

Appendix H1a3

Sacramento Water Allocation Model Results for Updated Unimpaired Flow Scenarios

H1a3.1 Introduction

This appendix summarizes results from the Sacramento Water Allocation Model (SacWAM) for model scenarios that represent changes in hydrology and water supply that could occur as a result of the regulatory pathway of the revised proposed Plan amendments described in Chapter 13, *Revised Proposed Plan Amendments*. Model scenarios presented in this appendix were built upon similar scenarios documented and analyzed in the 2023 *Draft Staff Report/Substitute Environmental Document in Support of Potential Updates to the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary for the Sacramento River and its Tributaries, Delta Eastside Tributaries, and Delta* (2023 Draft Staff Report), and reflect subsequent model updates and a new scenario described in Appendix H1a, *Sacramento Water Allocation Model Methods*.

Results summarized in this appendix include updated unimpaired flow scenarios ranging from 35% to 65% of unimpaired flow (UF), labeled “35,” “45,” “55,” and “65,” and the 55% UF with water supply adjustments (WSAs) scenario, labeled “55 w/WSAs” in the summary of results that follows. Additionally, results are presented for the baseline scenario, labeled “Baseline,” used throughout the Staff Report to represent hydrological and water supply conditions associated with the project baseline described in Chapter 6.2.1, *Baseline Conditions*, and Chapter 7.1.5.2, *Baseline, Evaluation Approach, and Modeling Tools*.

Please refer to Chapter 6 and Appendix A1 for discussions of the approach to modeling baseline and percent unimpaired flow scenarios. Please refer to Appendix H1a for a discussion of model updates since the 2023 Draft Staff Report and to Chapter 13.4.2 and Appendix H1a for a description of model assumptions for the 55% UF with WSAs scenario.

All results presented in this appendix were produced using the model version SacWAM_2025.08.28 using historical hydrology for the period of record of water years 1922 through 2021. Because the “Current Accounts” year of 1922 is identical for all years within a given version of SacWAM, results are reported for water years 1923 through 2021.

H1a3.2 Streamflows

Simulated streamflow data are presented for each location where new SWRCB instream flow requirements were added to the model and for other locations that may be of interest along the Sacramento River. For each location, a monthly boxplot is presented followed by tables of cumulative distributions for each scenario and results summarized by water year type.

H1a3.5 Reservoir Storage

SacWAM dynamically simulates storage regulation in most major reservoirs in the Sacramento Valley and Delta Eastside Tributaries. Storage in smaller reservoirs, including regulating reservoirs that act as forebays and afterbays, are typically not simulated, although they may be represented in the model schematic. Storage in these smaller reservoirs is usually kept constant. For some mid-size reservoirs, storage is constrained to follow historical average monthly values. Reservoirs represented in the model but having storage that does not change in any of the scenarios are considered non-reoperated reservoirs. Results for non-reoperated reservoirs with constant end-of-April and end-of-September storage are listed in Table H1a3-133. Results for these reservoirs are not presented further. Farmington Reservoir and Schaads Reservoir do not store water in SacWAM as currently configured.

Reservoirs that exhibit interannual variability in end-of-April or end-of-September storage but show less than or equal to one percent change from baseline storage during April or September are listed in Table H1a3-134. Reservoirs that exhibit greater than one percent change from baseline storage during April or September are listed in Table H1a3-135.

Results for other reservoirs listed in Tables H1a3-134 and H1a3-135 are presented as end-of-April storage and elevation and end-of-September storage and elevation. SacWAM contains storage-elevation relationships for most of the reoperated reservoirs, allowing average annual fluctuation in reservoir elevation to be calculated as the average of the annual maximum minus minimum water surface elevations (Table H1a3-136).

Table H1a3-133. Non-reoperated Reservoirs with Constant End-of-April and End-of-September Storage (TAF).

Reservoir	Watershed	End-of-April
Belden Reservoir	Feather	2.4
Buck Island	American	1.1

H1a3.6 Water Supply

In this section, SacWAM results for water supply are presented by water budget area (WBA), other logical groupings of demand sites within the model domain but outside of the valley floor (upper watershed and foothill, San Francisco Bay Area), CVP contract type, and SWP contract type. The values presented by WBA include total water supplied, including surface and groundwater to the demand locations by water year. Results presented for CVP and SWP deliveries only include surface supplies and are also summarized by water year. All water supply results are presented as simple aggregations of transmission link flows to the set of demand sites identified for each summary. WBAs in the Sacramento Valley include water delivered to SWP and CVP contractors in those WBAs.

Water supplies for many demand site groups remain essentially unchanged among the model scenarios presented here. The WBAs and other demand site groups identified in Table H1a3-325 show constant supplies for all water years in all scenarios summarized, and are not presented further in this appendix.

Table H1a3-325. Water Budget Areas and Demand Site Groups with Constant Supply in all Water Years of all Scenarios.

H1a3.8 Unmet Instream Flow Requirements

Unmet instream flow requirements are presented as a count of months and percent of months in which the flow requirement was not met. There are a total of 1,188 months in the 1923–2021 simulation period presented here, though many instream flow requirements are not in effect in every month of the simulation period. The flow requirement was considered unmet if the shortfall was greater than 5% of the monthly requirement. Results are presented for “REG” flow requirements, which represent existing regulatory flow requirements. The VA scenario makes use of a subset of “SWRCB” flow requirements (SWRCB Camanche, SWRCB Folsom, SWRCB Delta, SWRCB Putah Creek, and SWRCB Sacramento at Knights Landing) as well as REG High Flow Channel to implement VA flow requirements. These requirements are always met in the VA scenario.

Table H1a3-477. Number of Months (Percent of Months) with Unmet REG Instream Flow Requirements

Requirement	Baseline	35	45	55 w/WSAs	55	65
REG American River at Fair Oaks	3 (0)	0 (0)	0 (0)	0 (0)	0 (0)	3 (0)
