August 25, 1999

Ed Gee, Forest Supervisor
Lake Tahoe Basin Management Unit
870 Emerald Bay Road, Suite 1
South Lake Tahoe, CA 96150

Ex C1

Dear Mr. Gee:

NOTICE OF VIOLATION - DISCHARGES OF WASTES IN EXCESS OF LAHONTAN BASIN PLAN WATER QUALITY OBJECTIVES FOR FECAL COLIFORM ON USFS/LTBMU GRAZING ALLOTMENTS

BACKGROUND

The U.S. Forest Service (USFS) Lake Tahoe Basin Management Unit (LTBMU) manages three grazing allotments for large animals on public lands in the southern portion of the Lake Tahoe basin watershed: (1) Cattle on the Meiss Meadows allotment in the upper reaches of the Upper Truckee River subwatershed, (2) Horses on the Baldwin allotment in the Tallac Creek subwatershed, and (3) Cattle on the Cold Creek allotment in the Cold Creek subwatershed.

The USFS/LTBMU and the Lahontan Regional Water Quality Control Board (LRWQCB) have been working together to monitor, assess and mitigate where necessary, the impacts of these activities to riparian and water quality since about 1993.

The general conceptual approach taken to assess and mitigate grazing impacts has followed the guidelines of the *Nonpoint Source Management Plan* (SWRCB, 1988), and the more specific *California Rangeland Water Quality Management Plan* (SWRCB, 1995). The approach is designed to minimize the amount of regulatory involvement necessary to achieve water quality objectives. The management approaches range (in sequential order of increased stringency) from: (1) Voluntary implementation of Best Management Practices (BMPs); (2) Regulatory-based encouragement of BMPs; and (3) effluent limitations. For Federal institutions with management responsibility for publicly owned lands, such as the USFS, the preferred mechanism to achieve nonpoint source controls is implementation of BMPs under an appropriate management agency agreement (MAA). None of these approaches precludes the Regional Board from exercising its full legal authority to protect waters of the State when no other solution is viable, including: notices of violation (NOV), cease and desist orders (CDO), and further enforcement action, as necessary, such as referral to the State Attorney General's Office for legal remedy.

Figures 1 and 2 (Attachment No. 1) depict the trends in fecal coliform concentrations at three-water quality monitoring stations in Meiss Meadows during the grazing seasons of 1996 and 1997, respectively. All available fecal coliform data from 1991 through 1997 are given in

California Environmental Protection Agency

Recycled Paper

Attachment No. 3. Large and clear impacts were detected at the Big Meadows (BM) station immediately after commencement of grazing. Impacts of a lesser magnitude were detected later in the grazing season at the Upper Truckee River (UTR) station and at the Round Lake Tributary (RLT) station. Some significant fecal coliform concentrations were detected at the RLT station after the cows were reputedly gone. Given the "hot source" nature of fecal coliform as an indicator of fecal contamination, an unknown alternate source of fecal coliform is indicated during this time frame. Possible other sources could be wildlife or recreation-related human activities, including dogs, and pack or riding horses.

Figures 3, 4, and 5 (Attachment No. 1) give the trends at two water quality monitoring stations located on Tallac Creek above and below the Baldwin Allotment during the grazing seasons of 1995, 1996, and 1997, respectively. All available fecal coliform data from 1993 through 1997 are given in Attachment No. 3. During grazing, the Tallac Creek at Lake Tahoe (TCLT) station generally showed elevated fecal coliform concentrations above that of the Tallac Creek at Highway 89 (TC89) station upstream of the allotment. Occasional elevated fecal coliform concentrations at the TC89 station are reportedly from upstream beaver populations, though this has not been confirmed. The off-site source is particularly notable in the 1997 data after the horses have reportedly been taken off the allotment.

VIOLATIONS

Water Quality Objectives for coliform bacteria the Lake Tahoe Basin are as follows:

Waters shall not contain concentrations of coliform organisms attributable to anthropogenic sources, including human and livestock wastes.

The fecal coliform concentration during any 30-day period shall not exceed a log mean of 20/100 ml, nor shall more than 10 percent of all samples collected during any 30-day period exceed 40/100 ml. *The log mean shall ideally be based on a minimum of not less than five samples collected as evenly spaced as practicable during any 30-day period. However, a log mean concentration exceeding 20/100 ml for any 30-day period shall indicate violation of this objective even if fewer than five samples were collected.*

- The Lahontan Regional Water Quality Control Board Basin Plan, 1993

Fecal coliform water quality objectives were violated as shown in Tables 1 and 2 (Attachment No. 2) for the Meiss and Baldwin Allotments, respectively. Data used to determine days of violations are in Attachment No. 4. Figure 6 (Attachment No. 2) outlines the procedure for determination of violations of water quality objectives.

Meiss Allotment Violations (Table 1, Attachment No. 2)

Big Meadows showed violations of fecal coliform standards in August of 1991 and 1993, presumably when cattle were present, though information regarding the timing and duration of these grazing seasons was not available. No violations were found at Big Meadows for the early season of 1994, when cows were not present. Likewise, no violations were found in the 1995 season for the Big Meadows (BM), Upper Truckee River (UTR), and Round Lake Tributary (RLT) stations. Cattle were not present during 1995. There were no violations during mid-July and August 1995, when cattle would usually be present, indicating that background sources, such as beavers, are not a significant source during periods of active grazing.

In 1996, during the period of time cattle were present, fecal coliform water quality objectives were violated 100% of the time at Big Meadows, and during the latter half of the grazing season at the UTR and RLT stations. No violations occurred before or after cattle were grazed in 1996.

Data for 1997 showed a similar trend, though there were some violations after the cattle were reportedly removed from the allotment.

Generally, when livestock were present, there were violations of fecal coliform water quality objectives. When livestock were absent, there were generally no violations of fecal coliform water quality objectives. The exception was the UTR and RLT stations in 1997 after the grazing period ended. The source of this fecal contamination is unknown, though it is unlikely that it came from residual livestock fecal coliform, since these typically die after a couple of days in the natural environment. Possible sources are either human wilderness activities or wildlife.

Baldwin Allotment Violations (Table 2, Attachment No. 2)

Trends in violations of the fecal coliform water quality objectives were similar to that found in Meiss Meadows. During the grazing period, violations occurred for virtually the entire period of record. However, the Baldwin allotment showed considerably more background fecal contamination before and after horses were on the allotment at the lower Tallac Creek station (before in 1995 and 1996, after in 1997). The upgradient site, at the Upper Tallac Creek station, showed no significant fecal contamination, with the exception of the 1997 season during the period horses were on the allotment. This suggests the source of the background fecal contamination is located between the upper and lower stations. These sources must be isolated and factored out in future monitoring efforts if consistent information is to be collected relating anthropogenic sources with aquatic fecal coliform concentrations in Tallac Creek.

CURRENT STATUS

In response to LRWQCB concerns, the USFS/LTBMU implemented the following improvements to the Meiss allotment at Big Meadows during or by the Summer of 1996: (1) construction of a public crossing for the designated trail over Big Meadows Creek at the lower end of Big Meadows; (2) installation of an enclosure upstream from the crossing providing protection for approximately 850 linear meters of stream reach; (3) stream restoration with

plantings of willows within the enclosure and physical stabilization of the headcut at the upper end of the Big Meadow enclosure with cobble and filter cloth. Additionally, the Meiss allotment was given one year of rest during the 1998 season.

Despite these efforts, fecal coliform has been detected in surface waters at concentrations in excess of Lahontan Basin Plan water quality objectives during periods of active grazing in a spatiotemporal pattern that suggests the allotted cattle or horses are the sources. Several violations of the less stringent USEPA water quality criteria for fecal coliform occurred during this period of time as well. The Forest Service needs to either implement more effective management strategies, BMPs, or discontinue allowance of grazing on these allotments. This year, the USFS staff committed to require the permittees to increase herding to better distribute cattle and rotate use of pastures.

The USFS staff has indicated to Regional Board staff that grazing can be excluded from a major portion of the Tallac Creek stream banks in the Baldwin allotment.

FUTURE MONITORING AND IMPLEMENTATION REQUIREMENTS

As discussed with USFS staff, we require the USFS to continue monitoring. Monitoring will be conducted prior to grazing, during grazing and after grazing. At least 5 samples will be taken at each location within a 30-day period. The Regional Board can no longer provide resources for monitoring. We understand the USFS will conduct monitoring at the following locations:

Big Meadows: (1) the downstream edge of the enclosure boundary, (2) the head of the meadow, and (3) at the downstream end of Big Meadows. The USFS is moving the location of the lower Big Meadows sampling station to the enclosure boundary to factor out the influence of human recreational activities near the crossing.

Upper Truckee River: (1) 100 meters upstream of the Pacific Crest Trail (PCT), (2) half way between the lower and upper PCT crossing, and (3) 500 m downstream from the lower PCT crossing.

Baldwin Allotment: (1) Tallac Creek at Lake Tahoe, (2) Tallac Creek at Highway 89, and (3) Tallac Creek upstream of beaver colonies (to isolate this source of background fecal coliform).

We also understand that the USFS will be putting an enclosure on Meiss Creek this year for the next five to ten years.

We hope this year's monitoring shows improvements. If not, USFS shall take aggressive steps to achieve compliance. We recommend, at a minimum off-stream watering of cattle, and rotating livestock between grazing areas on a more frequent basis. We expect these measures to be implemented this year. Pursuant to Section 13267 of the California Water Code, (CWC) you are required to implement the above monitoring and submit reports on the monitoring by October 1, 1999, November 30, 1999 (monitoring through October 30). Reports shall summarize data and recommend interim measures to be taken for the remainder of the grazing

season this year. The November report shall summarize all data and recommend plans to achieve compliance with water quality objectives in the future. Failure to submit the monitoring reports as requested may subject the USFS LTBMU to additional enforcement actions.

FUTURE VIOLATIONS

If additional remedial measures implemented this year do not result in achievement of water quality objectives, the USFS shall consider removal of livestock from the allotment, significant reductions of animal units allowed in the allotments, or exclusion of livestock from the entire length of stream.

FUTURE ENFORCEMENT ACTIONS

Since the USFS is the water quality management agency, I expect you to take actions to comply with the above water quality standards.

However, if the USFS is unwilling or unable to take corrective actions, I will recommend that the Regional Board consider adoption of Waste Discharge Requirements or Cease and Desist Orders to regulate discharges in the Meiss and Baldwin allotments.

Should you have any questions concerning this matter, please contact Lauri Kemper, Chief, Lake Tahoe Unit, at (530) 542-5436 or Dr. Bruce Warden at (530) 542-5416.

Sincerely,

HAROLD J. SINGER
EXECUTIVE OFFICER

FIGURE 6: DETERMINATION OF FECAL COLIFORM VIOLATIONS OF LAHONTAN BASIN PLAN WATER QUALITY OBJECTIVES

DATA REDUCTION PROCEDURE

(1) Water Quality Objective: from Log-normalized monthly data

(2) Water Quality Objective: from monthly data

If 10% or more of daily samples in a 30-day period are greater than 40 fecal coliforms per 100mL --> Violation

Note: Functionally this means that any single sample during the month above 40 fecal Coliforms/100 mL results in a violation, since there are seldom greater than 10 samples taken in a month's time period.

Note: When information of when livestock are on and off the allotment is available, periods before, during, and after livestock grazing are analyzed separately to better assess fecal coliform contamination from anthropogenic sources.
