

PRECAUTIONARY CONSIDERATIONS REGARDING THE UNUSED EXPORT CAPACITIES
 AT SWP BANKS AND CVP TRACY PUMPING PLANTS
 RESULTING FROM THIS DWRSIM STUDY 1995C6B-SWRCB-409.MONT

DWRSIM Study 1995C6B-SWRCB-409.MONT is a preliminary Operation Study completed to assess the water supply impacts of the State Water Resources Control Board Draft Water Quality Control Plan of December 15, 1994. Not all of the criteria required in the Plan are modeled in this DWRSIM study. The modeled criteria and the excluded criteria have been summarized in a separate document. In addition, the following modeling assumptions/limitations should be particularly noted, because alternative assumptions could change the amount of unused export capacities at SWP Banks and CVP Tracy Pumping Plants:

- o CVP/SWP System is used as surrogate to estimate water supply impacts and meet draft plan standards. The actual allocation of impacts during water rights proceedings is yet to be determined.
- o Combined CVP plus SWP Delta export demand ranges between 5.9 MAF/yr and 6.9 MAF/yr in this study, depending on Southern California wetness indexes. If projected future CVP plus SWP demands (up to 7.4 MAF/yr) were modeled, then the resulting amount of unused export capacity would be smaller.
- o The model uses existing COA percentages for sharing surplus flows and storage withdrawals for in-basin use (55/45 and 75/25), including X2 requirements. However, export limitations due to export/inflow ratio requirements are not specified under the present COA. An arbitrary sharing ratio of 50/50 (SWP/CVP) was used in this Model Study whenever the export/inflow ratio controlled operations. The actual allocation of impacts will depend upon re-negotiation of project responsibilities and rights under the COA.
- o For the proposed Delta inflow/export ratio criteria, Total Delta Exports are modeled as the sum of pumping at the SWP Banks and CVP Tracy Pumping Plants. Contra Costa Canal and North Bay Aqueduct diversions are not included in this DWRSIM study.
- o Wheeling of CVP water through the SWP Banks Pumping Plant is allowed in this Operation Study to meet the CVP Cross Valley Canal demands; only when there is unused capacity available at the Banks Pumping Plant and if CVP needs the wheeling help.
- o The SWRCB's four-page "Errata to the December 1994 Draft Bay-Delta Plan" are not modeled in this DWRSIM study. The inclusion of these changes and corrections could alter the DWRSIM model results, including the unused Delta export capacity.
- o The DWRSIM model simulates the operation of CVP and SWP system reservoirs and conveyance facilities on a monthly basis. It is necessary to make simplifying assumptions to translate proposed standards for portions of a month into average full-month requirements for use in the model.

DESCRIPTION OF ENCLOSED TABLES

TABLES 1 and 2 provide information on the pumping plant capacities, as modeled on a monthly basis in DWRSIM. The unused capacities in these two tables are calculated as capacity at the pumping plant minus actual monthly pumping; without considering the limitations of proposed Bay-Delta Plan standards.

TABLE 3 (FINAL RESULT) represents the calculated estimate of combined unused capacity for SWP Banks plus CVP Tracy Pumping Plants, after reductions to account for the limitations imposed by Draft Bay-Delta Plan criteria. The specific criteria which affect the unused capacity calculation are the Delta Inflow/Export Ratio criteria, and the April/May export limitation as a function of San Joaquin River flow at Vernalis.

TABLE 1: SWP BANKS PUMPING PLANT (STUDY 1995C6B-SWRCB-409.MONT)

(TAF UNITS)

USCE PERMIT CAPACITY:	OCT	NOV	DEC	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	TOTAL
	409	397	467*	523*	472*	467*	394	411	397	411	403	392	5143

/ * For Dec15-Mar15, USCE Permit capacity varies by year as a function of flow at \
 \ Vernalls. Maximum value is capped at 8500 cfs, as indicated above. /

BANKS PP UNUSED CAPACITY (UNADJUSTED - BASED ONLY ON USCE PERMIT CAPACITY)
