Section 1

Scope and Applicability

This Standard Operating Procedure (SOP) describes inspection, testing, removal, and disposal requirements for materials containing polychlorinated biphenyls (PCBs) present in structures within the Caltrans right-of-way that will be demolished or rehabilitated. The intended users of the SOP are primarily Caltrans staff and contractors performing demolition or rehabilitation projects for Caltrans. This SOP fulfills PCB source control requirements for Caltrans stormwater discharges subject to the San Francisco Bay PCBs Total Maximum Daily Load (TMDL). Caltrans project managers would generally attach this SOP to a Project Environmental Assessment Report (PEAR) at the Project Initiation Document (PID) phase for any project in the San Francisco Bay Basin (Region 2) that drains to San Francisco Bay¹.

The TMDL addresses the problem of PCB concentrations in San Francisco Bay that exceed guidelines protective of human and ecological health. PCBs were used in certain types of building materials from 1950 to 1980. Consequently, demolition of certain structures poses a risk of releasing PCBs into urban streets and storm drain systems that ultimately drain to San Francisco Bay.

During the demolition of the Old East Span of the San Francisco Oakland Bay Bridge, Caltrans implemented a PCB inspection and removal plan at the direction of the San Francisco Regional Water Quality Control Board (Geocon 2013; Caltrans, 2013). As a result, about a cubic yard of caulk between roadway decks was pro-actively removed and segregated prior to removing the roadway decks (Figure 1-1). This action prevented material having PCBs from mixing with concrete rubble during demolition. This SOP builds on lessons learned from that experience and from guidance developed by Bay Area municipalities in compliance with the San Francisco Bay PCBs TMDL (BASMAA, 2018; BASMAA 2019).

The purpose of this SOP is to define a consistent approach to evaluating Caltrans projects to determine whether inspection and pro-active materials removal is needed to prevent the release of PCB-containing materials (priority materials) during demolition or other construction activities. This SOP is crafted to help:

- Readily identify and manage known priority materials, such as caulk
- Identify and manage other potential priority materials where they exist
- Efficiently rule out projects and facilities that do not need PCB inspections and identify priority materials that already have inspection and abatement requirements

This SOP is limited to structures within the Caltrans right-of-way and is designed to help efficiently screen out the expected majority of projects that will not require special provisions to address priority materials, and to establish a process that allows for tracking and reporting.

¹ Technically projects in watersheds that drain directly to the Pacific Ocean, e.g., along Highway 1, are not subject to the San Francisco Bay PCBs TMDL. The applicability of this SOP outside of the San Francisco Bay Basin would be determined either on a case-by-case basis or by Caltrans as a policy decision.

Figure 1-1. PCB-containing Caulk: PCB-containing caulk between road decks of the San Francisco Oakland Bay Bridge Old East span as discovered on inspection (left) and in a pile after removal (right), commingled with asphalt-concrete grindings.

1.1 Initial Screening: Do I Need to Perform a PCBs Assessment?

Every Caltrans project tributary to the San Francisco Bay will need to complete an initial screening to determine whether a PCBs assessment is needed. The screening consists of three simple questions at the PID Phase to determine if a project requires any further PCB assessments. This screening is modeled on the flowchart shown in Figure 1-2 and defined as follows:

- **Step 1 – Is it an applicable project?** Only projects involving demolition, reconstruction, rehabilitation, resurfacing, or otherwise disturbing existing structures need to perform PCB inspections per this SOP. Projects that consist solely of new construction need not implement this SOP; the respondent should review the project definitions of Section 1.2 of this SOP.
- **Step 2 – Does the project include applicable structures?** If the project includes the structures listed in Section 1.3, then further evaluation is needed.
- **Step 3 – Were parts of applicable structures constructed or modified before December 31, 1980?** PCB-containing materials were used in building construction until about 1980. If the structure was first constructed after 1980 there is no need for a PCBs inspection. If the structure was first constructed prior to 1981, then an initial screening for PCBs will be needed to determine this conclusion. If a conclusive determination cannot be made or it is evident that the structure or materials to be affected during the project have origins prior to 1981, then continue onto Step 4.
- **Step 4 –** At this juncture, the need for further assessment shall be documented in the PEAR and in the Stormwater Portal. The initial screening is complete and further assessment for potential PCBs is required to be conducted during the Project Approval/Environmental Document (PA/ED) phase as defined in Section 3.
- **Step 5 –** If a PCBs assessment is not needed beyond the initial screening by answering “No” to Steps 1, 2, or 3, then no further action is needed, document in the PEAR.

Figure 1-2. PCBs Screening Assessment

1.2 Applicable projects

The following are the type of Caltrans projects where one might encounter PCBs:

- **Decommissioning** – Decommissioning means removal from service, often but not always including deconstruction and/or demolition. For this SOP decommissioning projects are applicable if activities would mobilize priority materials listed in Section 1.4.
- **Deconstruction** – Deconstruction refers to removing a structure through careful dismantling to salvage parts for re-use or recycling.
- **Demolition** – Demolition refers to removal of a structure through more aggressive, abrupt means such as explosives, hoe-rams, wrecking balls, etc. Demolition is of interest in this SOP for purposes of segregating PCB-containing priority materials from construction waste generated by demolition.

1.2.1 Structural rehabilitation

Structural rehabilitation includes repair, retrofitting, and strengthening that improve structural performance and reduce vulnerability to earthquake, fire, corrosion, and normal use vibrations, and other degrading factors. Structural rehabilitation involves removal and replacement of unsound material and prevention of future degradation.

- **Resurfacing** – providing a new roadway surface on an existing pavement.
- **Restoration** – returning a road, structure, or collateral facility to the condition existing after original construction.
- **Rehabilitation** – consisting of structural enhancements that extend the service life of an existing pavement and/or improve its structural capacity.

1.3 Applicable structures

The following bullets include the structures that could potentially contain PCB materials.

- **Bridges** – A structure including supports erected over a depression or an obstruction, such as water, highway, or railway, and having a track or passageway for carrying traffic or other moving loads, and having an opening measured along the center of the roadway of more than 20 feet between copings of abutments or spring lines of arches. Bridges and elevated roadways are one focus area of this SOP because of lessons learned from assessments of PCBs in caulk from bridges (Appendix A; Caltrans 2013; BASMAA 2018). In the limited case studies cited the caulk was used in expansion joints.
- **Overpasses / underpasses** – A subset of bridge where the obstruction crossed by the overpass is another roadway, the underpass. As a type of bridge, expansion joint caulk would be at least one specific area of interest for PCB screening.
- **Elevated roadways** – A controlled-access highway that is raised above grade for its entire length. Elevation is usually constructed as viaducts, typically a long pier bridge. In essence, the entire elevated section of highway is a single bridge. As a type of bridge, expansion joint caulk would be at least one specific area of interest for PCB screening.
- **Ground level roadways** – Normal ground-level roadways may contain priority materials. Examples to look for include causeways or other roadways with expansion joints, and roadways over groundwater seepage. The presence of caulk in expansion joints may be determined from as-builts and / or visual inspection. Use of sealants to prevent seepage

may have occurred in areas where rising groundwater can enter the roadway (e.g., City of Tacoma, 2013). Risk factors to evaluate include when the roadway was constructed and / or last resurfaced, whether the project designs indicate high groundwater levels, and whether cracks in roadways have been treated or repaired with sealant prior to 1980.

- **Toll booth facilities** – Toll booth facilities include roadways and approach lanes, toll booths and automated vehicle scanning areas, administrative and maintenance buildings, access tunnels and walkways, overhead signs, and catwalks, In addition to evaluations for potential caulk and sealants described for bridges and roadways above, caulk may be present in the windows and door frames of buildings.
- **Operation and maintenance facilities** – Operation and maintenance facilities will include buildings that should be assessed for potential to contain caulk in windows and door frames placed prior to 1980. These facilities may include materials storage areas, workshops, garages, and other similar areas. Storage and workshop areas should be assessed for legacy stored priority materials, such as sealants and mastic.
- **Pump station facilities** – Pump station facilities may include a building that has doors or windows that contain caulk. Lubricants and hydraulic fluids related to pumps are potential priority materials. Reviewing as-builts and maintenance records and inspecting the pump station will help determine if caulks or sealants were used at the facility.
- **Tunnel and appurtenant facilities** – Tunnels and appurtenant facilities includes the tunnel roadway and inner shell, access space and walkways outside the inner shell, ventilation structures, and maintenance buildings. Roadways should be assessed for expansion joints and cracks with sealant applied. Access spaces, ventilation structures, and maintenance buildings should be assessed for insulation, caulk and sealant. Adhesive applied to tunnel tiles, known as mastic, is a potential priority material. A record of the last major tile replacement or installation would help verify whether mastic behind tiles was placed prior to 1980, which would require sampling and analysis.
- **Electrical substations** – Electrical substations owned by Caltrans may have priority materials including transformers, capacitors, and insulated wire. If special provisions already address inspecting and removing such materials, they are exempted from this SOP. Electrical substation buildings should be assessed for caulk and sealant per other structures described in this SOP.
- **Airspace lease facilities** – Locations that modify Caltrans facilities to accommodate airspace leases would be inspected per guidance appropriate to the Caltrans facility types as described above. Any structure related to the business or operation leasing the Caltrans airspace would be inspected and reported as an applicable structure.

1.3.1 Exempted projects

There are two types of projects that are to be excluded from this SOP. The two exclusions are for:

- Projects involving Caltrans San Francisco Bay Area buildings that are strictly for office and administrative purposes. These projects would implement municipal PCBs building demolition program via the local agency building permit application process (BASMA, 2019).
- Projects involving CALTRAIN facilities. These projects are the responsibility of the Peninsula Corridor Joint Powers Board.

1.4 Priority PCB-containing materials

Classifying PCB-containing materials by the application type focuses materials assessments. Open applications are uses of PCBs in material not enclosed in a container, vessel, housing, or other manner. Open applications are the primary focus of this SOP, because most closed PCB applications already have pre-defined inspection, removal, and disposal requirements.

1.4.1 Open applications

1.4.1.1 Caulk and joint sealant

The difference between caulk and sealant is primarily elasticity. Caulk tends to be more rigid while sealant is more elastic. This section refers to caulk and sealant placed in open applications. Studies of PCBs in urban infrastructure have identified some locations where caulk placed between expansion joints of bridges and elevated road decks had elevated PCB concentrations (Appendix A, Caltrans 2013; BASMAA, 2018; City of Tacoma, 2013). In those studies, a feature common to the limited set of infrastructure materials sampled was that the caulks and sealants having high PCB concentrations were all colored dark grey to black.

1.4.1.2 Floor and area sealant

Waterproofing sealant applications also come in liquid forms that can be poured or painted onto treated surfaces. If such materials were applied prior to 1980 they may have elevated PCBs. Inspect floors and surfaces vulnerable to water seepage and moisture for evidence of sealant applied, and review as-builts and maintenance records to determine if sealants were used.

1.4.2 Semi-closed applications

1.4.2.1 Adhesives and mastics

Reflective pavement striping and markers is one of the most common uses of adhesive. If pavement striping removal, segregation and disposal is covered under special provisions the associated adhesive is excluded from this SOP. Adhesives applied to carpet and other floor covering in older buildings may be a priority material if installed before 1980. Mastics used to hold tiles in place – in tunnel ceilings, for example – are potential priority materials if placed before 1980.

1.4.2.2 Internal lubricants

Internal lubricants for specialized applications may be priority materials. Two possible examples include hydraulic seismic dampeners on bridges and lubricants in the motors of travelers used to service bridges. If special provisions already address inspection and disposal of lubricants from these or similar components, they are excluded from this SOP.

1.4.3 Closed applications

The following closed applications are excluded from this SOP if the project standard and special provisions requires assessment and proper disposal:

- Capacitors
- Electric circuit boards
- Ballasts
- Circuit breakers
- Electrical insulation

Section 2

Summary of Priority Materials Assessment Method

This Section provides a summary of the Steps shown in the flowchart of Figure 2-1 that should be accomplished after reaching Step 4 of the Initial Screening described in Section 1.1. The Project Development Team should complete Steps 6, 7, and 8 for the preferred and selected alternatives defined in the project's environmental document, whereas Steps 9 through 13 would be completed during construction by the Contractor and reported by the Resident Engineer.

2.1 Project Activities – PA/ED Phase

- **Step 6 – Does the project potentially contain priority materials that may be disturbed or removed?** During the PA/ED phase, the Project Development Team should revisit the documentation from the PEAR and, if possible, identify portions of the project that may contain PCBs to determine or affirm the presence of these materials within the project area and scope. The answer to this question may require sampling or researching material composition; however, if safe access for sampling is not possible or uncertain identification remain, then answer “Yes” and move onto Step 7. The materials should be identified in the water quality assessment report (WQAR) or another equivalent document.
- Inspectors should look for joints and connections sealed by caulk, insulated areas, equipment such as transformers, capacitors, and other priority materials listed in Section 1.4.
 - Integrity of caulk, adhesives, insulation, cable housing and other priority materials should be observed and documented during site visits.
 - Signs of flaking, crumbling, erosion, or other mobilization of material known or suspected to contain PCBs should be photographed.
 - Photographs of priority PCB-containing materials should include clear indications of location and scale, date sampled.
- **Step 7 – Will all priority materials be inspected and abated through other requirements?** Closed application priority materials such as light ballasts and transformers are materials that can addressed through existing Caltrans specifications. If these materials are the only priority materials identified from Step 6, then the Project Engineer shall ensure the appropriate specifications are included in the plans, specifications, and estimate (PS&E) package. If other priority materials exist within the project and cannot be abated or removed prior to completion of the PS&E phase, then answer “No” to this Step and describe the materials in the environmental document along with the proposed mitigative effort. These other materials should be identified in the plans with accompanying specifications to accomplish Steps 9 through 13.
- **Step 8 – Document that a PCBs assessment has been completed without a finding of priority materials other than closed applications, as appropriate.**

2.2 Project Activities - Construction

- **Step 9 – Develop and Execute a PCB Inspection Plan for priority materials.** The specifications shall direct the construction contractor to conduct further evaluation of the priority materials to make determination by a properly credentialed entity, this should take place if the evaluation has not been completed earlier. The inspection plan to be submitted for review and approval of the Resident Engineer should describe the contractor's actions to be taken for determining the amount of material to be removed; sampling and analysis techniques (see Appendix B); qualified laboratories to be used; methods of handling and disposal to prevent loss of material and site surface contamination; disposal facilities for each material source; and protection measures installed to prevent materials from becoming present or conveyed into drainage systems and surface waters.
- **Step 10 – Do representative sample results or records show PCB concentrations above 50mg/Kg in priority materials?** Test results should be used to perform a hazardous waste assessment on the materials in comparison to the trigger value of 50 mg/kg defined in the Toxic Substances Control Act (TSCA) for classifying construction materials as hazardous. The hazardous waste assessment should rely on a statistical determination of the characteristic PCB concentration of the priority materials, e.g., the 90 percent upper confidence interval of the mean or another statistically defensible approach consistent with the guidance of SW-846. If priority materials having PCB concentrations that exceed 50 mg/kg are identified, then proceed to Steps 11 and 12 for removal of those materials. Report priority materials with concentrations below 50 mg/kg, as well as non-detects (reporting the actual detection limit achieved by the laboratory), and proceed to step 13.
- **Step 11 – Follow applicable Federal and State guidelines for notification and abatement.** Procedures required by Federal and State regulations must be followed. Depending on the magnitude of the material to be removed and its proximity to receiving waters, the RWQCB may need to be informed regarding the final handling and reporting of the materials; this commitment should be defined in the project's environmental document and notification procedures made part of the specifications for the project. Materials for disposal may be placed at a facility permitted to accept such materials provided that the RWQCB has not requested placement at a specific class of facility, which should be defined in the specifications.
- **Step 12 – (Material exceeds 50 mg/kg) Document in the Stormwater Portal and Project files** – Materials are to be disposed of as hazardous waste. The removal of the PCB containing materials shall be documented in the project files. The documentation is to include information regarding the quantity of material, and concentrations of PCBs per US EPA manifest or similar documentation. The mass of PCBs removed will be calculated by Caltrans and included as part of Caltrans' annual reporting on TMDL compliance.
 - Documentation at this step would be in conformance with
 - Caltrans Standard Specifications Section 14-11 (Hazardous Waste and Contamination)
 - The Caltrans Construction Manual Section 7-107 (Hazardous Waste and Contamination)
- **Step 13 – Document in the Stormwater Portal and Project files**– Materials are to be removed and disposed or re-used as non-hazardous waste. Information regarding the quantity of material, concentrations of PCBs, and calculation of load(s) removed shall be identified in the contract specifications and documented in project files. This information

shall be utilized as part of Caltrans' annual reporting on TMDL compliance. If PCBs were detected, the mass of PCBs removed will be calculated by Caltrans and included as part of Caltrans' annual reporting on TMDL compliance.

- Documentation at this step would be in conformance with:
 - Caltrans Standard Specifications Section 13-4.03C (materials management on construction sites)
 - Caltrans Construction Manual Section 7-109 (solid waste disposal and re-use reporting requirements, including form CEM-4401)
 - Caltrans Standard Specifications Section 14-10 (management of non-hazardous solid waste)

Figure 2-1. PCB Priority Materials Inspection and Assessment

Section 3

Review and Preparation

Background document review and preparation sets the stage for PCB inspections.

3.1 Review background documents

Background document review helps develop the inventory of potential PCB sources. Background documents likely to provide helpful information include project plans, site maps, site photographs, and historical as-builts and construction records. The purpose of the background document review is to identify applicable structures (Section 1.3) in the project area that may have priority materials (Section 1.4).

3.2 Visual inspection

visual inspection should be completed to determine:

- whether priority material need to be sampled
- where the material is located
- how many samples need to be collected

3.2.1 Sampling Considerations

- For a complex site with extensive placements of caulk, adhesive mastic, insulation, or other material that needs to be sampled the site visit is an important part of the sampling design.
- Representative sampling requires a minimum number of samples, depending on the linear feet, square feet, or volume of material to be sampled (See Appendix B for guidance).
- An initial site visit is needed to make preliminary estimates of the sampling effort and inform the development of a Sampling and Analysis Plan.

3.3 Develop suspect PCB source inventory

Based on the document review completed and the visual inspections completed as outline above, prepare an inventory of priority material describing the material type, locations that will be inspected, and amounts (length, area, or volume as appropriate to the material). Include a map identifying locations of priority materials to be sampled.

3.4 Prepare Field Worker Health and Safety Plan

A field health and safety plan should address general access and sampling safety considerations related to Caltrans facilities and issues specific to PCB investigations. Activities involving health and safety risks would need to be addressed through field health and safety plans, daily tailgates, and other appropriate training and documentation. This section presents a summary of risks common to many site assessments, but it is not an exhaustive list of risks. Specific site health and safety plans will need to address unique site conditions.

Topics likely to be addressed include but are not limited to:

- Site access and security
- Traffic controls
- Confined space entry
- Worker exposure to dust, lead, asbestos, PCBs and other legacy pollutants
- Working at heights

Section 4

Sampling and Comparison to Threshold

This section outlines the process for sampling and comparison to thresholds.

4.1 Sampling and analysis plan (SAP)

Prepare a SAP following the template provided in Appendix B.

4.2 Collect and analyze samples according to SAP

- Collect samples following the SAP.
- Note any deviations from procedures defined in the SAP.
- Submit samples to the laboratory for analysis.
- Review results for conformance to DQOs.
- For any non-conformance to DQOs, identify root causes where possible and note the impact of the non-conformance on the usability of the data for comparison to thresholds.

4.3 Perform statistical analysis on results

- If replicate samples were collected calculate the 90% upper confidence limit of the mean total PCB concentration from all replicates.
- Contractors may propose alternate statistical assessment methods with justification (e.g., based on EPA 2002).
- If only a single sample was collected use the single sample result.

4.4 Compare assessment results to 50 mg/kg TSCA trigger

- If the 90% upper confidence limit of sample results (or the single sample result if only one replicate was measured) exceeds 50 mg/kg, then the material tested exceeds the TSCA trigger for classification as hazardous waste.

4.5 Make re-use and disposal decisions based on findings

- If PCBs in the material exceeds 50 mg/kg, the contractor is required to follow the Caltrans Standard Specifications, Section 14-11, and the Caltrans Construction Manual, Section 7-107 for procedures for disposal of hazardous waste.
 - The most recent guidance as of this SOP is the 2023 edition of Caltrans Standard Specifications, available at:
https://dot.ca.gov/-/media/dot-media/programs/design/documents/2023_stdspecs-a11y.pdf
(last accessed 1/26/2024)
 - Use the most recent version of the Caltrans Standard Specifications available.
 - The Caltrans Construction Manual is available at:
<https://dot.ca.gov/programs/construction/construction-manual>

(last accessed 1/24/2024)

- Include yellow 6 x 6-inch labels with a “Caution contain PCBs” on stored materials, consistent with federal agency guidelines
- See <https://www.fws.gov/policy-library/e1561fw9> for an example of caution labels
- If PCBs in the material does not exceed the 50 mg/kg TSCA trigger, but PCBs are detected in the material, Caltrans will report the results to the Regional Water Quality Control Board (Water Board) staff responsible for approval of the Stormwater Pollution Prevention Plan and request a response within 10 (ten) business days as to whether special segregation or disposal of the material is requested by Water Board.
- If PCBs were not detected in material, or if Water Board does not respond within 10 business days, the contractor is required to follow Caltrans Standard Specifications and guidance in the Caltrans Construction Manual related to solid waste disposal and re-use:
 - Section 13-4.03 of the Caltrans Standard Specifications directs materials management on construction sites.
 - Section 7-109 of the Caltrans Construction Manual establishes solid waste disposal and re-use reporting requirements. Form CEM-4401 specified in this section provides a mechanism for documenting and tracking disposal and re-use of materials.
 - Section 14-10 of the Caltrans Standard Specifications directs procedures to contain and manage non-hazardous solid waste intended for re-use or disposal.

Section 5

Caltrans Tracking and Reporting

This SOP implements actions that show Caltrans's compliance with the San Francisco Bay PCBs TMDL. Documenting actions and outcomes helps Caltrans evaluate attainment of Caltrans' PCBs wasteload allocation.

5.1 Effectiveness Evaluation Questions

There are three broad questions asked of Caltrans through effectiveness evaluation of this SOP as a Best Management Practice for PCBs controls:

- Is the SOP being consistently applied, i.e. are all Caltrans projects in the San Francisco Bay watershed following this SOP, at least do determine if they are applicable?
- What are the outcomes, i.e., for all projects screened by this SOP how many reach each of the four possible endpoints in Figures 1-2 and 2-1:
 - Screened out because not an applicable project or structure (Step 4, Figure 1-2)
 - All priority materials covered by existing requirements (Step 8, Figure 2-1)
 - Inspected, found priority materials exceeding 50 mg/kg, reported and abated (Step 12, Figure 2-1)
 - Inspected, found no priority materials exceeding 50 mg/kg (Step 13, Figure 2-1)
- What are the outcomes, in terms of PCB loads avoided?
 - This information would be determined from PCB inspection reports with detected PCB concentrations where specific actions were taken to abate priority materials.

5.2 Stormwater Portal Updates for PCB SOP Implementation Tracking

To track the first two programmatic effectiveness questions, consistency and endpoints reached, the Portal needs to be updated with two new fields:

1. PCB Screening Performed?
 - a. yes / no field
 - b. If no is selected a "please explain" text field should pop up
 - c. This field should essentially always be a yes going forward
2. Outcome?
 - a. List with one of four possible outcomes
 - i. Not applicable project/structure
 - ii. All priority materials covered by other requirements
 - iii. Inspected, reported and abated priority materials >50 mg/kg
 - iv. Inspected, no priority materials > 50mg/kg
 - b. Selecting outcome iii or outcome iv triggers report upload fields
3. Inspection Plan
 - a. Upload field
 - b. Triggered if outcome iii or iv selected above

4. Inspection Report
 - a. Upload field
 - b. Triggered if outcome iii or iv selected above
5. Abatement actions
 - a. Upload field
 - b. Triggered if outcome iii selected above
6. PCB Mass abated
 - a. Numeric field (grams)
 - b. Triggered if outcome iii selected above
 - c. Can be left empty until annual TMDL Compliance Report completed

5.3 Annual Reporting

Caltrans' annual TMDL compliance report would use the information uploaded to the Stormwater Portal as follows:

- Numeric outcomes

This would be a simple table summing for the year and as a running total:

- Number of new projects /number screened (should be equal)
- Number of projects reaching each of four possible outcomes

Caltrans Division of Environmental Analysis (DEA) may consider whether to screen existing projects that have completed the planning and design phase but have not yet gone to construction. If so, the priority would be on bridges, elevated roadways, and other structures with expansion joints that may have caulk as a construction material.

5.4 Computation of PCB mass abated

Completed projects with abatement reports would be reviewed to estimate the PCB mass abated. The review of all completed projects would be performed once annually for all projects that have not yet had the calculation completed. The PCB mass abated would be estimated based on the estimated mass of priority material abated multiplied by PCB concentrations of the material. Enter results in the "PCB Mass Abated" field of the project's profile in the Stormwater Portal.

Appendix A: References and Case Studies

1. Guidance for Municipalities per the San Francisco Bay PCBs TMDL

Bay Area Stormwater Management Agencies Association (BASMAA), 2019. Protocol for Evaluating Priority PCBs-Containing Materials before Building Demolition. Prepared by EOA, Inc., Larry Walker Associates, Geosyntec Consultants, Stephanie Hughes, and David J. Powers & Associates, Inc. November 2019. Available at: <https://basmaa.org/wp-content/uploads/2021/01/applicant-pkg-pcbs-demo-revised-11-7-2019.pdf>, last accessed 4/17/2023.

Notes on use of BASMAA (2019) in this Caltrans SOP: This Caltrans SOP aligns with the referenced BASMAA inspection and reporting guidance developed by municipalities for implementing waste load allocations assigned to municipal stormwater dischargers, including Caltrans, under the San Francisco Bay PCBs TMDL. The BASMAA guidance was developed through a stakeholder process that included construction and demolition industry representatives, USEPA, and San Francisco Bay Water Board staff.

Caltrans guidance will be based on similar concepts and rely on a parallel approach adapted to the Caltrans right-of-way context. For example, the screening out process for surface reflector (Bott's Dots) adhesives should put the reflectors and attached adhesive into the "already has a materials collection containment and disposition plan" category, consistent with the San Francisco Oakland Bay Bridge case study approach. Need to analyze and discuss whether there are other obvious carve-outs based on lessons learned, e.g., perhaps no need to direct Caltrans SOP users to keep testing paints for PCBs as was done at SFOBB.

BASMAA, 2018. Evaluation of PCBs in Caulk and Sealants in Public Roadway and Storm Drain Infrastructure. EOA, Inc., Kinnetic Labs Inc., and the San Francisco Estuary Institute, Final Project Report, August 2018. Available at: https://basmaa.org/wp-content/uploads/2021/04/final-pcbs-in-infrastructure-caulk-project-report_august-2018.pdf, last accessed 4/17/2023.

Notes on use of BASMAA (2018) in this Caltrans SOP: The BASMAA study of PCBs in caulks and sealants was a collaborative project by municipal stormwater programs fulfilling a requirement of the Municipal Regional Stormwater NPDES Permit. The study presented results of 20 different composite samples of caulks, sealants, and adhesives from Bay Area roads, bridges, and storm drain infrastructure. The findings are helpful in showing specific examples of caulk tested and where it was and was not found.

2. Lessons Learned from the San Francisco Oakland Bay Bridge Demolition

Geocon, 2013. Polychlorinated Biphenyl Survey Plan San Francisco-Oakland Bay Bridge Eastern Cantilever/Truss Span Oakland, California Contract No. 04A3954, EA No. 04-0120T4. October 18, 2013, Memorandum from David Watts and Richard Day (Geocon) to Dragomir Bogdanić (Caltrans).

Caltrans, 2013. "SFOBBB PBC Survey," November 20, 2013, email report from Hardeep Takhar (Caltrans) to Derek Beauduy (San Francisco Bay Regional Water Quality Control Board).

Amec Foster Wheeler, 2015. "SFOBB PCC Bumper," July 10, 2015, email Report from Brad Dickson (Amec Foster Wheeler) to Khalil Abusaba (Amec Foster Wheeler).

Notes on use of Geocon (2013), Caltrans (2013), and Amec Foster Wheeler (2015) in this Caltrans SOP: The survey plan from Geocon, the email report to Water Board, and the internal consultant email report contain concise information on the inspection approach, findings, and amounts of PCB-containing caulk removed from the San Francisco Oakland Bay Bridge prior to demolition of the concrete slabs of the superstructure.

3. Lessons Learned from Contra Costa County Bridge Inspections

NCE, 2018. Limited Phase II Environmental Site Assessment Investigation Marsh Creek Road Bridge Replacement Project Contra Costa County, CA. February 6, 2018, report submitted to Laura Cremin (Contra Costa County Public Works) by Michael Leacox (NCE).

Fugro, 2014. Final - Phase II Environmental Site Assessment, Orwood Road Bridge Replacement Project Contra Costa County, California. January 2014 Report submitted to Jack Gough (TY Lin Co. on Behalf of Contra Costa County Public Works) by Jeriann Alexander (Fugro).

Notes on use of NCE (2018) and Fugro (2014) in this Caltrans SOP: These two case studies represent "negative" end points, i.e., it is possible to inspect for PCB containing caulk and not find it. NCE (2018) report inspectors found no suspect material. Fugro (2014) reports rubber sealant between decks tested for PCBs, non-detect by EPA method 8082.

4. General References

United States Environmental Protection Agency, 2002. Calculating Upper Confidence Limits for Exposure Point Concentrations At Hazardous Waste Sites. OSWER 9285.6-10, December 2002, <https://www.epa.gov/sites/default/files/2016-03/documents/upper-conf-limits.pdf>, last accessed 5/31/2023

Appendix B: Sampling and Analysis Plan Guidance

Elements of a PCBs Sampling and Analysis Plan

The following are the components that should be included in the SAP

Project background and location (including map)

Detail project map showing priority materials and sampling locations

Sample frequency rationale

The SAP should describe the number of samples to be collected from each type of priority material:

1. Caulk

Treat window caulk, door frame caulk, and floor / expansion joint caulk from buildings each as a unique priority material for purposes of sampling. Likewise, treat expansion joint caulk from bridges and elevated roadways as a priority material distinct from building caulks. For each type of caulk identified, collect samples at the following frequencies based on linear feet available to sample:

- One sample from each homogenous area² totaling 50 linear feet or less
- Three samples from each homogenous area totaling more than 50 and less than 250 linear feet
- Five samples from each homogenous area totaling 250 to 1,000 linear feet
- Seven samples from each homogenous area totaling 1,000 to 2,500 linear feet
- Nine samples each homogenous area totaling exceeding 2,500 linear feet

Window and door frame caulk encountered in the execution of this SOP would likely be in small areas, such as access portals to bridges, tunnels, and other structures. If so, these materials would need to be assessed for PCBs to determine if they are priority materials. Based on prior lessons learned, caulk in roadway expansion joints from bridges and overpasses are known uses that may contain PCBs.

2. Adhesives and mastics

For each type of adhesive or mastic identified as a potential priority material collect samples at the following frequencies:

- Collect at least three samples from each homogenous area less than 1,000 square feet.
- Collect at least five samples from each homogenous area between 1,000 and 5,000 square feet.
- Collect at least seven samples from each homogenous area greater than 5,000 square feet.

3. Sealants

Sealants are more elastic formulations of caulk that can either be applied as a bead along a linear joint or poured / painted onto surfaces for less viscous formulations.

- For linear sealant one to nine samples should be collected depending on the total application length, comparable to caulk.
- For surface sealant applications one to seven samples should be collected depending on the total application area, comparable to adhesives.

² For this SOP homogeneous areas of priority material are areas with similar application and appearance, e.g., "greyish-black, brittle caulk placed between road deck expansion joints." The areas need not be continuous to be considered and sampled as a single homogeneous area.

4. Rubber window seals / gaskets

Collect one to nine samples depending on the total application length, comparable to caulk.

5. Lubricants

Lubricants in partly closed or closed applications such as traveler motors and hydraulic stabilization pistons should be sampled once per device.

6. Thermal / fiberglass Insulation

Collect at least one bulk sample from each homogeneous area.

Sampling equipment

- Place building materials collected for laboratory analysis in laboratory-supplied glass jars with Teflon-sealed lids following procedures established in USEPA Method 8082 / 8082A.
- Collect samples with either factory-sealed or decontaminated equipment that will be used to remove a representative building material sample (i.e., scissors, tweezers, pliers, spoons, or putty knife).
- Decontaminate sampling equipment (i.e., scissors, tweezers, pliers, spoons, putty knife, etc.) using the following three bucket wash procedure (USEPA, 2015; BASMAA 2018):
- In the first bucket, mix a residue free cleaning detergent (e.g., Alconox®), with distilled water to generate the recommended detergent concentration specified in the product directions;
- Fill the second and third buckets with distilled water;
- Clean the equipment in the first bucket with the cleaning detergent, then rinse in the second and then the third bucket.
- If the second bucket becomes slightly discolored during the rinse, change the contents of the second bucket with distilled water.
- The third bucket is the final rinse and therefore needs to stay clean. Change the third bucket if any dirt or material is observed in the water.
- At the end of cleaning, air dry equipment in a clean area before use in sample collection. Drum and sample rinse water for disposal.
- The planned disposal facility should be contacted to determine the required sample analysis for the rinse water characterization and profiling and that the disposal procedures comply with state and federal regulations.
- If disposable sampling tools are used, the above decontamination procedures do not apply.
- Additionally, decontamination with certain solvents (e.g., hexane) may be utilized for cleaning of tar-like substances, followed with the standard decontamination procedures listed above.
- Air drying is equipment is recommended. If time constraints preclude air-drying alternative drying means may be considered (e.g., wiping dry with a low-lint absorbent disposable wipe).

Sample collection

- Distribute samples across representative subsections of homogeneous areas of priority materials
- Use new or decontaminated sampling equipment on each location

Sample preservation

- Chill samples and maintain between 0 and 6 degrees Celsius (32- and 42.8-degrees Fahrenheit) during storage and transportation to the laboratory following procedures established in USEPA Method 8082/8082A.
- Follow proper chain-of-custody from the time the samples are collected until they are delivered to the laboratory for analysis.
- Holding times for EPA Method 8082/8082A are sample extraction within 14 days of sample collection and analysis of the extract within 40 days of extraction.
- However, PCBs are very stable in a variety of matrices and holding times prior to extraction may be extended to as long as one year. This can be helpful if laboratory capacity is limited.

Chemical analysis

- Analyze priority materials samples for total Aroclors³ by EPA Method 8082/8082A4 using an accredited analytical laboratory.
- The reporting limit goal should be 500 micrograms per kilogram ($\mu\text{g}/\text{kg}$) = 0.5 mg/kg⁵.
- Contact the laboratory when preparing the SAP to confirm that it can meet the reporting limit objectives.

Quality assurance and quality control

The SAP should include a Quality Assurance / quality control (QA/QC) section that specifies the following quality control checks:

- Proper specified sampling equipment was used (pre-cleaned or other, stainless steel)
- Proper decontamination procedures were followed
- Samples were collected per the frequencies prescribed in this SOP
- A National Environmental Laboratory Accreditation Program (NELAP) laboratory or a California-ELAP (CA-ELAP) was utilized
- Samples were received by the laboratory within the proper temperature range
- Samples were extracted and analyzed within the method holding time for EPA Method 8082/8082A and Analytical met data quality objectives (DQOs)
- Detection limits
- Accuracy based on matrix spike recovery
- Precision based on duplicates / matrix spike duplicates

Laboratory qualifications

- The laboratory used must have National Environmental Laboratory (NELAP) laboratory and California-ELAP (CA-ELAP) accreditation.
- The laboratory must be capable of analyzing solid samples by EPA Method 8082/8082A with a reporting limit of 500 $\mu\text{g}/\text{kg}$ (= 0.5 mg/kg).

³ Aroclor is a PCB mixture produced from approximately 1930 to 1979. It is one of the most known trade names for PCB mixtures.

⁴ The goal of this SOP is to identify and manage priority materials with PCBs concentrations of 50 mg/kg or more. EPA Method 8082/8082A is an acceptable method to quantify PCBs at 50 mg/kg.

⁵ The reporting limit can be modified to account for necessary dilutions or interferences, as determined by the laboratory. This reporting limit of 599, which is below the target management level of 50 mg/kg, is typically requested by the San Francisco Bay Regional Water Quality Control Board to gather additional data on the concentration of PCBs in priority materials.

EXECUTIVE SUMMARY

This memorandum summarizes the California Department of Transportation's (Caltrans) compliance plan for the Los Peñasquitos Lagoon Sediment Total Maximum Daily Load (Sediment TMDL).

Background

The Sediment TMDL, adopted in 2012, addresses lost salt marsh habitat and related beneficial of Los Peñasquitos Lagoon (Lagoon). Sediments discharged from stormwater runoff and other processes related to urban development are impairing the Lagoon. The goal of the Sediment TMDL is to reduce annual sediment loads from all watershed sediment sources by 5,139 tons per year. Caltrans is responsible for a little less than 1 percent (48 tons per year) of the total watershed sediment load reduction.

Historically, the Lagoon had 420 acres of salt marsh habitat, based on mid-1970s data when Lagoon conditions supported water quality standards. The Sediment TMDL allows alternative compliance with waste load allocations (WLAs) through Lagoon restoration projects that lead to achievement of the Lagoon final numeric target of 346 acres of restored salt marsh habitat by 2034. Caltrans has financially participated in Lagoon restoration but has prioritized BMPs to reduce watershed loads as a clear path to compliance.

Purpose

The purpose of this memorandum is to summarize actions implemented by Caltrans that comply with Sediment TMDL WLAs to achieve its 48 tons per year watershed sediment load reduction goal through BMPs implemented in the watershed. The memorandum also translates Lagoon restoration activities into mass of sediment removed from the Lagoon to quantify the benefit of financial contributions Caltrans has made above and beyond minimum watershed load reduction requirements.

Findings

Caltrans' proactive compliance with the Sediment TMDL exceeds the watershed load reduction goal of 48 tons per year. Caltrans' strategy of implementing BMPs across its property combined with partnerships to implement BMPs treating non-Caltrans lands is responsible for reducing watershed sediment loads by at least 90 tons of sediment per year. In addition to the 90-ton annual reduction, ongoing channel maintenance efforts funded in perpetuity by Caltrans provide added sediment removal benefits.

Financial contributions to a Lagoon restoration project led by City of San Diego provide tangible benefits in terms of sediments removed by excavation: at least 20,000 tons and as much as 100,000 tons removed compared with the annual watershed load reduction goal of 5,139 tons. Should Lagoon restoration proceed, Caltrans committed

approximately \$2 million of State Highway Operation and Protection Program (SHOPP) funds in April 2021, with associated project management and coordination, to be available once the City of San Diego-led restoration project is ready for construction. The funding represents approximately 5.7 percent of the estimated \$35 million Lagoon Restoration project cost as of April 2021.

A summary of sediment load reductions indicates Caltrans' load reduction goal has already been achieved and exceeded by a factor of three. Completion of Lagoon restoration and crediting Caltrans' contribution would increase this to a four-fold overachievement of the watershed load reduction goal (Table ES-1).

Table ES-1. Summary of Caltrans Sediment Load Reductions Compared to Goals

Source	Sediment Load Reduction (Tons / Year)
Watershed Load Reduction	5,139
Caltrans share of watershed load reduction	48
BMPs funded by Caltrans on Caltrans Lands	27
BMPs funded by Caltrans on non-Caltrans Lands	63
Channel Maintenance ¹	~48
Lagoon Restoration ²	>48
Factor by which Caltrans has exceeded its load reduction goal = 4-fold	

Notes:

- 1) Disposal records for maintenance dredging are not readily available but 2-3 truckloads per year is a reasonable estimate for the activity, which is about 48 tons per year of sediment.
- 2) Lagoon restoration concepts estimate up to 100,000 tons of sediment removed by the activity. Caltrans 5.7 percent share of credit for funding the activity would amount to 5,700 tons of sediment removed, equal to compliance with its 48-ton load reduction goal for more than 100 years.

Recommendations

Caltrans recommends that the San Diego Regional Water Quality Control Board (SDRWQCB) communicate a response to this memorandum confirming that Caltrans has achieved its TMDL WLA for the Los Peñasquitos Watershed.

In lieu of implementing an individual monitoring program of stormwater discharges from Caltrans ROW and treatment facilities, Caltrans agrees to voluntarily collaborate and participate in stakeholder-led monitoring of the Lagoon and the watershed. Caltrans believes that participation in the stakeholder-led monitoring program is the best use of resources and provides meaningful data to address watershed-based WLAs.

1.0 BACKGROUND

Los Peñasquitos Lagoon (Lagoon) connects the west-central San Diego County sub watersheds of Los Peñasquitos Creek, Carroll Canyon Creek, and Carmel Creek to the Pacific Ocean (Figure 1-1). Excessive sediment accumulation impairs habitat beneficial uses of the Lagoon by degrading and altering historical tidal and nontidal salt marsh habitat (San Diego Regional Water Quality Control Board [SDRWQCB], 2012A, 2012B). The Sediment Total Maximum Daily Load (TMDL) for Los Peñasquitos Lagoon (Sediment TMDL) requires reduction of watershed sediment loads to 1973 levels to achieve the numeric target of restoring 346 acres of salt marsh habitat acres, approximately 80 percent of the original 420 acres of historical salt marsh habitat.

The Sediment TMDL names the California Department of Transportation (Caltrans) as one of several stormwater dischargers permitted under the National Pollutant Discharge Elimination System (NPDES), along with municipal stormwater dischargers (City of Del Mar; City of Poway; City of San Diego; County of San Diego) and other watershed stakeholders subject to NPDES general permits. The City of San Diego led Sediment TMDL development, with financial contributions from Caltrans and other parties named as responsible for sediment load reductions in the Sediment TMDL.

Responsible parties named in the Sediment TMDL are collectively required to take actions to reduce watershed sediment loads from the current (as of year 2000) estimated levels of approximately 7,700 tons per year to 2,600 tons per year, i.e., approximately a 67 percent reduction. The Sediment TMDL also allows for compliance by leading or contributing to projects that restore the Lagoon and increase amounts of salt marsh habitat toward the TMDL numeric target of 346 acres.

This technical memorandum summarizes the following:

- Brief background on the Sediment TMDL as it relates to compliance analysis
- Quantification of the benefits of Caltrans actions to reduce sediment loads in the Los Peñasquitos watershed
- Caltrans financial contributions to lagoon restoration
- Quantification of sediment removal benefits of Lagoon restoration
- Caltrans compliance with the Sediment TMDL

1.1 Los Peñasquitos Lagoon and Watershed Description

The Lagoon resides within Torrey Pines State Natural Reserve. California Department of Parks and Recreation (State Parks) has assigned the Lagoon the status of Natural Preserve because it represents one of the few remaining southern California native salt marsh

lagoons. The ecologically diverse habitat supports a variety of plants and animals, including sensitive plant and wildlife species.

Open space comprises approximately 43 percent of the 60,000-acre watershed draining to the Lagoon, and urbanized areas occupy approximately 53 percent. The remaining 4 percent is distributed among park, agricultural, and recreation land uses. Urbanized areas include all developed lands, including Caltrans facilities. Major highways include the north-south Interstate Routes 5, 805, and 15, and the east-west connecting State Route 56¹.

1.2 Basis and Causes of Impairment

The Water Quality Control Plan for the San Diego Basin (Basin Plan) Amendment for the Los Peñasquitos Lagoon Sediment TMDL (SDRWQCB, 2012A) states that habitat changes in the Lagoon have impaired the specific beneficial uses of estuarine habitat (EST) and preservation of biological habitats of special significance (BIOL). The Sediment TMDL analysis links three main factors to the impairment:

- Increased sedimentation within the Lagoon
- Increased freshwater flows to the Lagoon during the dry season when freshwater inflows historically would diminish to near zero
- Physical constraints (railroad berms, bridges) constructed around the Lagoon inlet

Increased sedimentation fills in channels and raises marsh elevations within the Lagoon. Combined with increased freshwater inflow, bathymetric alterations have shifted the eastern portion of the Lagoon from salt marsh to fresh/brackish marsh. Physical constraints throughout the watershed and within the lagoon inlet prevent channel meander, which historically has helped scour sediments from the Lagoon during high-flow periods. Physical constraints cause longer and more frequent Lagoon inlet closures. Caltrans has provided funds toward restoration that will include sediment removal from the Lagoon.

Prolonged inlet closures decrease marsh salinity by blocking tidal exchange and exacerbate other potential problems, such as bacteria, nuisance odors, and eutrophication. Sedimentation, increased elevations, and Lagoon inlet blockage also contribute to increased flood risk for adjacent urban developments, railroads, highways, and other infrastructure. Caltrans has provided an endowment to fund continued channel maintenance to ameliorate prolonged inlet closures.

¹ In 2010, when the sediment source assessment was developed for the TMDL, Caltrans did not own all of SR-56; much of it was owned by the City of San Diego.

1.3 Sediment Sources

Sediments enter the Los Peñasquitos Lagoon from watershed sources and from tidal inflow. Erosion of canyon banks, bluffs, surface soils, and scouring of stream beds and banks mobilizes watershed sediments that are transported to Los Peñasquitos Lagoon by storm flows. Human-caused changes to the landscape accelerate these natural processes. Development reduces perviousness, shortening the time of flow concentration and thereby increasing peak storm runoff velocities in response to rainfall events and increasing scour. Although this condition applies to historical developments in the Los Peñasquitos watershed, modern stormwater regulations manage hydromodification impacts from development². Development can also transiently increase soil exposure during construction, thereby increasing surface soil erodibility. Modern practices, such as erosion control requirements in the Construction General Permit³, ameliorate construction erosion. Caltrans has implemented watershed BMPs treating 1,651 acres, an area greater than its entire watershed footprint (1,515 acres).

This page intentionally left blank.

1.4 Sediment TMDL and WLA Assumptions

The Sediment TMDL includes key assumptions that drive the implementation actions of permitted entities responsible for achieving sediment load reductions to achieve the sediment waste load allocation (WLA):

- Contemporary watershed sediment loads are greater than pre-1973 watershed sediment loads.
- Habitat beneficial uses were attained in the Lagoon pre-1973.
- Achieving pre-1973 watershed sediment loads will lead to restoration of presently impaired beneficial uses of the Lagoon.

Assumptions about the total Caltrans footprint within the watershed and resulting load estimates help contextualize the Caltrans individual load reduction requirement (i.e., the WLA) with the entire watershed load reduction required under the TMDL. Project Initiation Report assumptions used to justify Caltrans funding Lagoon restoration relied on estimates that Caltrans would need to reduce sediments discharged from all Caltrans acreage in the watershed from the year 2000 estimate of 88 down to 48 tons of sediment per year⁴, i.e., reduction of about 45 percent from Caltrans' estimated year 2000 sediment load.

An estimated load of 88 tons per year discharged from 1,515 Caltrans acres implies an assumed average pre-treatment yield of 58 tons sediment per 1000 acres per year. GIS desktop analysis indicates that about half of Caltrans lands (768 acres) are paved. Paved areas have lower sediment yields compared to non-paved Caltrans areas and are therefore assumed to have yields of 30 tons sediment per 1000 acres per year for estimating pollutant load reductions. Non-Caltrans areas treated by BMPs are assumed to have pre-treatment erosive yields at least three-times higher than Caltrans lands (i.e., 174 tons per 1,000 acres per year).

The numeric targets and resulting WLAs in Table 1 summarize expected outcomes of the Sediment TMDL as it affects sediment dynamics of the Lagoon. Caltrans' load reduction requirement under the TMDL (48 tons sediment per year), is a small portion of the overall watershed load reduction (5,139 tons sediment per year).

⁴ Baseline sediment loads for Caltrans were calculated as the difference between the total watershed baseline sediment loads and the baseline sediment loads apportioned to the San Diego County Copermittees (Los Penasquitos Water Quality Improvement Plan (WQIP) Stakeholders, 2020). Caltrans believes that this method likely overestimated the year 2000 Caltrans load; thus, the 48 tons per year load reduction requirement is likely also an overestimate. However, 48 tons per year is used in this analysis for consistency as it is the most recent estimate presented to the SDRWQCB by stakeholders. Because of potential errors in the estimates of Caltrans lands used in prior estimates, the true Caltrans load and the load reduction required may be lower. The logic and numeric analysis presented in this memorandum would arrive at the same conclusion within the range of those uncertainties.

Table 1-1. Los Peñasquitos Lagoon Sediment TMDL Numeric Targets (tons of sediment per year)

Source	Year 2000 Load	Historical (mid-1970s) Load	Load Reduction	Percent Reduction
Watershed Contribution (WLA)	7,719	2,580	-5,139 (-48 Caltrans)	-67 %
Ocean Boundary (LA)	5,944	9,780	+3,836	+39%
Annual TMDL	13,663	12,360	-1,303	-10%

Notes:

LA = load allocation; TMDL = total maximum daily load; WLA = waste load allocation

Source: Draft Sediment TMDL Staff Report (SDRWQCB, 2012C); Adopted Sediment TMDL Resolution (SDRWQCB, 2012A)

Caltrans' load reduction requirement of 48 tons sediment per year cited in Table 1-1 is based on sediment load estimates developed by the Los Peñasquitos Stakeholders through the City's Water Quality Improvement Plan (WQIP) for the Los Peñasquitos Watershed (Los Peñasquitos WQIP Stakeholders, 2020). The load estimates follow the method of applying Caltrans' estimated land area (1,515 acres) and sediment yield assumptions based on land use, topography, and soil type to derive annual sediment loads.

1.5 Implementation Alternatives

The Sediment TMDL analysis focuses on sedimentation and reduction of watershed sediment loads because TMDLs are, by definition, pollutant-oriented control plans. Caltrans has prioritized attainment of the watershed load reduction requirement for Caltrans (48 tons sediment per year).

The SDRWQCB has also allowed for compliance via Lagoon restoration projects that achieve the salt marsh acreage numeric target. Caltrans has contributed to Lagoon restoration by funding the ongoing maintenance dredging of the Lagoon mouth and authorizing funds for Lagoon restoration, should the restoration project led by the City of San Diego proceed to construction.

2.0 FINDINGS

Caltrans has implemented sediment control BMPs and contributed to stakeholder-led Lagoon restoration sufficient to meet or exceed the watershed load reduction requirement of 48 tons sediment per year. Details in this section tell the story of how that was achieved and provide numeric analysis to support the conclusion.

2.1 Caltrans Sediment Control Actions

Caltrans has installed 16 structural BMPs within its right-of-way (ROW) and supported nonstructural BMP projects to address sediment loading and improve the quality of stormwater discharges in the Los Peñasquitos Watershed (Figure 2-1; Tables 2-1 and 2-2).

Notes:

Street sweeping not presented. Street sweeping activities take place on a routine basis on paved roadways within the Caltrans ROW.

* = Indicates future BMP implementation project

Figure 2-1: Caltrans Structural and Nonstructural BMPs in the Los Peñasquitos Watershed

Table 2-1: Caltrans Structural BMPs and Approximate Acres Treated

BMP Type	Number of BMPs Implemented	Estimated Number of Acres Treated		
		Caltrans ROW	Non-Caltrans ROW	Total
Structural BMPs in the Los Peñasquitos Watershed				
Sediment Basin	4	306	600	906
Detention Basin	3			
Retention Basin	1			
Bioswale	8			
Porous Pavement ¹	1			

Notes:

1. Indicates future project

Table 2-2: Caltrans Nonstructural BMPs and Approximate Treatment Acreage in the Los Peñasquitos Watershed

BMP Type	Number of BMPs Implemented	Estimated Number of Acres Treated		
		Operational ¹ Caltrans ROW	Non-Operational Caltrans ROW	Total
Nonstructural BMPs in Los Peñasquitos Watershed				
Dredging	1	Entire watershed ⁴		
Slope Repair and Stabilization	2 ²	10	0	10
Overplanting	1	4.6	0	4.6
Street Sweeping	NA	758 ³	0	758
Farmland Restoration	1	0	127	127
Nonstructural BMP Total Estimated Treatment Acreage				900

Notes:

NA = not applicable

1. Operational refers to roadways and other paved areas in active use by Caltrans.
2. Slope stabilization projects include one completed and one future project.
3. Street sweeping occurs on Caltrans paved roadways. Total acreage is derived from the total estimated Caltrans acreage within Los Peñasquitos Watershed (1,515 acres); approximately 50 percent of the Caltrans ROW is paved.
4. Dredging the Lagoon treats sedimentation in the Lagoon resulting from processes occurring throughout the watershed, Lagoon, and inlet to the Pacific Ocean.

Structural BMPs consist of four sediment basins, three detention basins, one retention basin, and eight bio-infiltration swales (bioswales). Caltrans has plans to construct a segment of porous pavement parking lot near the Interstate 5 and State Route 56 interchange, for a total of 17 structural BMPs within the watershed treating 907 acres

(Table 2-1). Drainage areas for structural BMPs are shown in Figure 2-2. Nonstructural BMPs include annual Lagoon mouth dredging, slope repair and stabilization, overplanting activities on non-roadway property, routine street sweeping, and farmland restoration (Figure 2-1; Table 2-2).

Figure 2-2: Drainage Delineation of Caltrans Structural BMPs in the Los Peñasquitos Watershed

The numeric analysis in Table 2-3 shows that the approach of treating Caltrans lands to the maximum extent practicable (MEP) combined with treating areas outside of Caltrans jurisdictions achieves watershed sediment load reductions above and beyond the Caltrans WLA estimate of 48 tons per year. The table assumes that BMPs implemented on non-Caltrans lands provide greater sediment load reductions compared to Caltrans lands because paved Caltrans lands mostly have very low sediment yields. Projects on non-Caltrans lands were selected because they have higher erosive sediment yields and therefore provide relatively greater sediment load reductions. The estimates of Table 2-3 use the conservative assumption that non-Caltrans lands have yields at least five-fold greater than Caltrans lands.

Table 2-3: Estimated Load Reductions by BMPs on Caltrans and Non-Caltrans Lands in the Los Peñasquitos Watershed

BMP Treatment	% Red. ¹	Caltrans			Non-Caltrans			Total Annual Load Reduction (tons/yr)
		Pre-treatment yields (tons/1000 acres/yr) ²	Area treated (acres)	Loads reduced ³ (tons/yr)	Pre-treatment yields ² (tons/1000 acres/yr)	Area treated (acres)	Loads reduced ³ (tons/yr)	
Structural	50%	58	306	8.9	174	600	52.2	
Nonstructural	50%	58	14.6	0.4	174	127	11.0	
Street sweeping	20%	29	758	17.6	--	--	--	
Subtotal				27	Subtotal		63	90

Notes:

1. Percent sediments load reduced assumptions are based on conservative estimates for the Structural BMPs documented in Caltrans pilot studies (Caltrans 2004) and nonstructural BMPs established in Caltrans standard design guidance (Caltrans, 2019)
2. Pre-treatment yields on Caltrans and non-Caltrans lands as explained in Section 1.4 above
3. Loads Reduced = Pre-treatment yields x Area treated x % Reduction

Estimated sediment reductions by Caltrans BMPs in the watershed (90 tons per year) exceed Caltrans' watershed load reduction goal (48 tons per year) because of treatment in non-Caltrans lands (63 tons per year). This finding would apply regardless of refinements to assumed Caltrans watershed loads and load reduction requirement. Even if structural BMPs achieved half the values assumed in Table 2-3 Caltrans would achieve its WLA. The strategy of treating Caltrans lands to the MEP and implementing partnerships to achieve load reductions from high sediment-generating lands outside Caltrans' jurisdiction has achieved the sediment TMDL WLA for Caltrans in the Los Peñasquitos watershed.

Caltrans' partnerships to support Lagoon restoration provide added value benefits towards achieving TMDL waste load allocations and salt marsh habitat numeric targets for beneficial uses. Those efforts also address TMDLs and impairments for other pollutants (e.g., bacteria) in the Lagoon.

2.2 Caltrans Financial Contributions to Lagoon Restoration

Caltrans has approved funding contributions exceeding its fair share of percentage of watershed ownership to Phase I of the Los Peñasquitos Lagoon Enhancement Plan (Lagoon Enhancement Plan) being led by the City of San Diego (Caltrans, 2021). The funding supports sediment management and habitat restoration actions that directly address Sediment TMDL numeric targets and WLAs by removing sediment via channel

maintenance and increasing salt marsh habitat through freshwater management actions.

The request for State Highway Operation and Protection Program (SHOPP) funds approved by Caltrans includes a letter from the SDRWQCB granting 45.14 compliance unit (acres) credits for a \$4-million-dollar endowment Caltrans made available for long-term Lagoon mouth maintenance in 2017 (Caltrans, 2021, Attachment N). The letter states that the SDRWQCB would consider participation in Phase I Lagoon restoration for compliance with WLAs. Comparison of Lagoon sediment-removing restoration actions with sediment numeric WLAs helps credit Lagoon restoration in terms of sediment load.

2.3 Approach for Crediting Lagoon Restoration

Sediment removal actions from Lagoon restoration help advance Sediment TMDL goals. Table 2-4 presents Lagoon restoration outcomes for comparison with Sediment TMDL numeric targets. Caltrans has funded an Endowment Management Agreement to make \$4 million available for Lagoon mouth maintenance at \$150,000 per year (Caltrans, 2021, Attachment N). The amount of sediment removed from this action alone is comparable to Caltrans' load reduction goal of 48 tons sediment per year (i.e., about 2-3 truckloads of sediment per year). Continued maintenance of the Lagoon addresses multiple pollutant impairments, such as bacteria, as noted by the SDRWQCB (Caltrans, 2021, Attachment N).

Concept 2 (Freshwater Management Only) in Table 2-4 aligns with the Phase I action funded by Caltrans (Caltrans, 2021). Removing 20,700 tons of sediment under Concept 2 would result in the same mass as achieving 4 years of required watershed load reduction (5,139 tons per year). The Sediment TMDL outcomes expected include reducing net sediment deposition by approximately 1,300 tons per year. Removing 20,700 tons of sediment under Concept 2 would result in the same sediment mass as achieving a 1,300-ton reduction in net annual sediment deposition for 16 years. In comparison to Caltrans 48 tons per year requirement, reducing 20,700 tons of sediment in total is equivalent to 431 years of compliance.

Framed another way, if Lagoon Restoration Concept 3 were to be completed removing 99,700 tons of sediment from the Lagoon, Caltrans credit for contributing 5.7 percent of funding would be 5,700 tons, or more than 100 years of compliance with the 48 ton / year load reduction expected of Caltrans.

The Lagoon Management Plan also relates restoration actions to acres of salt marsh restored. The last column of Table 2-4 shows how different Lagoon restoration alternative relate to the TMDL numeric target of 346 acres salt marsh restored. Caltrans has authorized \$2 million to support Phase I implementation of the Lagoon Enhancement Plan when the project is ready for construction. Caltrans' financial participation in Lagoon restoration follows the spirit and letter of compliance with the TMDL numeric target of "an

increasing trend in the total area of tidal and non-tidal saltmarsh toward 346 acres" (SDRWQCB, 2012a).

Table 2-4: Summary of Predicted Sediment Removed and Salt Marsh Cares Restored by the Los Peñasquitos Lagoon Management Plan

Item		Quantity (tons)	Acres Salt marsh Achieved by 2070 ³
Annual watershed sediment load reduction ¹		5,139	346
Annual net reduction of Lagoon sediment deposition ¹		1,303	
Sediment mass removed ³	Concept 1 (No project) ²	Channel maintenance only	161
	Concept 2 (Freshwater management only)	20,700	293
	Concept 3 (Elevation reduction only)	79,000	165
	Concept 4 (Freshwater management and elevation reduction)	99,700	312

Notes:

1. From SDRWQCB (2012A and 2012C) as summarized in Section 1.6 and Table 1-1.
2. Under the no project action, it is assumed that \$150,000 per year will be spent on channel maintenance funded by Caltrans.
3. Based on excavation estimates from Tables 7-4, 7-7, 7-10, and 7-14 of the Final Los Peñasquitos Lagoon Enhancement Plan (Los Peñasquitos Lagoon Foundation, 2018). Conversion from cubic yards to tons based on assumed bulk density of 0.48 gram per cubic centimeter (San Francisco Estuary Institute, 2020).
4. From Tables 7-15, 7-16, and 7-17 of the Final Los Peñasquitos Lagoon Enhancement Plan (Los Peñasquitos Lagoon Foundation, 2018).
5. Construction excavation volumes and costs have increased since the 2018 Concepts were developed (City of San Diego, 2021)

2.4 Caltrans Monitoring Approach

Caltrans recognizes the importance of sediment load management in Los Peñasquitos. The Los Peñasquitos Sediment TMDL was adopted after the implementation of the existing Caltrans NPDES Permit; therefore, Caltrans is not currently required to perform monitoring activities in the Los Peñasquitos Watershed. As such, Caltrans has focused monitoring efforts in other TMDL watersheds while concentrating financial resources to Lagoon restoration efforts in Los Peñasquitos.

The 2021 draft Caltrans NPDES Permit encourages cooperative and regional watershed monitoring programs to attain TMDL monitoring requirements and achieve WLAs. Caltrans supports collaboration with the existing stakeholder-led receiving water

monitoring program of Los Peñasquitos Lagoon and its tributary watersheds moving forward. Caltrans believes that participation in the stakeholder-led monitoring program is the best use of resources and provides meaningful data to address watershed-based WLAs.

This page intentionally left blank

3.0 CONCLUSIONS AND RECOMMENDATIONS

In summary, analysis of the compiled information on structural and nonstructural BMPs implemented by Caltrans in the watershed shows that Caltrans' proactive compliance in the Los Peñasquitos Lagoon watershed has more than achieved the 48 tons per year watershed sediment load reduction required for compliance with the Sediment TMDL. Conservative estimate show that reductions on Caltrans lands of 27 tons per year combined with reductions of 63 tons per year on non-Caltrans lands achieved a total reduction of 90 tons per year. Caltrans' financial participation toward Lagoon restoration goes above and beyond the minimum requirements to provide reasonable assurance of Caltrans compliance with the TMDL.

Caltrans recommends that monitoring BMP effectiveness in the watershed is not necessary because the standard BMPs implemented are known to work and the findings of attainment are robust to effectiveness assumptions. In lieu of implementing an individual monitoring program of stormwater discharges from Caltrans ROW and treatment facilities, Caltrans supports collaborative participation in stakeholder-led monitoring of the Lagoon and the watershed by providing a fair share contribution to the cost of monitoring.

Caltrans recommends that the SDRWQCB communicate a response to this memorandum confirming that Caltrans has achieved its TMDL WLA for the Los Peñasquitos Watershed.
