staff for discharge requirements on a case by case basis.

3. Uncontaminated Groundwater Infiltration from Routine Town Infrastructure Maintenance

This category consists of low volume dewatering of uncontaminated ground water that has infiltrated [as defined by 40 CFR 35.2005(20)] Town utility structures and is diverted into the storm drain system. This also includes municipal vault dewatering¹. All private utility vault dewatering requires separate coverage under Order No. 2006-0008-DWQ, or as updated.

Conditions under which allowed:

- a. Feasible alternatives to discharge of non-storm water flow have been considered, and are not possible.
- b. Applies to low volume dewatering of Town-owned infrastructure only for routine maintenance and/or inspection purposes.
- c. There are no known sources of contamination in the infiltrated ground water.

¹ In Windsor, this would apply to water meter vaults.

Best Management Practices (BMPs) to be implemented:

- a. Evaluate water for odor, oil sheen or other indication of contamination to determine whether discharge to storm drain is allowed.
- b. Segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas if possible so as to avoid flowing across paved surfaces or gutters where pollutants are present.
- c. Remove sediment and debris, if present, from discharge through settling or filtration prior to release.
- d. Collect and dispose of the sediment and debris removed from discharge in a timely and appropriate manner.
- e. Control flow rate of discharge to minimize erosion potential.

4. Overflows/Diversions from Riparian Habitats or Wetlands

This category consists of overflows or diversions from riparian habitats² or wetlands where such flows are intentionally diverted into the storm drain system.

Conditions under which allowed:

- a. All necessary permits, or authorizations, are received and all permit conditions are in place prior to diverting the flow.
- b. All work is completed in coordination with the appropriate resource agency, such as the Sonoma County Water Agency, California Department Fish and Wildlife, the Regional Board, and the U.S. Army Corps of Engineers or other agencies, as required for the specific project.

- a. Segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas if possible or directly to storm drain system, so as to avoid flowing across paved surfaces or gutters where pollutants are present.
- b. Control and/or minimize the flow rate of the discharge to minimize erosion potential.
- c. Remove the sediment, when observed, from discharge through settling or filtration prior to release.
- d. Utilize BMPs, such as placement of sand bags, to prevent erosion and sediment transport.
- e. Collect and dispose of the sediment in a timely and appropriate manner.

² Riparian habitats refer to land area that encompasses a stream channel, its banks, and the land area adjacent to the stream containing vegetation unique to streams.

5. Emergency Firefighting Flow

Conditions under which allowed:

a. Feasible alternatives to discharge of non-storm water flow have been considered, and are not possible. Note that during a firefighting emergency, the safety of the public and the firefighting personnel are the priority.

Best Management Practices (BMPs) to be implemented:

a. Comply with the BMPs developed by the Sonoma County Fire Chief's Association and the City of Healdsburg Fire Department presented in the document titled "Program for Firefighting and Fire System Flows." These BMPs address firefighting, firefighting training activities, fire systems, and vehicle washing and repair.

6. Firefighting Training Flows

This category consists of flows from firefighting training activities, including live-fire training.

Conditions under which allowed:

a. Feasible alternatives to discharge of non-storm water flow have been considered including discharging to vegetated areas, and are not possible. Note that during live firefighting training, the safety of the public and the firefighting personnel are the priority.

Best Management Practices (BMPs) to be implemented:

a. Comply with the BMPs developed by the Sonoma County Fire Chief's Association and the City of Healdsburg Fire Department presented in the document titled "Program for Firefighting and Fire System Flows." These BMPs address firefighting, firefighting training activities, fire systems, and vehicle washing and repair.

7. Fire Hydrant Testing, Service and Repair

Conditions under which allowed:

a. Feasible alternatives to discharge of non-storm water flow have been considered, including discharging to vegetated areas, and are not possible.

- a. Dechlorinate the water at the onset of the maintenance activity.
- b. Segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas if possible so as to avoid flowing across paved surfaces or gutters where pollutants are present.
- c. Control flow rate of discharge to minimize erosion potential.

d. Utilize hoses and sand bags to prevent erosion and sediment transport.

8. Discharge from Potable Water Distribution Systems

This category consists of discharges from system maintenance activities such as water line and water lateral flushing.

Conditions under which allowed:

- a. Feasible alternatives to discharge have been considered, including discharging to land, and are not possible.
- b. Water main breaks and fire hydrant knockdowns are considered "spills" and require a California Office of Emergency Services (Cal OES) notification due to the high quantity of flow.

Best Management Practices (BMPs) to be implemented:

- a. Dechlorinate the water at the onset of the maintenance activity.
- b. Remove sediment and solids from discharge through settling or filtration.
- c. Segregate flow to prevent introduction of pollutants. Discharge flow to vegetated areas if possible so as to avoid flowing across paved surfaces or gutters where pollutants are present.
- d. Control flow rate of discharge to minimize erosion potential.
- e. Utilize BMPs, such as placement of sand bags, to prevent erosion and sediment transport.
- f. Collect and dispose of the sediment removed from discharge in a timely and appropriate manner.

9. Discharges from Drinking Water Supply Wells

This category consists of discharges from activities such as well flushing or pumping-to-waste; well development, rehabilitation, and testing; and groundwater monitoring for purpose of supply well development, rehabilitation and testing. This applies to wells owned and operated by the Town of Windsor.

Conditions under which allowed:

- a. Feasible alternatives to discharge of non-storm water flow have been considered, including discharging to vegetated areas, and are not possible.
- b. The diversion does not cause or contribute to exceedances of receiving water quality objectives.

- a. Dechlorinate the water at the onset of the maintenance activity.
- b. Prevent erosion by implementing flow dissipation and erosion control measures.

- c. Minimize sediment discharge turbidity and color impacts by implementing sediment and erosion control measures.
- d. Do not exceed receiving water limitation for turbidity and take action when the turbidity level is greater than 100 Nephelometric Turbidity Units (NTU) and continue actions until turbidity is less than 100 NTUs.
- e. For wells not adjacent to the Russian River, and therefore not under the direct influence of surface water, monitor the temperature, pH, and stay within the range of receiving water quality objectives in the Basin Plan.
- f. Chlorine levels in discharges of superchlorinated water and within 300 feet of surface water shall not exceed 0.019 mg/L.
- g. The discharge of superchlorinated water, water from well development and/or well rehabilitation and individual discharges greater than 325,850 gallons will to include monitoring consistent with page E-3 of the Drink Water Systems Permit.
- h. The Town will notify the North Coast Regional Water Quality Control Board of discharges of 325,850 gallons or greater.
- i. Properly train responsible Town personnel to implement required BMPs.

10. Gravity Flow from Foundation, Footing and Crawl Space Drains

Conditions under which allowed:

- a. Feasible alternatives to discharge of have been considered and are not possible.
- b. Discharges that exist prior to the approval of this BMP Plan are exempt, unless they pose a measurable threat to water quality in which case the Town reserves the right to require BMPs to protect water quality.
- c. When there is no known contamination of water to be discharged.

Best Management Practices (BMPs) to be implemented:

- a. Remove sediment and solids from discharge through settling or filtration.
- b. If possible, segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas if possible so as to avoid flowing across paved surfaces or gutters where pollutants are present.
- c. Utilize BMPs, such as sand bags, to prevent erosion and sediment transport.
- d. Collect and dispose of the sediment removed from discharge in a timely and appropriate manner.

11. Residential Air Conditioning Condensate

This category consists of discharges from residential or other small air conditioning units with incidental quantities of condensate. Large air conditioning units, such as used in commercial or industrial settings, are required to divert condensate to the sewer system. Discharge to the storm drain system from these large systems is prohibited.

Conditions under which allowed:

a. Feasible alternatives to discharge have been considered and are not possible.

Best Management Practices (BMPs) to be implemented:

a. If possible, segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas if possible so as to avoid flowing across paved surfaces or gutters where pollutants are present.

12. Water from Crawl Space Pumps

Conditions under which allowed:

- a. Discharges that exist prior to the approval of this BMP Plan are exempt, unless they pose a measurable threat to water quality in which case the Town reserves the right to require BMPs to protect water quality.
- b. Feasible alternatives to discharge have been considered, including discharging to vegetated areas, and are not possible.
- c. When there is no known contamination of water to be discharged.

Best Management Practices (BMPs) to be implemented:

- a. If possible, segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas if possible so as to avoid flowing across paved surfaces or gutters where pollutants are present.
- b. Remove sediment and solids from discharge through settling or filtration.
- c. Utilize BMPs, such as sand bags, to prevent erosion and sediment transport.
- d. Collect and dispose of the sediment removed from discharge in a timely and appropriate manner.

13. Incidental Runoff of Potable Water from Urban Landscape Irrigation

Conditions under which allowed:

a. Runoff must be in small, incidental quantities, caused by minor over-spray or temporary leaks.

- a. Comply with the Town's Water Waste Ordinance, which prohibits runoff in significant quantities and requires repair of breaks or leaks in the irrigation system within 72 hours.
- b. Comply with the Town's Water Efficient Landscape Ordinance (WELO) which has landscape planting and irrigation criteria for all new landscape installations. The purpose of the WELO is to maximize water use efficiency and retain irrigation water on the landscape site.

14. Incidental Runoff of Recycled Water from Urban Landscape Irrigation

Conditions under which allowed:

a. Runoff must be in small, incidental quantities, caused by minor over-spray or temporary leaks.

Best Management Practices (BMPs) to be implemented:

- a. Comply with the Town's Water Waste Ordinance, which prohibits runoff and breaks or leaks in the delivery system for all landscape irrigation, whether from potable or recycled water.
- b. Comply with the Town's Water Efficient Landscape Ordinance (WELO) which has landscape planting and irrigation criteria for all new landscape installations, whether irrigated by potable or recycled water. The purpose of the WELO is to maximize water use efficiency and retain irrigation water on the landscape site.
- c. Handle all recycled water as prescribed in the Town's "Recycled Water User's Guide" dated August 2012 and all subsequent revisions and clarifications.
- d. Maintain a recycled water user permit, issued by the Town, and designate a site supervisor. Manage sites according to the Town of Windsor's Ordinance No. 2003-166, titled *Recycled Water Service Connection*.
- e. Town staff will inspect all recycled water sites at least quarterly to review for proper operation. It is understood that residential developments served by recycled water are considered to be one site made up of several homes.
- f. Town staff will notify the Regional Board if the discharge reaches the storm drain system or a waterway for discharges greater than 1,000 gallons. When this occurs, the site is shut down by the Town and the customer is educated and the issue corrected prior to reestablishing service.

15. Recycled water runoff from agricultural sites

Conditions under which allowed:

a. Recycled water users for agricultural sites must have an appropriate permit from the Town.

- a. All recycled water sites must have a permit issued by the Town and must designate a site supervisor, who will act as the liaison with the Town to implement all recycled water requirements.
- b. All permits issued by the Town list minimum BMPs that must be followed to protect water quality.
- c. All new agricultural recycled water accounts are required to comply with the Town's "Agricultural Recycled Water User Agreement" and all subsequent revisions and clarifications.

- d. All sites are evaluated prior to connection to evaluate suitability for recycled water use.
- e. All sites using recycled water are inspected at least once per year and at random by Town staff to evaluate proper operation.
- f. All inspections are documented.
- g. Town staff will notify the Regional Board if the discharge reaches the storm drain system or a waterway for discharges greater than 1,000 gallons. When this occurs, the site is shut down by the Town and the customer is educated and the issue corrected prior to reestablishing service.

16. Dechlorinated / Debrominated Swimming Pool Water

This category consists of discharge of swimming pool water, only when water has been dechlorinated or debrominated and is within normal pH range. Discharge of chlorinated or brominated swimming pool water is prohibited.

Conditions under which allowed:

a. Feasible alternatives to discharge of non-storm water flow to the storm drain system have been considered, including discharge to vegetated areas, and are not possible.

Best Management Practices (BMPs) to be implemented:

- a. Water is pH adjusted to between 6.5 and 8.5, and dechlorinated using aeration and/or other appropriate means including infiltration into the ground so that the chlorine residual in discharge does not exceed 0.019mg/L.
- b. Utilize BMPs to increase the distance and removal of chlorine by volatilization before discharge to a storm drain.
- c. Segregate flow to prevent introduction of pollutants. Flow should be discharged to vegetated areas if possible so as to avoid flowing across paved surfaces or gutters where pollutants are present.
- d. Control flow rate of discharge to minimize erosion potential.
- e. Utilize hoses and sand bags to prevent erosion and sediment transport.

17. Non-Commercial Car Washing

This category consists of non-commercial car washing of private vehicles by residents (washing their own vehicles at a residential dwelling) or non-profit or community organizations.

Conditions under which allowed:

a. Feasible alternatives to discharge of non-storm water flow have been considered and are not possible.

Best Management Practices (BMPs) to be implemented:

a. Encourage car washing at commercial carwashes or in an area where wash water infiltrates, such as vegetated areas.

- b. Encourage non-profit organizations conducting fundraising car washes to use pumps, vacuums or physical routing BMPs to direct water to vegetated areas for infiltration.
- c. Encourage practices to minimize runoff, such as using a bucket and sponge.
- d. Use a hose nozzle with automatic shut-off valve.

18. Maintenance Activities from Storm Water Treatment BMP Features, such as Vortex boxes, Filterra Tree Wells, etc.

This category consists of pooled storm water from treatment BMP features that are intentionally discharged to the storm drain system as part of the features' maintenance activities.

Conditions under which allowed:

- a. The storm water treatment facility is maintained according to manufacturer guidelines.
- b. Feasible alternatives to discharge of non-storm water flow have been considered, including discharge to vegetated areas, and are not possible.
- c. The discharge is not a source of pollutants.

Best Management Practices (BMPs) to be implemented:

- a. Maintain all storm water BMP features at a frequency specified by the manufacturer.
- b. Collect and dispose of the sediment removed from discharge in a timely and appropriate manner.

19. Municipal Water Tank Maintenance

Conditions under which allowed:

a. Feasible alternatives to discharge of non-storm water flow have been considered, including discharge to vegetated areas, and are not possible.

Best Management Practices (BMPs) to be implemented:

- a. Minimize the quantity of water in tank prior to maintenance activity.
- b. Dechlorinate the water remaining in the tank at the onset of the maintenance activity.
- c. After the dechlorination is complete, discharge the water slowly to storm drain system, while implementing measures to eliminate or minimize erosion.
- d. Vacuum out the final residual silt remaining in the bottom of the water tank into a haul truck and properly dispose.

20. Surface Cleaning of Sidewalks and Other Impermeable Surfaces

Conditions under which allowed:

- a. Feasible alternatives to discharge of non-storm water flow have been considered, including discharging to vegetated areas, and are not possible.
- b. No soap or cleaning agent is used.

- c. Only small amounts of oil are present on the area being cleaned.
- d. Only non-heated water is used.

Best Management Practices (BMPs) to be implemented:

- a. Sweep, collect and dispose of debris.
- b. Clean all oil spots, if present, with water free methods prior to power-washing.
- c. Properly dispose of all absorbent material.
- d. Place oil-absorbent boom around storm drain inlet during power-washing if oil spots are present.
- e. Protect the storm drain inlet with filter material to remove pollutants, if pollutants are known or observed to be present.

21. Surface Cleaning of Building Exteriors, Rooftops and Walls

This category consists of wash water from cleaning building exteriors, rooftops and walls of buildings.

Conditions under which allowed:

- a. Feasible alternatives to discharge of non-storm water flow have been considered, including discharging to vegetated areas, and are not possible.
- b. No soap or cleaning agent is used.
- c. The building is known to be painted with lead-free paint.

Best Management Practices (BMPs) to be implemented:

- a. Sweep, collect and dispose of debris that could be washed into the storm drain system.
- b. Protect the storm drain inlet with filter material to remove pollutants and paint chips.

This BMP Plan is intended to be consistent with the Basin Plan Amendment. Any revisions to the Basin Plan Amendment prior to adoption may result in the subsequent revision of this BMP Plan. Any nonstorm water discharge not specifically listed in this BMP Plan will be governed by the Basin Plan and the Basin Plan Amendment.

Toni Bertolero Public Works Director/Town Engineer Town of Windsor

PROGRAM FOR FIRE FIGHTING AND FIRE SYSTEM FLOWS

Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited. However, as part of the MS4 Storm Water Permit update, the Sonoma County Fire Chief's Association (SCFCA) is developing a program to reduce pollutants from nonemergency fire fighting flows, fire system testing and maintenance, vehicle and equipment maintenance as well as for emergency discharges (as time and resources allow).

BEST MANAGEMENT PRACTICES

In consideration of BMPs associated with non-emergency fire fighting activities, the SCFCA has identified a number of potential discharge sources including maintenance of fire and emergency vehicles and equipment, training exercises, fire systems and facility maintenance. It is important to recognize, and make provision for the post emergency rehabilitation of response equipment including tools, fire hoses, ladders, and other equipment utilized at the scene of an emergency, as this equipment must be restored to a response-ready state in a manner that does not delay the ability of the apparatus to be available for subsequent response actions. As such, the use of water that could contribute to storm water discharges may be used unless another practical and immediately available method is identified, and will be performed in a manner that minimizes discharges to the storm drain. In consideration of the non-emergency activities listed above. The SCFCA has identified the following BMPs to address discharge generated from such activities:

NON-STORM WATER DISCHARGES

- EMERGENCY DISCHARGE FIREFIGHTING, UNAUTHORIZED HYDRANT OPENINGS, NATURAL OR MAN-MADE DISASTERS (E.G. EARTHQUAKES, FLOODS, WILDFIRES, ACCIDENTS, TERRORIST ACTIONS)
 - If time and resources allow, plug the storm drain collection system for temporary storage and proper disposal of runoff
 - If time and resources allow, dam, dyke or berm runoff from fires at industrial facilities or where hazardous materials are involved in the firefighting activities. Request Hazardous Materials Response Teams if necessary for mitigation, monitoring, damming, dyking, and testing equipment
 - Report any hazardous materials entering the storm drain system by getting a CalEMA # (OES#) 800-852-7550. Proper agencies will be notified
 - When putting equipment back into service do not drain any foam in an area that may enter the storm drain, direct foam to landscaped areas or graveled or green areas whenever possible and safe to do so without causing damage or erosion

- ➢ FIRE TRAINING
 - Whenever possible, practice drills are to be performed in areas where runoff will be contained
 - When practice drills must be performed in an area where runoff could potentially leave the site, the site shall be surveyed by the officer-in-charge prior to training activities to ensure that debris will not enter the storm drain system as a result of the drill
 - As determined feasible, runoff from training drills or other non-emergency activities, will be directed to landscaped areas, graveled or green areas whenever possible and safe to do so without causing damage or erosion
 - Areas that have debris that could potentially enter the storm drain system as a result of the drill activities will not be used for training until the debris has been removed
 - Runoff from fire training activities will be dechlorinated by containment, aeration, volatilization, or with dechlorination tablets used by trained personnel before discharge to the storm drain system
- ► LIVE FIRE TRAINING
 - Live fire training activities will be pre-planned to allow integration of structural BMP barriers to control runoff as deemed necessary
 - Runoff from live fire training activities will be dechlorinated by containment, aeration, volatilization, or with dechlorination tablets used by trained personnel before discharge to the storm drain system
- ➢ FIRE SYSTEMS
 - Contain flows onsite and/or direct the water flows to landscaped or green areas whenever possible and safe to do so without causing damage or erosion
 - Divert sprinkler system flows to the sewer, when practicable and with the permission of the local sewer agency
 - Runoff from fire system testing and maintenance activities will be dechlorinated by containment, aeration, volatilization, or with dechlorination tablets used by trained personnel before discharge to the storm drain system
 - Discharge from dry chemical suppression systems must be disposed of properly
- ► VEHICLE WASHING & REPAIR
 - Wash vehicles at a specifically designated wash area that drains to the sanitary sewer or take vehicles to a commercial, city or county wash rack.
 - If a wash rack connected to a sanitary sewer system is not available, runoff from vehicle and equipment washing activities shall be directed onto landscaped, graveled or green areas whenever possible and safe to do so without causing damage or erosion
 - Perform maintenance or repair work inside. Only emergency repairs and maintenance activities that do not involve fluids may be performed outdoors
 - Do not store leaking vehicles or equipment outdoors. Contain leak (drip pans), repair immediately or move indoors and repair
 - Good housekeeping and dry cleanup practices will be utilized as part of standard facility maintenance
 procedures
- EDUCATION OF PERSONNEL
 - Train employees on these BMPs, storm water discharge prohibitions, and wastewater discharge requirements
 - Establish a regular training schedule, train all new employees, and conduct annual refresher training
 - Use a training log or similar method to document training

WATER-BASED FIRE PROTECTION SYSTEMS DISCHARGE BEST MANAGEMENT PRACTICES MANUAL

California State Fire Marshal

In cooperation with Division of Water Quality Storm Water Section

September 2011

Message from the Acting State Fire Marshal

On behalf of CAL FIRE – Office of the State Fire Marshal (OSFM) I am pleased to present the **Water-Based Fire Protection Systems Discharge Best Management Practices Manual**. The extensive discussions, analysis, and expertise resulting in these recommendations and best management practices (BMP) are essential to a balanced and appropriate approach for the proper processing of water discharged from a fire protection system. The testing and flushing of these life safety systems are important to the continued efforts to protect the citizens of California. The Task Force hopes that these BMP will be embraced at both regional and local levels providing a consistent application.

The OSFM would like to extend a sincere gratitude to Co-Chairs: James Parsegian; Deputy State Fire Marshal III, Fire Engineering Division, James Carver, Fire Marshal, El Segundo Fire Department, and Bruce Lecair, West Coast Regional Manager, National Fire Sprinkler Association and to each of the members and organizations for their dedication and commitment to this important project. We appreciate the participants' willingness to share their time, energy, and talent; particularly during these very busy and difficult fiscal times. Through our partnerships we will continue to move fire and panic safety initiatives forward, providing a safer working environment for emergency responders and a safer environment for all those who live in and/or visit the State of California.

Sincerely,

TOŃYA L.⁹HOOVER Acting State Fire Marshal

Acknowledgements

This Best Management Practices Manual was developed through the accumulation of research, analysis, and collaborative efforts of the many disciplines involved with the State Fire Marshal Water Discharge for Fire Protection Task Force.

Included in those efforts are (in alphabetical order) the: Allan Automatic Sprinkler Corporation of Southern California, California State Water Resources Control Board, City of Beverly Hills Waste Water Treatment Program, City of El Segundo Fire Department, City of Healdsburg Fire Department, City of Torrance Fire Department, East Bay Municipal Utilities District, National Automatic Sprinkler Industry Promotion, National Fire Sprinkler Association, Northern California Fire Prevention Officers Association, Paraclete Fire Safety Incorporated, Riverside County Fire Permit Department, Sonoma County and Resource Management Department, and Southern California Fire Prevention Officers Association.

Executive Summary

In response to a request by the National Fire Sprinkler Association, the State Fire Marshal convened a Water Discharge for Fire Protection Task Force under the State Fire Marshal Automatic Extinguishing Systems Advisory Committee to review and develop a guideline for the discharging water from fire protection systems. The task force was established with representatives from various agencies and organizations which included both government and industry. The purpose of the Task Force was to develop a set of Best Management Practices for Contractors State License Board licensed contractors, State Fire Marshal licensed companies and the fire service; to discharge water from a fire protection systems and to provide guidance regarding the practices to control possible contamination of California waters when maintaining fire suppression systems.

Overview

This manual is intended to give persons discharging water (Discharger) from a water-based fire protection system and the municipal separate storm sewer system (MS4) operators a common set of best management practices (BMP) for the proper processing of water discharged from a fire protection system.

The types of discharge covered in this manual are associated with:

- Water-based fire protection system acceptance testing.
- Periodic water-based fire protection system testing and maintenance.
- Fire hydrant testing.
- Water-based fire protection system leaks and emergency repairs.

Purpose and Scope

The purpose of this document is to provide a set of BMP to affected parties in the State of California with a range of procedures for mitigating the discharge of water from a fire protection system to municipal storm sewer systems in a manner consistent with the protection of life property and the environment. It is not to provide a day-to-day field manual for dischargers but rather a set of options (tools) from which dischargers and local agencies may select and customize for their particular needs and settings. Dischargers are encouraged to contact the operator of the receiving MS4 system to discuss any specific discharge requirements.

Part 1: Participants

- 1. Fire Departments are responsible for protecting life and property from fire. Fire Departments periodically discharge water into the MS4. While emergency fire flows are exempted from permitting, non-emergency discharges may be regulated in some regions.
- 2. MS4 are built, maintained, and/or operated by a wide range of agencies such as municipalities, counties, flood control districts, and road/transportation departments. They must abide by and enforce the Clean Water Act, the Porter-Cologne Act, and the Storm Water Rule. Most Regional Water Quality Control Boards (RWQCB) and the U.S. Environmental Protection Agency (EPA) issue MS4 permits; most MS4 operators must have an MS4 permit. MS4 permits require agencies to legally ban and prevent all illicit discharges of non-storm water from entering their MS4. Water collected by MS4 is ultimately discharged into the waters of California.
- 3. The State Water Resources Control Board (SWRCB) and the various RWQCB are charged with the protection of the waters of California and enforcement of the Clean Water Act, the Porter-Cologne Act, and the Storm Water Rule. This is accomplished by the issuance and enforcement of National Pollution Discharge Elimination System (NPDES)/Waste Discharge Requirements (WDR) permits, including MS4 permits for most MS4 operators and in some cases WDR for Community Water Systems (CWS) discharging into MS4.
- 4. Dischargers include California State Fire Marshal (CSFM) SFM A license Concern, as well as Contractors State Licensing Board (CSLB) Type A, C-16, C-34, and C-36 licensees who perform testing and maintenance of water-based fire protection systems as required by the California Fire Code. Carrying out these activities requires periodic and prescribed discharges into MS4. The activity and concerns/contactors approved for those activities are as follows.
 - a. For water-based fire protection acceptance testing:
 - Underground Type A, C-16, C-34 and C-36 only
 - Above Ground C-16 only
 - Water Flow C-10 (limited to water flow only)
 - b. For periodic water-based fire protection system testing and maintenance:
 - Underground C-16 only
 - Above Ground C-16 only
 - Water Flow C-10 (limited to water flow only)

- SFM A license Concern (Limited to testing and maintenance)
- c. For fire hydrant testing:
 - Underground Type A, C-16, C-34 and C-36 only
 - Above Ground C-16 only
 - SFM A license Concern (Limited to testing and maintenance)
- d. For water-based fire protection system leaks and emergency repairs:
 - Underground Type A, C-16, C-34 and C-36 only
 - Above Ground C-16 only
 - Water Flow C-10 (limited to water flow only)
 - SFM A license Concern (Limited to testing and maintenance)

Note: Fire Departments may conduct testing of any water based fire protection system.

Part 2: Notification and Record Keeping

This document covers discharges to the municipal storm sewer system, not the sanitary sewer system. If it becomes necessary to discharge to the sanitary sewer system, written permission or a permit is typically required from the local sanitary sewer authority. When using this manual, a discharge is water which comes from a single location and project. If a Discharger releases water from a given location and a given project in a series of related events, these events are considered one discharge.

- 1. Notification and Recordkeeping
 - a. A single discharge of less than 1,500 gallons Discharger does not need to give prior notification.
 - b. A single discharge equal to or greater than 1,500 gallons but less than 10,000 gallons – Discharger does not need to give prior notification for any single discharge, but would need to maintain records of those discharges.
 - c. A single discharge equal to or greater than 10,000 gallons Discharger does need to give prior notification and maintain records of the discharge.
- 2. Prior Notification

Dischargers should notify the MS4 agency/operator not less than 24 hours prior to any planned discharge and as soon as possible after any emergency discharge. The method of notification must be by one of the four options listed below:

- a. Telephone call
- b. A fax transmission
- c. An email
- d. In person

Note: The large majority of single discharge events from existing building waterbased fire protection systems are drain and fill tests which are small in volume falling at or below 1500 gallons based on building and system size. Reporting and recordkeeping (though the latter is often done as a matter of practice by licensed Dischargers) would yield a significant additional administrative and cost burden on all parties.

3. Recordkeeping

Records should be kept utilizing the sample form provided in **Appendix C** of this manual. The sample form should be completed in either black or blue ink. Records of discharges should be retained for a minimum of five years. Records must be made available for review by the MS4 and/or RWQCB and must provide the following information:

- a. Information for all discharges greater than 1,500 gallons
- b. Name of Discharger
- c. Date of notification (if equal to or greater than 10,000 gallons) or emergency
- d. Method of notification (if equal to or greater than 10,000 gallons) or emergency
- e. Location of discharge
- f. Date of the discharge
- g. Time of the beginning and end of the discharge
- h. Duration of the discharge (minutes)
- i. Flow rate (gallons per minute)
- j. Total number of gallons discharged
- k. Type of dechlorination "chemicals" used
- I. Concentration of chlorine measured after dechlorination including time of sampling and description of sampling location
- m. Type of sediment controls used

Note: When exact flows, volumes, and length of discharge are not available the discharger needs to estimate the values.

FIRE SPRINKLER WATER DISCHARGE SUMMARY

			Sediment and Debris Control			
Event Total Gallons	Notification MS4	De-Chlorination	Within Piping System	Exterior Surface	Chemical Testing	Record Keeping
≤ 1,500	Not Required	Not Required	Not Required	**	***	Not Required
> 1,500 ≤ 10,000	Not Required	*	**	**	***	Required
> 10,000	Required	*	**	**	***	Required

Required if discharge is to enter storm drain system and water is fresh.

Required if debris exists and together with discharge will enter storm drain system

*** Required if it has been determined that chemical additives are within piping system.

Part 3: Flow and Volume Determination

Dischargers need to determine the flow and volume of the discharge.

- 1. Flow is determined by one of the following methods:
 - a. Attaching a flow meter to the discharge opening and reading the displayed value
 - b. Measuring the pressure from a pressure gauge and then using the table or formulas found at the end of **Appendix B**
 - c. Where "a" or "b" are not applicable, measure the velocity (V) using a floating object and measure or calculate the cross-sectional area (A) of flowing water. (V x A = flow rate [e.g., V = 2 ft/sec and A = 1.5 ft²; Flow = 3 ft³/sec or 1,347 gal/min])
- 2. Volume is determined by multiplying the flow (e.g., gallons/minute) by the duration of the discharge (minutes).

Part 4: Safety Considerations

Dischargers need to take the following precautions before flow testing a hydrant:

1. Ensure water will flow into nearby drain inlets as intended.

- 2. Ensure drain inlets are open and free of debris.
- 3. Ensure flowing water will not cause flooding or damage to adjacent properties.
- 4. Ensure water flow trajectory will not impact nearby vehicles, equipment, or pedestrian traffic.
- 5. Ensure water flow does not create slick or unsafe conditions.

Note: Do not conduct the test if any unsafe condition exists or would be created. If in doubt, do not conduct the test and notify the building owner and MS4 operator if prior notification was made.

Part 5: Discharge into Sensitive Areas

Sensitive areas are those that may present a potential problem or hazard to the environment. Use best judgment in analyzing each area. Address the following concerns when evaluating whether to test the hydrant.

- 1. Ensure road surfaces are free of debris that may flow into the drain inlets or nearby sensitive areas.
- 2. Ensure curbs or ditches are adequate to handle the flow without creating a buildup of silt which cannot be contained and removed.
- 3. Ensure water flows will be free of potential contaminants such as oil, contaminated soils, etc.
- 4. Ensure water does not cause erosion.

Note: Do not test the hydrant if any of the above or any other condition may adversely impact the area. If in doubt, do not test and notify the building owner and MS4 if prior notification was made. If a problem does arise, such as a major erosion or siltation of nearby creeks, discontinue testing and notify the MS4 immediately.

Part 6: Water Discharge Mitigation

- 1. Conduct flows for the shortest duration possible. MS4 may limit maximum flow rate to storm sewer.
- 2. Remove all debris from the curb and gutter before initiating flushing.

- 3. If chlorine residual is a concern, use dechlorination. Many, if not most, testing and maintenance discharges will not have chlorine residual due to the age of the water in the system. If CWS water is introduced during testing and then discharged, it will require dechlorination.
- 4. Whenever possible and when safe to do so without causing damage or erosion, contain flows onsite by directing the water to landscaped or green areas.
- 5. When practicable and with the permission of the local sewer agency, divert sprinkler system discharge to the sewer. The local sewer agency may have additional conditions.
- 6. Assess the following prior to any partial or full discharge of water from a vault, substructure or building fire system into the street or storm drain system.
 - a. Ensure the water is not cloudy, discolored and/or has no unusual odor.
 - b. Ensure the Fire Protection System water does not have chemical additives. If it has been determined that chemicals have been added to the fire protection system the following actions must be taken:

Note: The following conditions may require testing by an accredited laboratory for cloudiness, discoloration and odors (sewage, chemicals, solvents, gasoline, etc.). Turbid water due to rust and musty stagnation would be subject to BMP for containment and sediment control.

- i. The water should be tested by an approved testing facility to determine the chemical and the proper treatment.
- ii. Upon completion of the chemical report of the water test, the results should be submitted to the MS4 regulator to determine the approved discharge method and location of the water discharge. Examples of the discharge location may be storm drains, sewage system or to an approved treatment facility or plant.
- iii. If chemicals are to be reintroduced into a system, proper signage should be provided for guidance.
- Dechlorination The MS4 General NPDES Permit requires all waters discharged must be dechlorinated before entering a storm drain. Failure to follow this procedure could result in death of aquatic animals and legal liability. Methods of dechlorinization include using aeration

and/or other appropriate means such as infiltration to the ground, bags, diffusers, and at sediment traps in drop inlets where controllable.

Dechlorination Equipment

- a. Bags Consisting of a mesh bag into which large tablets of dry chemical are placed to react with residual chlorine to remove it from the water
- b. Flow Meter (optional)
- c. Pressure Gauge
- d. Pitot Tube
- e. Dechlorination chemicals
 - i. Sodium Sulfite
 - ii. Sodium Bisulfate
 - iii. Sodium Thiosulfate
 - iv. Ascorbic Acid
- f. Diffusers Mechanical devices which are placed on the end of the discharge point which automatically mixes the discharged water with either dry or wet dechlorination chemicals. A wide variety of diffusers are available.
- g. Chlorine Residual Test Kits
 - i. Test Strips Are dipped into the water; the color of the strip changes depending on the concentration of the chlorine. A comparator on the package allows for the determination of the chlorine concentration.
 - ii. Color Wheels A square clear plastic container that holds about 10 milliliters of water. Chemicals are added to produce a pink color. A wheel attached to the plastic container has different shades of pink which correspond to different concentrations of chlorine. The wheel can be turned so that the shade of pink of the water sample can be matched to the corresponding chlorine concentration.
 - iii. Electronic Colorimeters Devices consisting of a glass or plastic cell and a hand-held electronic colorimeter. A sample of water is placed in the cell and chemicals are added which produce a pink color. A second cell has a water sample with no chemicals added. The cell with no chemicals is placed into the colorimeter and the device measures the intensity of color. This is then assigned a value of zero. The cell that had chemicals added is then placed in the colorimeter and the device measures the intensity of the color and then converts that intensity into a concentration of chlorine or chloramines on a display.

Note: Chlorine Residual Test Kits–In order to determine if the dechlorination process removes the disinfectant, it is necessary to test the water.

- 8. Sediment Control The MS4 General NPDES Permit requires all Dischargers to minimize sediments and other debris entering a storm drain. Failure to follow this procedure could result in adverse impacts to aquatic animals, obstruction of flood control facilities, flooding, and legal liability.
 - a. There are a wide variety of equipment that may be used for sediment control and clean-up depending upon the requirements of the specific site where discharges might occur (see Appendix D for pictures of examples).
 - i. Wattles
 - ii. Sand Bags
 - iii. Gravel bags
 - iv. Mats
 - v. Booms
 - vi. Barricades
 - vii. Silt Fencing
 - viii. Hay Bales
 - ix. Hoses
 - x. Filters
 - xi. Debris Storage
 - xii. Brooms
 - xiii. Shovels
 - xiv. Rakes
 - xv. Vacuum Truck or Wet/Dry Vacuum
 - b. Procedure As an example place gravel or sand filled bags to form dams across (perpendicular to) the flow path and curb with the end of the dam (furthest from curb) curving slightly upstream. Dam height, length, the number of bags used and the interval between dams will vary depending upon site conditions and the resources available. It is recognized that there will be some circumstances where steep topography and/or high flow rates will preclude effective sediment removal using any of the current technologies. The following criteria should be used to determine bag placement:
 - i. Dam Height The height of each dam should be slightly less than the height of the curb or other retaining structure that is acting to channel the flow. If it is equal to or higher than the curb, flow will be diverted onto the sidewalk and cause flooding.

- ii. Dam Length The longer the dam, the greater the ponding area and the better the retention, which allows the sediment to drop out. However, dam length is limited by the number of bags available, traffic flow considerations and potential for flooding of property, bags and ponded water should not extend outside of coned areas into traffic lanes or onto private property.
- iii. Number of Dams and Distance between Dams In general, the greater the number of dam locations between the discharge source and entry into storm drains or receiving waters, the greater the retention of sediment. A minimum of two dams should be used in all cases. The interval between dams must shorten as the ground surface gradient (slope) increases to maintain equivalent sediment removal rates.
- iv. When the discharge is complete, allow any water that is ponded behind the dams to be drained. Be sure storm drain inlet is protected. Shovel up as much sediment as possible. Move one of the dams to a location immediately upstream of the storm drain or to the point where the flow enters receiving waters to provide sediment control for discharge cleanup. If possible, clean the flow path and upstream dams to remove residual sediment from the street. Retrieve all dam materials and store in appropriate location.
- 9. Determine Flow Path

Determine the flow path of the discharge from the point of release to the inlet of a storm drain.

- a. Procedures: Evaluate and determine the appropriate BMP to use.
 - i. Isolate the riser or control valve prior to draining
 - ii. Evaluate the release volume and character. Compare with the release point and conveyance
- b. Inspect the flow path to ensure the flow path is clear and unobstructed allowing water to flow to the storm drain. Consider the following:
 - i. The maximum flow rate that will not cause erosion or scouring of any exposed ground in the flow path
 - ii. The flow path must offer adequate capacity to allow the flow to move quickly to the storm drain without undesirable flooding or pooling. There must be nothing in the path that would interfere with the dechlorination process or hinder the analysis of the chlorine level. Whether the flow path is paved or unpaved, permeable or

impermeable, the flow must not inappropriately scour the surface. The discharge must not damage either pavement or neighboring property or impact vehicle or pedestrian traffic

iii. Permeable and natural surfaces are much more subject to scouring and erosion and thus cannot support higher velocities and require more robust sediment control equipment.

If there are large areas of permeable or natural surfaces where scouring and mobilization of sediments are possible, hoses may be used to move the discharge point away from these areas to an area better able to support the anticipated flow or temporary mats or channels may be installed to protect the area

- c. Alignment of the discharge point can have important implications. Whether the discharge point is a diffuser or a hose or a pipe, it must be placed in such a way that it does not undercut pavement or erode soils. The force with which the water is hitting the surface should be minimized by adjusting the flow.
 - i. Record the time of the beginning of the discharge.
 - ii. Begin the flow slowly, increasing flow gradually so as not to damage any equipment or property.
 - iii. Inspect the discharge path as the flow increases. Make sure that no scouring, erosion, or undercutting of pavement is occurring. If concerns arise immediately take corrective action which could include:
 - 1. Reduce the flow rate of the discharge.
 - 2. Adjust the angle of the discharge.
 - 3. Stop discharge altogether.
- d. Prepare the flow path for discharge. Remove materials that may obstruct or divert discharge flow from the discharge point to the entrance. Also remove any materials that may interfere with the dechlorination process or clog the sediment control equipment.
 - i. Place the dechlorination and sediment control equipment between the point of release and the entry to the storm drain. Impermeable and engineered surfaces can generally support higher velocities and require less robust sediment control equipment or angle of the discharge.
 - ii. Add the dechlorination chemical to the equipment.
 - Measure the chlorine concentration at a point prior to the inlet to the storm drain. If chlorine residual is present, take steps to reduce this concentration, including but not limited to:
 - 1. Make adjustments to the dechlorination equipment

to increase the amount of chemical being added.

- 2. Reduce the flow of the discharge.
- 3. Add more chemical to the storage vessel.
- 4. Reduce flow slowly and remove equipment.
- 5. When the discharge is complete, record the time and determine the volume discharged.
- 6. Clean up all debris and sediments in the flow path and trapped by the control equipment.
- Drain Inlet Protection Drain Inlet Filter Bag Before the drain event, check to be sure the fire protection system discharge does not interfere with or delay repairs or corrective actions undertaken by the MS4 agency.
 - a. Procedure: Evaluate and determine appropriate BMP to use. Place bags to either completely or partially surround drain inlet. The number of bags used will vary depending upon site conditions and the resources available. Protection should be installed around all affected drain inlets within reason. Several bags may need to be stacked on top of each other to produce the desired protection. Remove grate from drain inlet and ensure that it is clear and clean of debris. Place filter bag insert so that edges are secured when grate is replaced. Periodically inspect and adjust bags. Because filter bags clog quickly, pay particular attention to water backing up around the drain inlet. Either replace the bags frequently or adjust upstream sediment dams to provide more sediment removal prior to drain inlet.
 - b. When the discharge is complete, allow any water that is ponded behind the dams to drain. Clean the flow path and upstream dams to remove residual sediment from the street. Retrieve all control equipment and remove temporary drain inlet bag.

Part 7: Water Discharge Awareness Course

The CFSM developed a sample course outline for this BMP manual. This part presents an overview of a joint effort to inform the water-based fire protection system contractors, business concerns and the fire service of these guidelines and provisions. The outline is intended to assist dischargers in developing a training plan for their employees to ensure compliance with local, state and federal law dealing with the waters of California.

1. The BMP outlined in this document are essential elements for a contractor and/or business concern to be aware of and to utilize in the day-to-day business company operations when discharging fire protection system waters. The Awareness Level Training Course will help ensure that the procedures outlined in this set of BMP are utilized

(see Appendix E).

- 2. The Water Discharge for Fire Protection Systems Awareness Level Course will provide the student with:
 - a. An awareness of the Water-Based Discharge for Fire Protection Systems BMP document and to become familiar with the water discharge requirements as they relate to water-based fire protection systems during the flowing of water for testing, draining, and maintenance of these systems.
 - b. An awareness of the necessary records, forms, and notification procedures deemed necessary to be in compliance with the various federal, state, regional, and local laws, regulations, and procedures relevant to the discharge of water.
 - c. An awareness of safety considerations, testing procedures, control equipment, clean-up equipment, and drain inlet protection.
 - d. An awareness and understanding of the need to identify the volume/quantity of water to be discharged during periodic flow testing and maintenance procedures and to recognize the thresholds which reflect the different levels of notifications and/or protocol.
 - e. An awareness of the federal, state, regional, and local law, regulations, and procedures relevant to the discharge of water into the lands, streets, storm drains, sewers, streams, creeks, rivers, lakes, bays, and oceans.
 - f. An awareness of the various federal, state, regional, and local agencies which are assigned the roles of enforcing these laws, regulations, and procedures and to understand the various acronyms associated with these agencies.

TABLE A

Outlet Nozzle Coefficient = 0.90

2006 revision.doc

12/18/2006

FORMULAS

Use the following formula to calculate the "observed" or measured flow rate based on the pitot measurement:

$$Q_f = 29.83 d^2 C \sqrt{P_o}$$
 (1)

Where:

Qf	=	measured flow rate (gpm)
d	=	inside diameter of flow outlet or stream diameter (inches)
P。	=	pitot measurement (psi)
С	=	coefficient of discharge*

* Use the typical value of 0.90 for the coefficient of discharge.

Sample calculation:

	=	coefficie	ent of	ed in the fi discharge ter of flow		=	35 psi 0.90 2.5 inches
Q _f	=	29.83 x	2.5 ²	x 0.90 x	√P₀		
	=	167.8 x	√35				
	=	167.8 x	5.9				
	=	992.7	or	993 gpm	(see T	ab	le A for comparison)

TABLE BTypical Discharge Types for Buildings that Require Testing by the
California State Fire Marshal

Table 5.1	Summary	of Sprinkler	System	Inspection,	Testing, an	nd Maintenance
-----------	---------	--------------	--------	-------------	-------------	----------------

Item	Activity	Frequency	Reference
Gauges (dry, preaction, and deluge systems)	Inspection	Weekly/monthly Quarterly	5.2.4.2, 5.2.4.3
Control valves	Inspection	Weekly/monthly Quarterly	Table 12.1
Alarm devices	Inspection	Quarterly	5.2.6
Gauges (wet pipe systems)	Inspection	Monthly Quarterly	5.2.4.1
Hydraulic nameplate	Inspection	Quarterly	5.2.7
Buildings	Inspection	Annually (prior to freezing weather)	5.2.5
Hanger/seismic bracing	Inspection	Annually	5.2.3
Hanger/seismic bracing in accessible concealed spaces	Inspection	5 Years	5.2.3.3
Pipe and fittings	Inspection	Annually	5.2.2
Pipe and fittings in accessible concealed spaces	Inspection	5 Years	5.2.2.3
Sprinklers	Inspection	Annually Quarterly	5.2.1
Sprinklers in accessible concealed spaces	Inspection	5 Years	5.2.1.1.4
Spare sprinklers	Inspection	Annually- Quarterly	5.2.1.3
Fire department connections	Inspection	Quarterly	Table 12.1
Valves (all types)	Inspection		Table 12.1
Alarm devices	Test	Quarterly/semiannually Annually	5.3.3
Main drain	Test	Annually	Table 12.1
Antifreeze solution	Test	Annually	5.3.4
Gauges	Test	5 years	5.3.2
Sprinklers — extra-high temperature	Test	5 years	5.3.1.1.1.3
Sprinklers — fast response	Test	At 20 years and every 10 years thereafter	5.3.1.1.1.2
Sprinklers	Test	At 50 years and every 10 years thereafter	5.3.1.1.1
Valves (all types)	Maintenance	Annually or as needed	Table 12.1
Obstruction investigation	Maintenance	5 years or as needed	13.2.1, 13.2.2
Low point drains (dry pipe system)	Maintenance	Annually prior to freezing and as needed	12.4.4.3.3

Table 6.1 Summary of Standpipe and Hose Systems Inspection, Testing, and Maintenance

Item	Activity .	Frequency	Reference
Control valves	Inspection	Weekly/monthly Quarterly	Table 12.1
Pressure regulating devices	Inspection	Quarterly	Table 12.1
Piping	Inspection	Quarterly-Semi-Annually	6.2.1
Hose connections	Inspection	Quarterly Semi-Annually	Table 12.1
Cabinet	Inspection	Annually Semi-Annually	NFPA 1962
Hose	Inspection	Annually Semi-Annually	NFPA 1962
Hose storage device	Inspection	Annually Semi-Annually	NFPA 1962
Alarm device	Test	Quarterly Annually	Table 12.1
Hose nozzle	Test	Annually	NFPA 1962
Hose storage device	Test	Annually 5 years	NFPA 1962
Hose	Test	5 years/3 years	NFPA 1962
Pressure control valve	Test	5 years	Table 12.1
Pressure reducing valve	Test	5 years	Table 12.1
Hydrostatic test	Test	5 years	6.3.2
Flow test	Test	5 years	6.3.1
Main drain test	Test	Annually	Table 12.1
Hose connections	Maintenance	Annually	Table 6.2.2
Valves (all types)	Maintenance	Annually/as needed	Table 12.1

NOTE: — Strikeout items are not applicable in California Shaded (screened) items are California amendments

Each table reprinted with the permission of the NFPA From NFPA 25, 2006 California Edition

Item	Activity	Frequency	Reference
Hose houses	Inspection	Quarterly	7.2.2.7
Hydrants (dry barrel and wall)	Inspection	Annually and after each operation	7.2.2.4
Monitor nozzles	Inspection	Semiannually	7.2.2.6
Hydrants (wet barrel)	Inspection	Annually and after each operation	7.2.2.5
Mainline strainers	Inspection	Annually and after each significant flow	7.2.2.3
Piping (exposed)	Inspection	Annually	7.2.2.1
Piping (underground)	Inspection	See 7.2.2.2	7.2.2.2
Monitor nozzles	Test	Flow annually (range and operation)	7.3.3
Hydrants	Test	Flow annually	7.3.2
Piping (exposed and underground)	Flow test	5 years	7.3.1
Mainline strainers	Maintenance	Annually and after each operation	7.4.2
Hose houses	Maintenance	Annually	7.4.5
Hydrants	Maintenance	Annually	7.4.3
Monitor nozzles	Maintenance	Annually	7.4.4

Table 8.1 Summary of Fire Pump Inspection, Testing, and Maintenance

Item	Activity	Frequency	Reference
Pump house, heating ventilating louvers	Inspection	Weekly	8.2.2(1)
Fire pump system	Inspection	Weekly	8.2.2(2)
Pump operation	-		
No-flow condition	Test	Weekly	8.3.1
Flow condition	Test	Annually	8.3.3.1
Hydraulic	Maintenance	Annually	8.5
Mechanical transmission	Maintenance	Annually	8.5
Electrical system	Maintenance	Varies	8.5
Controller, various components	Maintenance	Varies	8.5
Motor	Maintenance	Annually	8.5
Diesel engine system, various components	Maintenance	Varies	8.5

Table 9.1 Summary of Water Storage Tank Inspection, Testing, and Maintenance

Item	Activity	Frequency	Reference
Condition of water in tank	Inspection	Monthly/quarterly*	9.2.1
Water temperature	Inspection	Daily/weekly*	9.2.4
Heating system	Inspection	Daily/weekly*	9.2.6.6
Control valves	Inspection	Weekly/monthly Quarterly	Table 12.1
Water — level	Inspection	Monthly/quarterly	9.2.1
Air pressure	Inspection	Monthly/quarterly	9.2.2
Tank — exterior	Inspection	Quarterly	9.2.5.1
Support structure	Inspection	Quarterly	9.2.5.1
Catwalks and ladders	Inspection	Quarterly	9.2.5.1
Surrounding area	Inspection	Quarterly	9.2.5.2
Hoops and grillage	Inspection	Annually	9.2.5.4
Painted/coated surfaces	Inspection	Annually	9.2.5.5
Expansion joints	Inspection	Annually	9.2.5.3
Interior	Inspection	5 years/3 years	9.2.6
Check valves	Inspection	5 years	Table 12.1
Temperature alarms	Test	Monthly*	9.2.4.2, 9.2.4.3
High temperature limit switches	Test	Monthly*	9.3.4
Water level alarms	Test	Semiannually	9.3.5
Level indicators	Test	5 years	9.3.1
Pressure gauges	Test	5 years	9.3.6
Automatic Filling Device	Test	5 years	9.3.7
Water level	Maintenance	2/J. (2010)	9.4.1
Drain silt	Maintenance	Semiannually	9.4.5
Control valves	Maintenance	Annually	Table 12.1
Embankment-supported coated fabric (ESCF)	Maintenance		9.4.6
Check valves	Maintenance	·	12.4.2.2

*Cold weather/heating season only.

NOTE: — Strikeout items are not applicable in California Shaded (screened) items are California amendments

Appendix C Record & Notification Form for Water-Based Fire Protection Systems Discharges

Record & Notification Sample Form for Water-Based Fire Protection Systems Discharges

Total gallons discharged:

>10,000 gallons – Please fill out form completely.

Between >1,500 and 10,000 gallons – Please fill out Part A only.

PART A	PART B
Name of Discharger:	Date of Notification
Location of Discharge: Date of Discharge: Time Frame of Discharge: (Begin)(End)	Method of Notification
Duration of Discharge (Minutes) Discharge Flow Rate (gpm) Total Gallons Discharged	
Dechlorination Chemicals Used: Chlorine Residual Concentration (After Dechlorination, in mg/l)_	
Location of Monitoring	
Description of Sediment Controls Used:	

SAMPLE FORM

Note: Information is required when notifying MS4

Appendix D Pictures of Sediment Control Equipment

Wattle and Municipal Sewer Protection

Typical Sandbag

Examples of Sediment Control Equipment

Typical Dechlorinator with De-Chlorination Tablet

Gravel Bag

Mats and Wattle Erosion Protection

Synthetic and Straw Booms

Examples of Sediment Control Equipment

Silt Fence

Barricade Utilizing Silt Fence and Hay Bales

Utilization of Hose to Apply Groundwork Protection

Filter Bag

Filter Bag with Sandbags Protecting Municipal Sewer

These photos were obtained from various public websites

Appendix E Awareness Course Outline

Water Discharge for Fire Protection Systems Awareness Level Training Course Outline

Course Objectives: To provide the student with an awareness of:

- a. The Water-Based Fire Protection Systems Discharge Best Management Practices during testing, draining, and maintenance of these systems.
- b. The records, forms, and notification procedures necessary for compliance with federal, state, regional, and local, water discharge laws and, regulations.
- c. Safety considerations, testing procedures, control equipment, and drain inlet protection.
- d. An understanding of the need to identify the volume/quantity of water discharged during testing and maintenance procedures.
- e. The reporting thresholds which reflect the different levels of notifications and/or protocols.
- f. The various federal, state, regional, and local agencies assigned the role of enforcement.

Course Content (2-1/2-hours to 3-hours)

1-1 **Orientation and Administration**

- 1-1.1 Introduction of Instructor(s)
- 1-1.2 Overview of Student Manual/Handouts
- 1-1.2 Self Introductions

1-2 Water Discharge for Fire Protection Task Force

- 1-2.1 Brief History
 - 1-2.1.1 Scope Goals and Objectives
 - 1-2.1.2 Timeline
 - 1-2.1.3 Development of the BMP
 - 1-2.1.4 Guidelines
 - 1-2.1.5 Awareness Training

2-1 **Overview of Best Management Practices**

- 2-1.1 Typical Activities Associated with Water-based Fire Protection Systems
 - 2-1.1.1 Pre-construction Flow Testing
 - 2-1.1.2 Construction Testing and Draining
 - 2-1.1.3 Additions, Alterations and Modifications to Existing Systems

- 2-1.1.4 Periodic Inspection, Testing, and Maintenance
 - 2.1.1.4.1 Title 19 California Code of Regulations (CCR) and NFPA 25 2006 (CA Edition)
- 2-1.2 Emergency Repairs on Water-based Fire Protection Systems
 - 2.1.2.1 Repairs following a fire/explosion
 - 2-1.2.2 Repairs following an earthquake
 - 2-1.2.3 Repairs following a structural failure
- 2-1.3 Discharges Associated with Water-based Fire Protection Systems
 - 2-1.3.1 General Engineering Contractor A (CSLB) 2-1.3.1.1 – Underground Piping only
 - 2-1.3.2 Fire Protection Contractor C-16 (CSLB)
 - 2-1.3.2.1 Overhead and Underground Piping
 - 2-1.3.3 Pipeline Contractor C-34 (CSLB)
 - 2-1.3.3.1 Underground Piping only
 - 2-1.3.4 Plumbing Contractor C-36 (CSLB)
 - 2-1.3.4.1 Underground Piping only
 - 2-1.3.5 Electrical Contractor C-10 (CSLB)
 - 2-1.3.5.1 Water-flow Fire Alarm only
 - 2-1.3.6 SFM A-Licensed Concern/Company (CSFM)
 - 2-1.3.6.1 Inspection, Testing and Maintenance only

3-1 **Participants vs. Regulations**

- 3-1.1 Fire Protection Contractors (Discharges)
 - 3-1.1.1 Routine Discharge vs. Emergency Discharge
- 3-1.2 Fire Departments/Agencies
 - 3-1.2.1 Emergency Discharge vs. Non-emergency Discharge
- 3-1.3 Water Purveyors
 - 3-1.3.1 Routine Discharge vs. Emergency Discharge
- 3-1.4 Water Pollution Control Facilities

3-1.4.1 – Reclamation Procedures

- 3-1.5 MS4
 - 3-1.5.1 Municipal Separate Storm Sewer Systems
- 3-1.6 Regional Water Quality Control Boards
 - 3-1.6.1 Nine (9) Regional Areas/Boards
 - 3-1.6.1.1 Independent/Autonomous
- 3-1.7 State Water Resources Control Board
 - 3-1.7.1 Water Discharge Requirements (WDR)
 - 3-1.7.1.1 Title 23 CCR
- 3-1.8 U.S. Environmental Protection Agency (EPA)

3-1.8.1 – National Pollution Discharge Elimination System (NPDES)

4-1 Notification Requirements/Procedures

- 4-1.1 When to notify
- 4-1.2 Discharges < 1,500 gallons vs. > 1,500 gallons
- 4-1.3 Discharges > 10,000 gallons
- 4-1.4 Notification Method
 - 4-1.4.1 Telephone
 - 4-1.4.2 Fax Transmission
 - 4-1.4.3 E-mail
 - 4-1.4.4 In Person

5-1 Information Provided by Discharger for Notification

- 5-1.1 Recordkeeping
 - 5-1.1 Use of approved MS4 Forms (where available)
- 5-1.2 Method of Maintaining Records
 - 5-1.2.1 Bound Notebook
 - 5-1.2.2 Portable Electronic Device
- 5-1.3 Entries Recorded on Paper
 - 5-1.3.1 Black or Blue Ink

5-2 **Discharger Records (information) for Discharges > 1,500 gallons**

- 5-2.1 Name of Discharger
- 5-2.2 Date of notification (if greater than or equal to 10,000 gallons)
- 5-2.3 Method of notification (if greater than or equal to 10,000 gallons)
- 5-2.4 Location of discharge
- 5-2.5 The date of the discharge
- 5-2.6 The time of the beginning and end of the discharge
- 5-2.7 Duration of the discharge (minutes)
- 5-2.8 The flow rate (gallons per minute)
- 5-2.9 Total number of gallons discharged
- 5-2.10 Type of Dechlorination "chemicals" used
- 5-2.11 Concentration of chlorine measured after Dechlorination
- 5-2.12 Type of sediment controls used

5-3 Record Maintenance

5-3.1 Dischargers must maintain all records, including emergency discharges, for a minimum of five years and must have the records available for review by the MS4 upon request.

6-1 Volume Control during Emergency Repairs

- 6-1.1 During emergency discharges, the Dischargers will attempt to cease the release of water at the earliest opportunity while attempting to implement BMP to the extent feasible.
- 6-1.2 Exact flows, volumes, and length of discharge may not be available. In this situation, estimated values should be established and recorded.

6-2 Volume Determination

- 6-2.1 Water Discharge for Typical Fire Protection System Chart
 - 6-2.1.1 Flow and Volume Determination Dischargers must determine the flow and volume discharge.
 - 6-2.1.2 By attaching a flow meter to the discharge opening and simply reading the displayed value.
 - 6-2.1.3 By measuring the pressure from a pressure gauge and then using the table or formulas found in **Appendix B**.

7-1 Safety Considerations

- 7-1.1 Sensitive Discharge Areas
- 7-1.2 Are road surface areas free of debris that may flow into the drain inlets or nearby creeks or ponds?
- 7-1.3 Are curbs or ditches adequate to handle the flow without creating a buildup of silt that cannot be contained and removed?
- 7-1.4 Will the water flow be free of contaminants such as oil, contaminated soils, etc.?
- 7-1.5 Will water movement during the flow test create erosion in any unpaved areas?
- 7-1.6 Flow for the shortest duration possible (e.g., MS4 may limit maximum flow rate to storm sewer where discharge flows could be very large)
- 7-1.7 Remove all debris from the curb and gutter before initiating flushing
- 7-1.8 Use Dechlorination when chlorine residual is a concern
 - 7-1.8.1 Many, if not most, inspection, testing and maintenance discharges will not have chlorine residual due to water age in the sprinkler system and thus will not need dechlorination. If CWS water is introduced during testing and is then discharged, it will require dechlorination.
- 7-1.9 Contain flow onsite whenever possible and/or direct the water flow to landscaped or green areas without causing damage or erosion.
- 7-1.10 When practicable, divert sprinkler system test flow to the sewer with the permission of the local sewer agency.

- 7-1.10.1 The local sewer agency will likely set conditions so plan ahead.
- 7-1.11 A sensory checklist method (SCM) is completed for any partial or full discharge of vault, substructure or building fire system water to the street or storm drain system.

8-1 **Dechlorination**

8-1.1 The MS4 General NPDES Permit requires all waters discharged by Dischargers to be dechlorinated before entering a storm drain

8-2 **Dechlorination Equipment**

- 8-2.1 Mesh Bags
 - 8-2.1.1 These consist of a mesh bag into which large tablets of dry chemical are placed to react with residual chlorine to remove it
- 8-2.2 Flow Meter (optional)
- 8-2.3 Pressure Gauge
- 8-2.4 Pitot Tube
- 8-2.5 Dechlorination chemicals
- 8-2.6 Diffusers These are mechanical devices which are placed on the end of the discharge point and which automatically mixes the discharged water with either dry or wet dechlorination chemicals. There are a wide variety of diffusers available.
- 8-2.7 Chlorine Residual Test Kits

8-3 **Dechlorination Chemicals**

- 8-3.1 Sodium Sulfite
- 8-3.2 Sodium Bisulfate
- 8-3.3 Sodium Thiosulfate
- 8-3.4 Ascorbic Acid

8-4 Chlorine Residual Test Kits

- 8-4.1 Test Strips
- 8-4.2 Color wheels
- 8-4.3 Electric Colorimeters
- 8-4.4 Sediment Control
- 8-4.5 Advantages and Limitation

9-1 Control Equipment

9-1.1 Wattles

- 9-1.2 Sand Bags 9-1.3 Gravel bags 9-1.4 Mats 9-1.5 Booms 9-1.6 Barricades 9-1.7 Silt Fencing 9-1.8 Hay Bales
- 9-1.9 Hoses
- 9-1.10 Filters

9-2 Clean-up Equipment

- 9-2.1 Debris Storage
- 9-2.2 Brooms
- 9-2.3 Shovels
- 9-2.4 Rakes
- 9-2.5 Vacuum truck or vacuum
- 9-2.6 Procedure
- 9-2.7 Sand or Gravel Bags
- 9-2.8 Dams
- 9-2.9 Number, Length and Height

9-3 Drain Inlet Protection

- 9-3.1 Determining Flow of Path
- 9-3.2 Alignment of Discharge Point
- 9-3.3 Preparing Flow Path for Discharge
- 9-3.4 Chlorination and Sediment Control
- 9-3.5 Adding Chlorination Concentration
- 9-3.6 Measuring Chlorination Concentration

10-1 Historical Overview of Various Laws, Regulations, and Procedures

10-1.1 Federal (Clean Water Act)

- 10-1.1.1 Federal Water Pollution Control Act (1972)
 - 10-1.1.1 National Pollutant Discharge Elimination System (NPDES)
 - 10-1.1.1.2 Municipal and Industrial Storm Water Discharge (1987)
- 10-1.2 EPA Published Regulations (1990)
 - 10-1.2.1 Construction Projects encompassing five (5) or more acres
 - 10-1.2.2 EPA Regulation (Phase II Rule) lowered storm water discharge from five (5) to one (1) acre (1999)

10-1.3 State (Title 23 CCR – Waters) 10-1.3.1 – General Construction Storm Water Permits (1999) 10-1.3.1.1 – Water Quality Order 99-08-DWQ

- 10-1.3.2 SWRCB amended Order 99-08-DWQ to apply to sites as small as one (1) acre.
- 10-1.3.3 Water Quality Order 2009 0009 DWQ
- 10-1.4 Porter-Cologne Water Quality Control Act

11-1 Appendix Information

12-1 Conclusions

12-1.1 Complete Class Evaluation Forms

13-1 Questions and Answers

Glossary of Terms

GLOSSARY OF TERMS

American Water Works Association (AWWA): An international nonprofit professional organization dedicated to the improvement of water quality and supply. Founded in 1881, it has a membership of over 57,000 members worldwide as of 2010 and is the largest organization of water professionals in the world, representing more than 100 countries. AWWA members represent the full spectrum of the water community: water utilities, treatment plant operators and managers, scientists, environmentalists, manufacturers, academics, regulators, and others with an interest in water supply and public health. These members provide about 85 percent of the North American population with safe drinking water.

Best Management Practices (BMP): A compilation or an industry standard method to prevent or reduce the adverse effects of an action or process to the environment. Refers to those practices that have produced outstanding results in another situation and that could be adapted for our situation.

Clean Water Act (CWA): This is the primary federal law in the United States governing water pollution. Commonly abbreviated as the CWA, the act established the goals of eliminating releases of high amounts of toxic substances into water, eliminating additional water pollution by 1985, and ensuring that surface waters would meet standards necessary for human sports and recreation by 1983. The principal body of law currently in effect is based on the Federal Water Pollution Control Amendments of 1972, which significantly expanded and strengthened earlier legislation. Major amendments were enacted in the Clean Water Act of 1977 and the Water Quality Act of 1987.

Community Water Systems (CWS): A central system, owned, operated and maintained by a private corporation or a non-profit property owners association or city, county or water agency or district.

Dechlorination: A procedure that addresses chlorine residual in the discharged water. It is accomplished by adding an environmentally safe dechlorination chemical to the discharge flow to neutralize the chlorine residual. Using dechlorination in combination with the natural demand for chlorine, discharges entering the storm drain inlet should have negligible or non-detectable chlorine residual. Dechlorination can also be achieved by aeration of the discharged water through the use of a diffuser and by flowing along the ground a minimum distance to remove the chlorine.

Discharger: The person or company that caused non-storm water discharges water into the storm drain system.

A-Licensed Concern (company, firm, or individual): A license issued by the CSFM which is engaged in the business of servicing automatic fire extinguishing systems. This license is divided into four separate categories:

- a. Type 1 Fire Sprinkler Systems
- b. Type 2 Engineered and Pre-engineered Fixed Extinguishing Systems
- c. Type 3 Standpipe Systems
- d. Type L Limited to public or private entities that are not engaged in the business of performing testing and maintenance of wet fire extinguishing systems and which only perform annual testing and maintenance of wet pipe sprinkler systems, standpipe systems, private fire service mains, and weekly fire pump tests in structures or property owned or leased by that public or private

A-Classification Contractor – General Engineering Contractor: A license issued by the CSLB. The "A-General Engineering Contractor" is a contractor whose principal contracting business is in connection with fixed works requiring specialized engineering knowledge and skill, including the following divisions or subjects: irrigation, drainage, water power, water supply, flood control, inland waterways, harbors, docks, and wharves, shipyards and ports, dams and hydroelectric projects, levees, river control and reclamation work, railroads, highways, streets and roads, tunnels, airports, and airways, sewers and sewage disposal plants and systems, waste reduction plants, bridges, overpasses, underpasses, and other similar works, pipelines and other systems for the transmission of petroleum and other liquids or gaseous parks, substances, playgrounds and other recreational works, refineries, chemical plants and similar industrial plants requiring specialized engineering knowledge and skill, powerhouses, power plants and installations, plants and other utility mines and metallurgical plants, land leveling and earthmoving projects, excavating, grading, trenching, paving and surfacing work and cement and concrete work in conjunction with the above mentioned fixed works (California Business and Professions [B&P] Code, Section 7056).

C-10 License – Electrical Contractor: A specialty contractor classification license issued by the CSLB that performs their trade using the art, experience, science and skill necessary to satisfactorily organize, administer, construct and complete projects under their

classification in accordance with the standards of their trade. An electrical contractor places, installs, erects or connects any electrical wiring, fixtures, appliances, apparatus, raceways, conduits, solar photovoltaic cells or any part thereof, which generates, transmits, transform or utilize electrical energy in any form.

C-16 License – Fire Protection Contractor: A specialty contractor classification license issued by the CSLB that performs their trade using the art, experience, science and skill necessary to satisfactorily organize, administer, construct and complete projects under their classification in accordance with the standards of their trade. A fire protection contractor (C-16) lays out, fabricates and installs all types of fire protection systems including all the equipment associated with these systems, excluding electric alarm systems (B&P Code, Sections 7055(c) and 832.16).

C-34 License – Pipeline Contractor: A specialty contractor classification license issued by the CSLB that performs their trade using the art, experience, science and skill necessary to satisfactorily organize, administer, construct and complete projects under their classification in accordance with the standards of their trade.

A pipeline contractor fabricates and installs pipelines for the conveyance of fluids, such as water, gas, or petroleum, or for the containment or protection of any other material, including the application of protective coatings or systems and the trenching, boring, shoring, backfilling, compacting, paving and surfacing necessary to complete the installation of such pipelines (B&P Code, Sections 7055(c) and 832.34).

C-36 License – Plumbing Contractor: A specialty contractor classification license issued by the CSLB that performs their trade using the art, experience, science and skill necessary to satisfactorily organize, administer, construct and complete projects under their classification in accordance with the standards of their trade. A plumbing contractor provides a means for a supply or safe water, ample in volume and of suitable temperature for the purpose intended and the proper disposal of fluid waste from the premises in all structures and fixed works. This classification includes but is not limited to:

- a. Complete removal of waste from the premises or the construction and connection of onsite waste disposal systems;
- b. Piping, storage tanks and venting for a safe and adequate supply of gases and liquids for any purpose, including

vacuum, compressed air and gases for medical, dental, commercial and industrial uses;

- c. All gas appliances, flues and gas connections for all systems including suspended space heating units. This does not include forced warm air units;
- d. Water and gas piping from the property owner's side of the utility meter to the structure or fixed works;
- e. Installation of any type of equipment to heat water, or fluids, to a temperature suitable for the purposes listed in this section, including the installation of solar equipment for these purposes; and
- f. The maintenance and replacement of all items described above and all health and safety devices such as, but not limited to, gas earthquake valves, gas control valves, backflow preventers, water conditioning equipment and regulating valves (B&P Code, Sections 7055(c) and 832.36).

Emergency Discharges: Non-routine activities where discharges are the result of unintended releases due to accidents or disasters not under the control of the Discharger. These activities may occur at anytime. Examples of emergency discharges include sheared private onsite fire hydrants, broken sprinklers and/or piping.

Environmentally Sensitive Area (ESA): Areas in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would easily be disturbed or degraded by human activities and developments (California Public Resources Code, Section 30107.5). ESAs subject to urban runoff requirements include but are not limited to all CWA section 303(d) impaired water bodies, areas designated as "State Water Quality Protection Areas," inclusive of "Areas of Special Biological Significance" by the SWRCB (Ocean Plan), water bodies designated with the RARE beneficial use by the RWQCBs (Basin Plans), and any other equivalent environmentally sensitive areas which the permittees have identified.

Municipal Separate Storm Sewer System Operator (MS4): The operators of storm drainage systems and are usually municipalities. Under Phase I of the NPDES Storm Water program, MS4 with a service population greater than 100,000 are required to have an NPDES MS4 permit for their storm water discharges. Phase II of the NPDES Storm Water program was promulgated on February 7, 2000, and addresses MS4 with populations under 100,000.

National Fire Protection Association (NFPA): The National Fire Protection Association (NFPA) is an international non-profit organization established in 1896. The company's mission is to reduce the worldwide burden of fire and other hazards on the quality of life by providing and advocating consensus codes and standards, research, training, and NFPA is responsible for 300 codes and standards that are education. designed to minimize the risk and effects of fire by establishing criteria for building, processing, design, service, and installation in the United States, as well as many other countries. Its more than 200 technical code- and standard- development committees are comprised of over 6,000 volunteer Volunteers vote on proposals and revisions in a process that is seats. accredited by the American National Standards Institute (ANSI).

- a. NFPA-13 Standard for the Installation of Sprinkler Systems, 2010 Edition.
- b. NFPA-13R Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height, 2010 Edition.
- c. NFPA-13D Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes, 2010 Edition.
- d. NFPA-14 Standard for the Installation of Standpipe and Hose Systems, 2007 Edition.
- e. NFPA-15 Standard for Water Spray Fixed Systems for Fire Protection, 2007 Edition.
- f. NFPA-16 Standard for the Installation of Foam-Water Sprinkler and Foam-Water Spray Systems, 2007 Edition.
- g. NFPA-20 Standard for the Installation of Stationary Pumps for Fire Protection, 2007 Edition.
- h. NFPA-22 Standard for Water Tanks for Private Fire Protection, 2003 Edition.
- i. NFPA-24 Standard for the Installation of Private Fire Service Mains and Their Appurtenances, 2010 Edition.
- j. NFPA-25 Standard for the Installation of Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems. *Special Note:* The CSFM has adopted and amended the 2002 Edition of NFPA-25 and published the "NFPA-25 2006 California Edition."

National Pollution Discharge Elimination System (NPDES): As authorized by the Clean Water Act, the NPDES permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. Point sources are discrete conveyances such as pipes or human-made ditches. Individual homes that are connected to a municipal system, use a septic system, or do not have a surface discharge do not need an NPDES permit; however, industrial, municipal and other facilities must obtain permits if their discharges go directly to surface waters.

Permeable Surface: A surface that will allow water to seep into it.

Porter-Cologne Water Quality Control Act: In 1969, the California Legislature enacted the Porter-Cologne Water Quality Control Act to preserve, enhance and restore the quality of the State's water resources. The Act established the State Water Resources Control Board and nine Regional Water Quality Control Boards as the principal state agencies with the responsibility for controlling water quality in California. Under the Act, water quality policy is established, water quality standards are enforced for both surface and ground water, and the discharges of pollutants from point and non-point sources are regulated. The Act authorizes the State Water Resources Control Board to establish water quality principles and guidelines for long range resource planning including ground water and surface water management programs and control and use of recycled water.

Potable Water: Water that is distributed through a community water system. Water from a fire sprinkler system is not considered potable water.

Receiving Body: A storm sewer system or storm drain system.

Regional Water Quality Control Boards (RWQCB): There are nine Regional Water Quality Control Boards (RWQCBs) statewide (Region 1-North Coast, 2-San Francisco Bay Area, 3-Central Coast, 4-Los Angeles, 5-Central Valley, 6-Lahontan, 7-Colorado River Basin, 8-Santa Ana, and 9-San Diego). The nine RWQCB are comprised of nine part-time Board members appointed by the Governor and confirmed by the senate. Regional boundaries are based on watersheds and water quality requirements on the unique differences in climate, topography, geology, and hydrology for each watershed. Each RWQCB makes critical decisions for its region, including setting standards, issuing waste discharge requirements, determining compliance with those requirements, and taking appropriate enforcement action. **See Appendix C** for the RWQCB contact list.

Sediment: Solid particulate matter, both mineral and/or organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

Sedimentation: Process of deposition of sediment carried by water, wastewater, or other liquids, by gravity. It is usually accomplished by reducing the velocity of the liquid below the point at which it can transport the suspended material.

Sediment Control BMP: Describe practices that trap sediment after they have been eroded by rain, flowing water, or wind. They include those practices that intercept and slow or detain the flow of storm water to allow sediment to settle and be trapped (e.g., silt fence, sediment basin, fiber rolls, etc.).

Sensitive Discharge Areas: Areas where water discharges may present a potential problem or hazard to the natural environment (such as creeks).

Sensory Checklist Method: A BMP checklist of activities to be completed for any partial or full discharge of vault, substructure or building fire system water to the street or storm drain system. Primary sensory methods include visual observation and odor.

State Water Resources Control Board (SWRCB): Created by the State Legislature in 1967, the five-member Board protects water quality by setting statewide policy, coordinating and supporting the RWQCB efforts, and reviewing petitions that contest RWQCB actions. The SWRCB is also solely responsible for allocating surface water rights.

Storm Sewer System or Storm Drain System: The drainage system used to divert storm water runoff from its source to the final receiving water. Systems include but are not limited to: culverts, street gutters, swales, brooks, creeks, rivers, ponds, lakes, aqueducts and the ocean.

Water Discharge Mitigation: The management of erosion, debris, and sediment during the discharge of water through the use of BMP.

Waters of the State (California): Any surface water or groundwater, including saline waters, that is within the boundaries of the state" (California Water Code, Section 13050(e)); broadly construed to include all waters within the state's boundaries, whether private or public, including waters in both natural and artificial channels.
