

## Summary of Edits

A few minor edits have been made to the existing Field Data Sheets in order to reflect recent changes to the SOP. The following edits were made:

- Edits to **Flow Habitat Type Section:**
  - Description of **Riffles** had language removed that referred to coarse material. The language was changed from “*Shallow sections where the water flows over coarse stream bed particles that create mild to moderate surface turbulence; (< 0.5 m deep, > 0.3 m/s).*” to “*Shallow sections where the water flows over stream bed particles that create mild to moderate surface turbulence; (< 0.5 m deep, > 0.3 m/s).*”
  - Description of **Glides** had language removed that referred to flow. The language was changed from “*A section of stream with little or no turbulence, but faster velocity than pools; (< 0.5 m deep, < 0.3 m/s)*” to “*A section of stream with little or no turbulence; (< 0.5 m deep, < 0.3 m/s)*”.
- Edits to **Bank Stability Section:**
  - All transects had language edited to reflect new analysis; changing assessment from area to line. The language was changed from “*score zone 5m up and 5m downstream of transect between bankfull – wetted width*” to “*assess point of transect between wetted width and bankfull*”.
    - edits here were also made to the Electronic BA\_Field\_Form
- Two new rows were added in the **Notable Field Conditions Section:**
  - Site is affected by recent scouring event
  - Channel Engineered
- Three rows were removed from the first page to ensure that the transect information was together and reduce paper waste. The following rows were removed as the information was captured elsewhere in the document:
  - Collection Device
  - Calibration Dates
  - Field Measurement Notes
